Presiding over the eighth annual general meeting, on July 15, Sir Harry McGowan, K.B.E., said that the company had every reason to congratulate themselves on the results for the year, more especially in view of the protracted coal stoppage, which had naturally affected their home trade, particularly in explosives. Apart from explosives, the return from constituent and associated companies had been well maintained. The company's general export trade had been well maintained, their Continental investments continued to do well, and highly satisfactory progress was being made by their interests in Australia, South Africa, and Canada. The splendid results achieved by the General Motors Corporation in 1925 were exceeded in 1926; the total net earnings, including equities in subsidiaries, amounted to \$178,000,000, compared with \$116,000,000 for 1925. With regard to the formation of Imperial Chemical Industries, Ltd., the Nobel Company possessed financial strength and commercial ability, but he was more than ever convinced of the wisdom of the recommendation made to the shareholders seven months ago. The merger of the various companies forming Nobel Industries, Ltd., effected in 1918, had fully justified itself. They could not, however, stand still, but must go either forward or backward, and by becoming partners in the amalgamation constituted by the formation of Imperial Chemical Industries, Ltd., the directors felt that they were forwarding not only the interests of the shareholders, but also those of the general community and of the Empire as a whole. The invitation to shareholders to exchange their shares for those of Imperial Chemical Industries, Ltd., had met with almost unanimous and immediate response, and at the present time only 1.1% of the share capital of Nobel Industries was unexchanged, and of the four participating companies over all less than 1.2% was outstanding. Of those a large proportion was represented by holdings abroad and executorship accounts, the legal formalities in connexion with which, although involving delay, were gradually being cleared up and exchanges effected. [For details of the accounts, see CHEM. AND IND., July 15, 1927, p. 649.]

BRUNNER, MOND AND CO., LTD.

An interim dividend of 2% less tax, has been declared, which compares with an interim of 3½% for each of the three preceding years on the ordinary capital, during which period the latter has been raised from £9,697,591 to £9,787,900.

DISTILLERS CO., LTD.

The fiftieth annual general meeting was held on July 15, Mr. William H. Ross, chairman, presiding. After providing for depreciation, the gross revenue amounted to £43,700 less than the previous year; but income tax required £44,000 less, and general management and office expenses were down by £5600, which made the net result £6000 better than the previous year. With

£5000 brought forward, there was an available sum of £11,000. The company were progressing with their experiments to provide an alternative motor fuel, and a field had been found in Northern Queensland where the raw material required could be obtained in considerable quantities at the minimum of cost. A distillery had been erected there which would be followed by others as soon as the first one had proved a success. The directors had acquired a 50% interest in a new distillery situated near Montreal in Quebec, which is already in operation. With regard to the alcohol distillery in Queensland, which had been erected in conjunction with members of the sugar industry, as there was no demand for molasses in such a sparsely populated country, it was now made into an alcohol fuel which was proving quite satisfactory. The supply of alcohol fuel for motor-cars was entirely a question of cheap raw material and its consumption within a reasonable distance of where it was produced, although it could not, at present, compete with the supplies of petrol provided by nature.

CASSEL CYANIDE CO., LTD.

The offer to exchange Cassel Cyanide shares for shares in Imperial Chemical Industries (cf. CHEM. AND IND., July 8, 1927, p. 620) has been accepted by over 80% of the shareholders. The offer was conditional upon 75% of the shareholders accepting.

W. AND H. M. GOULDING

This firm of chemical manure manufacturers recommends a dividend at the rate of 5½% on the preference shares and 5% per annum on the ordinary shares for the year ended June 30, 1927.

DUNLOP RUBBER CO., LTD.

The directors have entered into a provisional arrangement with the Dunlop Rubber Co. of Australasia providing for the financial association of the two companies and the closest possible technical and commercial alliance. The arrangement includes the acquisition of a share interest in the Australian Company by the Dunlop Rubber Co., and representation on the Board and the formation of a separate New Zealand Company jointly owned by the two companies.

WELSBACH LIGHT CO., LTD.

The trading profit for the year to March 31, 1927, was £10,419, after meeting expenses and advertising etc., compared with £1211 for the preceding year. After meeting repairs and depreciation, £3979 (against £3371), and providing legal expenses, directors' fees and interest on debenture stock, the net profit was £6620, compared with £3021. A dividend is proposed of 5% (same as for each of the four preceding years), leaving £1323 to be carried forward, against £10,599 brought in.

MIDLAND BANK, LTD.

The balance sheet for the year ended June 30, 1927, shows a further expansion in business and assets. Deposits, including balance of profit and loss account, now stand at £376,528,502, as against £349,460,874 a year ago, and £368,160,062 at December last. The paid-up capital amounts to £12,665,798, and the reserve fund stands at the same amount. Investments total

£37,128,551, compared with £33,469,941 at June, 1926, and £38,853,582 at December, 1926.

CHEMICAL AND METALLURGICAL CORPORATION, LTD.

The seventh report states, with reference to the acquisition of a site for the company's works on the Manchester Ship Canal, that good progress has been made in the erection of the plant, which will include apparatus for the independent production by the company of hydrochloric and sulphuric acids, which are necessary in the ore reduction processes. The experimental works at Stratford, E., have continued to operate, a great variety of complex ores having been treated successfully.

CELANESE CORPORATION OF AMERICA

At a special meeting of the holders of the first mortgage ten-year 8% convertible sterling bonds on July 18, resolutions were passed assenting to an increase in the shares of the capital stock from 1,130,000 shares, consisting of 150,000 shares of a par value of \$100 each of 7% cumulative first participating preferred stock, 100,000 shares of the par value of \$100 each of 7% cumulative second preferred stock, and 880,000 shares without par value of common stock, to 1,400,000 shares to consist of 250,000 shares of the par value of \$100 each of prior preferred stock, 150,000 shares of the par value of \$100 each of 7% cumulative first participating preferred stock, and 1,000,000 shares without par value of common stock.

ELECTROLYTIC ZINC CO. OF AUSTRALASIA

A dividend has been declared at the rate of 12% per annum for the six months ended June 30 last on the whole of the preference and ordinary shares, payable on September 1.

COURTAULDS, LTD.

The directors have decided to restore the rate of dividend to 7½% actual, free of tax, a gain of 1¼% on last year's interim, and the same as paid in the preceding year.

JOHN KNIGHT, LTD.

A dividend has been declared on the 25% cumulative preferred ordinary shares at the rate of 12½% for the half-year to May 31, 1927.

COMMERCIAL GAS CO., LTD.

The directors state that by the passing of the Companies Act, 1927, the distinction between the 4% capital stock and the 3½% capital stock no longer exists. The combined stocks will henceforth be known as ordinary stock, and the directors have declared an interim dividend on such ordinary stock for the half-year ended June 30, 1927, of 2½% (actual) less tax, payable on August 15.

BRITISH OXYGEN CO., LTD.

A final dividend has been recommended for the year ended March 31, 1927, of 5½%, less tax, making 8%, less tax, for the year.

ASSOCIATED FIRECLAY COMPANIES

An interim dividend of 5%, less tax, has been declared on the ordinary shares, payable on July 30.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 80s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.

Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £8 10s.—£9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£6 15s.—£10 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 9d.—4s. per gal., 60% O.P. Solvent, 3s. 11d.—4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£40 15s.—£41 10s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 4d.—2s. 8d. per gal.
 Acid Cresylic, 99/100.—2s. 8d.—2s. 9d. per gal. 97/99.—2s. 1½d.—2s. 4½d. per gal. Pale, 95%, 2s.—2s. 3d. per gal. Dark, 1s. 9d.—2s. 1d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 11d.—1s. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 2d. per gal., ex works in tank wagons; Pure, 1s. 7d.—2s. 3d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 8d.—1s. 10½d. per gal. Pure, 2s.—2s. 3½d. per gal.
 Xylol.—2s.—2s. 4d. per gal. Pure, 2s. 6d. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—8½d. per gal. Middle Oil, 7½d.—7¾d. per gal. Heavy, 8½d.—8¾d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/100, 1s. 5d.—1s. 6d. per gal. Solvent 95/100, 1s. 5d.—1s. 6d. per gal. Solvent 90/190, 11d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—80s.—85s. per ton, f.o.b. according to district. Nominal.
 Pyridine.—90/140.—7s.—13s. per gal. Nominal. 90/180.—4s. 6d.—5s. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winter.—4s. 9d. per lb. 100% basis d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzdine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%—3s. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum 1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—5 cwt. lots. Cryst. 41s. per cwt. Powder 45s. per cwt. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 8d.—1s. 10d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 3½d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 9d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—5 cwt. lots. Crystal 25s. per cwt. Powder 27s. * per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d. per lb. Potassium.—1s. 11d. per lb. Sodium.—2s. 2d. per lb. Granulated ½d. per lb. less. All spot.
 Calcium Lactate.—1s. 3½d. per lb.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—1 lb., 16s. per doz.; ½ lb., 9s. 6d. per doz.; ¼ lb., 6s. 6d. per doz.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 11s.—14s. 6d. per lb., according to quantity; Liquid (95%), 12s. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—6s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—50s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—92s. 6d.—97s. 6d. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kogs included.
 Sulphonal.—6s. 6d.—6s. 9d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Puriss.—10s. 6d.—10s. 9d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
 Aubepine (*ex Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 6d. per lb.
 Ethyl Cinnamate.—6s. 6d. per lb.
 Ethyl Phthalate.—2s. 9d. per lb.
 Eugenol.—9s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanilin.—17s.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.
 Camphor.—70s. per cwt. Cananga, Java, 26s. per lb. Cassia, 80/85%.—8s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%, 22s. 6d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 18s. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Sept. 10th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on July 28th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Harter. Carrying out exothermic gas reactions. 17,750. July 4.
 Hawes. Evaporating apparatus. 18,195. July 8.
 Hermansen. Tunnel kilns. 18,101. July 7.
 Jørgensen. Producing homogeneous mixtures of pulverulent materials. 17,749. July 4. (Denmark, 2.7.26.)

Marks (Susquehanna Collieries Corp.). Separation of subdivided materials. 18,104. July 7.

Nobel. Extracting substances from solid materials. 17,695. July 4.

Pulp Economisers, Ltd., and Smith. Filtering apparatus. 18,070. July 7.

Williams. Furnaces. 18,272. July 9.

I.—Complete Specifications

12,447 (1926). Foray. Apparatus for extracting essential principles. (252,190.)

8493 (1926). Heitmann. Producing lubricants containing water. (250,562.)

9041 (1926). Amdyco Corp. Extinguishing fire. (250,924.)

17,436 (1926). Denham, and Simon, Ltd. Grinding or disintegrating machines. (273,499.)

18,633 (1926). I.-G. Farbenind. Manufacture of active adsorbent and catalytic masses. (255,904.)

26,661 (1926). Soc. L'Air Liquide. Carrying out exothermic chemical reactions under pressure and at a high temperature. (268,721.)

5694 and 5773 (1927). Deutsche Gasglühlicht Auer-Ges. Indicating the exhaustion of substances used for cleaning gases. (272,855 and 272,858.)

*14,347 (1927). Kehren. Furnaces. (273,671.)

*16,474 (1927). Krupp Grusonwerk. Apparatus for expressing liquid constituents from materials. (273,689.)

*17,622 (1927). I.-G. Farbenind. Manufacture of aqueous solutions of organic compounds insoluble in water. (273,757.)

*17,749 (1927). Jørgensen. Producing homogeneous mixtures of pulverulent materials. (273,768.)

II.—Applications

Cassel Cyanide Co., Ltd., and Ewan. Manufacture of carbon from carbon monoxide. 17,786. July 5.

Imperial Chemical Industries, Ltd., and Gordon. Production of gaseous fuels. 18,140. July 8.

Okell. Activating carbonaceous materials. 17,879. July 5.

Power Gas Corporation, Ltd., and Rambush. Water-gas plant. 17,949. July 6.

Rozinek and Szikle. Gasification of fuel. 18,234. July 8. (Ger., 9.7.26.)

Steel Bros. & Co. (Armstrong). Purification of wax residues of petroleum. 18,185. July 8.

II.—Complete Specifications

2075 and 30,519 (1926). Burmah Oil Co., Ltd. (Fraser). Refining mineral oils and/or their distillates. (273,351.)

8285 (1926). Fischer and Tropsch. Production of paraffin hydrocarbons. (255,818.)

8590 (1926). Davidson. Distillation of solid carbonaceous substances. (273,389.)

12,462 (1926). Allgem. Ges. f. Chem. Industrie. Expelling the SO₂ gases from mixtures of SO₂ gases and oil. (269,118.)

15,421 (1926). West, West, and West Gas Improvement Co., Ltd. Vertical retort. (273,474.)

22,791 (1926). Salerno, Ltd., and Salerni. Distillation or heat treatment of carbonaceous or like materials. (273,528.)

27,234 (1926). Shimamoto. Treating pulverised vegetable fuels. (273,556.)

32,019 (1926). Siemens & Halske A.-G. Improving mineral oils and tar products. (263,186.)

5694 and 5773 (1927). Deutsche Gasglühlicht Auer-Ges. See I. 11,700 (1927). Coppee & Co. Coke oven. (273,630.)

*15,926 (1927). Verein f. Chem. Industrie. Producing or reactivating active carbons. (273,683.)

*17,093 (1927). I.-G. Farbenind. Manufacture of liquid products from coal, tars, mineral oils, and the like. (273,712.)

*17,657 (1927). Algem. Norit Maatsch. Producing activated carbon. (273,761.)

III.—Complete Specifications

- 17,169 (1926). Irinyi. Producing benzene by reaction between phenolic vapours and a reducing gas. (273,493.)
 32,019 (1926). Siemens & Halske A.-G. See II.
 *15,252 (1927). Wessel. Distillation of coal tar. (273,675.)
 *17,093 (1927). I.-G. Farbenind. See II.

IV.—Applications

- Carpmael (I.-G. Farbenind.). Manufacture of tetra-kisazo dyestuffs. 17,967. July 6.
 Hoffmann-La Roche & Co. Manufacture of alkyl and aralkyl derivatives of diphenolisin. 18,150. July 8. (Switz., 9,10,26.)
 I.-G. Farbenind. Manufacture of α -anthraquinonyl ketones. 17,864. July 5. (Ger., 5,7,26.) Manufacture of cyclic ketones. 18,068. July 7. (Ger., 8,7,26.) Manufacture of naphthalene-1,4:5:8-tetracarboxylic acid. 18,184. July 8. (Ger., 9,7,26.)
 Imray (I.-G. Farbenind.). 18,199. See XX.
 Johnson (I. G. Farbenind.). Manufacture of vat dyestuffs. 18,074. July 7.

IV. Complete Specifications

- 32,603 (1925). Thomas, Drescher, and Scottish Dyes, Ltd. Dyestuff intermediates. (273,347.)
 2143 (1926). Bloxam (I.-G. Farbenind.). Manufacture of diazo-preparations. (273,352.)
 8496 (1926). I. G. Farbenind. Manufacture of halogenated benzanthrone derivatives containing sulphur. (249,890.)
 8497 (1926). I.-G. Farbenind. Manufacture of condensation products of the benzanthrone series and of vat dyestuffs containing nitrogen. (249,891.)
 17,169 (1926) Irinyi. See III.
 19,565 (1926). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (258,563.)
 *6307 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (273,656.)
 *12,103 (1927). I.-G. Farbenind. Manufacture of condensation products from naphthalene and derivatives. (273,665.)
 *17,864 (1927). I.-G. Farbenind. Manufacture of α -anthraquinonyl ketones. (273,774.)

V. Applications

- Benthall, Bird & Co., Godfrey, Spencer, Tarlton, and Wheeler. Extracting cellulose etc. 17,832—3 and 18,148. (Br. India, 20,1,27 and 28,5,27.)
 Comp. Gén. des Industries Textiles, and Duhamel. Washing wool. 18,167. July 8. (Fr., 4,5,25.)
 Lescurre. Sterilising fabrics. 18,328. July 9. (Fr., 1,3,27.)
 Lilienfeld. Manufacture of artificial threads. 17,713. July 4.
 Lucas, and Vickers, Ltd. Treatment of flax etc. 17,838. July 5.
 McCaw. Treatment of textile fibres etc. 17,898. July 6.
 Rheinische Gummi- und Celluloid-Fabr. Treating celluloid scrap. 18,255. July 9. (Ger., 18,9,26.)
 Sever and Speakman. Manufacture of artificial textile fibres. 18,203. July 9.
 Silver Springs Bleaching and Dyeing Co., Ltd., and Hall. Process for treating viscose silk etc. 18,274. July 9.

V.—Complete Specifications

- 9197 (1926). Benckiser, Reimann, Reimann, and Draibach. Maintaining effectiveness of washing and bleaching powders. (273,414.)
 18,031 (1926). Courtaulds, Ltd., Hegan, and Hazeley. Manufacture of threads, filaments, etc. from viscose. (273,506.)
 8521 (1926). Courtaulds, Ltd., Glover, and Heaven. Manufacture of filaments of artificial silk etc. (273,386.)

- 8865 (1926). British Celanese, Ltd., Dickie, and Halkyard. Manufacture of fabrics. (273,406.)
 *16,585 (1926). British Celanese, Ltd., Rivat, and Cadgène. Treatment of cellulose derivatives. (273,692.)
 *10,998 (1927). Wells. Cooking vegetable fibre. (273,663.)
 *17,523 (1927). British Celanese, Ltd. Manufacture or treatment of cellulose derivatives. (273,743.)
 *17,585 (1927). Duhamel, and Comp. Gén. des Industries Textiles. Washing or cleaning wool. (273,755.)

VI. Applications

- British Dyestuffs Corp., Ltd., Lawrie, Linch, and Rodd. Dyeing cellulose esters etc. 17,847. July 5.
 Durand et Huguenin. Dyeing or printing. 18,067. July 7. (Ger., 10,7,26.)
 Gould, and Gould, Ltd. 18,327. See XV.

VI.—Complete Specifications

- 2143 (1926). Bloxam (I.-G. Farbenind.). See IV.
 9197 (1926). Benckiser, Reimann, Reimann, and Draibach. See V.
 9696 (1926). McCaig and Livingstone. Dye jigs. (273,418.)
 *16,586 (1926). British Celanese, Ltd., Rivat, and Cadgène. Dyeing cellulose derivatives. (273,693.)

VII.—Applications

- Caro and Frank. Production of compounds of nitrogen and oxygen from ammonia. 18,106. July 7. (Ger., 8,7,26.)
 Carreras. Manufacture of bismuth oxides etc. 18,088. July 7.
 Chem. Fabr. vorm. Schering. Manufacture of acetic acid. 18,082. July 7. (Ger., 7,4,27.)
 Coley. Manufacture of cyanides from nitrogen. 18,042. July 7. Manufacture of barium sulphide etc. 18,045. July 7. Reduction of carbonates or bicarbonates. 18,046. July 7. Reduction of sulphates. 18,047. July 7. Manufacture of metallic nitrides etc. 18,050. July 7.
 Johnson (I.-G. Farbenind.). Ammonium phosphates. 17,717. July 4.
 Rosenheim. 17,960. See XXIII.

VII.—Complete Specifications

- 32,489 (1925). Stoees. Extraction of gold from seawater. (273,346.)
 5823 (1926). Finkelstein. Extraction of aluminum ore. (248,746.)
 *7661 (1927). Daloze. Manufacture of lead carbonate. (273,660.)
 *12,772 (1927). I.-G. Farbenind. Production of chromates. (273,666.)
 *17,088 (1927). Leshik. Generation of oxygen from persalts. (273,711.)
 *17,220 (1927). Caro and Frank. Production of high-percent nitric acid. (273,711.)
 *17,442 (1927). Uhde. Synthetically producing ammonia. (273,735.)

VIII.—Applications

- Anderson. Glazing earthenware. 18,286. July 9.
 Russell and Thynne. Pottery etc. ovens. 17,883. July 5.

VIII.—Complete Specifications

- 8009 (1926). Wickham. Decolorising china clay etc. (273,373.)
 14,966 (1927). Quartz & Silico. Manufacture of silica articles with glazed surface. (273,636.)

IX.—Applications

- Cann and Harrap. Cementitious material. 18,102. July 7.
 Dunlevy and Johnson. Manufacture of bricks and tiles. 17,791. July 5.

IX.—Complete Specification

15,517 (1926). British Dyestuffs Corp., Baddiley, Shepherdson, and Davidson. Colouring cement, concrete etc. (273,477.)

X.—Applications

Asheroff. Metallurgy of ores etc. 18,076. July 7.
Birmingham Electric Furnaces, Ltd., and Lobley. Annealing etc. furnaces. 17,912. July 6.

Buess. Rotary melting-furnaces. 17,831. July 5. (Ger., 16.7.26.)

Coley. Manufacture of zinc. 18,041. July 7. Manufacture of alloys. 18,043. July 7. Extraction of gold from arsenical ores. 18,058. July 7. Manufacture of thorium etc. 18,049. July 7.

Jackson (New Jersey Zinc Co.). Condensing zinc vapours. 18,181. July 8. Reducing zinciferous materials. 18,186. 18,189. 18,193. 18,196.

Soc. Ital. di Elettrochimica. Production of aluminium in electric furnaces. 18,215. July 8. (Italy, 8.7.26.)

Verein. Stahlwerke. Manufacture of high-grade cast iron. 18,217. July 8. (Ger., 15.7.26.)

Watkins. Plating metal. 17,824. July 5. (U.S., 24.12.26.)

Williams. Removal of scale from metal. 18,224. July 8.

X.—Complete Specifications

9755 (1926). Corbould. Hydro-metallurgically treating oxide products of lead and zinc. (273,420.)

11,990 (1926). Harris. Refining and separation of metals. (273,440.)

14,083 and 21,781 (1926). Paton and Wood. Metallurgical furnaces. (273,457.)

5823 (1926). Finkelstein. *See* VII.

*20,208 (1926). Western Electric Co., Inc. Magnetic materials. (273,638.)

7591 (1927). General Motors Corp. Electrolytic deposition of chromium. (273,659.)

XI.—Applications

Frigaum Ges. Voltaic cells. 17,809. July 9. (Ger., 14.1.27.)

Pörschke. Galvanic cells. 18,209. July 8.

Soc. Ital. di Elettrochimica. 18,215. *See* X.

XI.—Complete Specifications

12,911 (1926). Darimont. Double-fluid cells. (263,081.)

16,281 -2 (1926). Everett. Storage batteries. (269,120—1.)

*7594 (1927). General Motors Corp. *See* X.

*8942 (1927). Vultex, Ltd. *See* XIV.

*11,458 (1927). United Products Corp. Art of galvanoplasty. (273,664.)

*14,429 (1927). Allen Electrolytic Cell Corp. Electrolytic cells. (273,672.)

*17,592 (1927). Levy. *See* XII.

XII.—Application

Bertsch, and Böhme A.-G. Obtaining sulphonation products from fats etc. 18,188. July 8. (Ger., 8.7.26.)

XII.—Complete Specifications

9197 (1926). Benekiser, Reimann, Reimann, and Draibach. *See* V.

8960 (1927). Industrial Spray-Drying Corp. Manufacture of soap powder. (269,516.)

*26,920 (1926). Mertens. Purifying raw lanolin. (273,642.)

XIII.—Applications

Anderson, Cash, and Stephens. Production of titanium-containing pigments. 17,976. July 6.

British Dyestuffs Corp., Ltd., Strafford, and Walker. Manufacture of phenolic resins. 18,055. July 7.

Carreras. Manufacture of white lead. 18,089. July

XIII.—Complete Specifications

*7661 (1927). Daloze. *See* VII.

*17,549 (1927). British Thomson-Houston Co., Ltd. Resin compositions. (273,748.)

*17,592 (1927). Levy. Manufacture of lacs, varnishes, and enamels for insulating. (273,756.)

XIV.—Complete Specification

*8942 (1927). Vultex, Ltd. Electric deposition of caoutchouc. (273,662.)

XV.—Applications

Gould, and Gould, Ltd. Dyeing leather etc. 18,327. July 9.

Jorgensen. Finishing leather etc. 17,987. July 6.

Simpson. Manufacture of imitation leather etc. 18,243. July 9.

XVI.—Complete Specification

6749 (1927). Boehringer & Soehne. Manure. (268,744.)

XVII.—Complete Specification

15,760 (1926). Nanji. Manufacture of starch. (273,481.)

XVIII.—Complete Specification

24,678 (1926). International Yeast Co. Manufacture of yeast. (259,572.)

XIX.—Applications

Bolton, Read, and Pulvo, Ltd. Preservation of eggs. 17,729. July 4.

Salerni. Manufacture of chocolate. 17,748. July 4.

Verity. Egg preservation. 18,246. July 9.

XX.—Applications

British Celanese, Ltd., Dreyfus, and Haney. Manufacture of aliphatic compounds. 18,098. July 7.

Chem. Fabr. vorm. Schering. 18,082. *See* VII.

Fodor. Preparing acid of phthalic series etc. 17,708. July 4. (Belg., 3.7.26.)

Imray (I.-G. Farbenind.). Manufacture of sulphamic acids of secondary bases. 18,199. July 8.

Johnson (I.-G. Farbenind.). Manufacture of synthetic organic compounds. 18,075. July 7. Production of ointments etc. 18,317. July 9.

XX.—Complete Specifications

181 (1926). Dehn (Lilly & Co.). Treating bacteria, toxins, and serums. (273,349.)

8543 (1926). Macdonald. Manufacture of substances for reducing arterial hypertension. (250,230.)

25,633 (1926). Binz and Rüdth. Production of iodo-pyridine. (259,977.)

*15,992 (1927). Chem. Fabr. vorm. Schering. Manufacture of condensation products from alkylated phenols and ketones. (273,684.)

*15,993 (1927). Chem. Fabr. vorm. Schering. Manufacture of alkylisopropyl-phenols and their hydrogenation products. (273,685.)

*15,994 (1927). Chem. Fabr. vorm. Schering. Manufacture of alkylisopropylene-phenols and alkylated cumaranes. (273,686.)

*17,543 (1927). Soc. Anon. des Distilleries des Deux-Sèvres. Separation of fatty acids from dilute aqueous solutions. (273,744.)

*17,622 (1927). I.-G. Farbenind. *See* I.

*17,708 (1927). Fodor. Preparing an acid of the phthalic series and derivatives. (273,765.)

XXI.—Application

Coley. Manufacture of photographic plates etc. 18,044. July 7.

XXI.—Complete Specification

1551 (1926). Soc. du Film en Couleurs Keller-Dorian. Photographic films. (246,829.)

XXII.—Application

Imperial Chemical Industries, Ltd., and McEntegart. Explosives. 17,761. July 4.

XXIII.—Applications

Hägaras-Billesholms Akt., and Nordiske Natrolith Akt. Softening etc. water. 17,895. July 6. (Sweden, 29.10.26.)
 Marks (Associated Oil Co.). Insecticides. 17,766. July 4.
 Rosenheim. Production of base-exchanging substances. 17,960. July 6. (Ger., 16.10.26.)

XXIII.—Complete Specification

102 (1926). Magrath. Softening water. (273,348.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Stationery, perfumery (20); varnish, paint enamels, (Commercial Bureau, Australia House, Strand, W.C.2, Ref. 469). *Austria*: Smelted aluminium, nickel (29). *Belgium*: Manganese ore (30). *Canada*: Coconut butter (24). *Greece*: Caustic soda (35). *Holland*: Alloy steels (36). *Morocco*: Soya oil (40). *Norway*: Tin in ingots (38). *Portugal*: Tinplate (39). *South Africa*: Red oxide paint in paste (B.X. 3627); leather belting, rubber belting (B.X. 3626); coal elevator, coal chutes (A.X. 4908).

New B.D.C. Dyestuff

The British Dyestuffs Corporation, Ltd., have issued another pattern card illustrating a new addition to their range of acid colours for leather dyeing: Chestnut brown. This colour will interest dressers of chrome, semi-chrome and vegetable-tanned leathers. It is of good solubility, and possesses excellent level dyeing properties, and serves as an excellent basis for the rich brown shades so much in demand for shoe and fancy leathers.

Bisulphide of Carbon (Conveyance) Regulations

The Home Secretary has issued draft Bisulphide of Carbon (Conveyance) Regulations in pursuance of the provisions of the Petroleum Act, 1926. The Regulations define the means and nature of the conveyance, set out the precautions to be observed in filling or emptying, and state the conditions to be observed if electric lighting is used on any tank wagon employed to convey carbon bisulphide.

News from Advertisements

There is a vacant Lectureship in Fuel Technology at the Imperial College of Science and Technology (p. x).

A Coal Research Fellowship at the Imperial College of Science and Technology is offered in connection with Sensible Heat Distillation, Ltd. (p. x).

Students will be interested in the facilities offered at the Imperial College of Science and Technology for study and research in Fuel Technology, (Chemical Engineering and Electro Chemistry (p. x).

An organic chemist requires a post on the commercial or research side of the chemical industry.

Woman B.Sc. (linguist) desires a post in London (p. x).

Chemist requires position, preferably for foods and food preservatives (p. x).

EDITORIAL

Catalysis

WE are glad to publish this week the first half of an important paper on catalysis by Prof. Sabatier, who has done more than anyone else to explain the mechanism of this remarkable and common chemical action and to apply it to industrial purposes. This paper is the second of the Messel Memorial Contributions, and we have every hope that the high standard of the first two members of this series will be maintained so that our readers will continue to derive both profit and pleasure from it. Catalysis is well known to us all, and the word happily expresses an idea which this word only can convey. The word is a mere symbol or idea, a label, not a description. We know perfectly well the meanings of catalysis, of analysis, and of paralysis, and we use these words in connexion with chemistry and medicine; whether our present usage resembles in the least the Greek usage is perfectly immaterial. As a matter of fact, convenient as these words are, the original distinction between them is more apparent than real; in Greek the words *καταλύω*, *ἀναλύω* and *παραλύω* mean practically the same thing: destroy, break up, disband, annul, or end; *καταλύω* has also the additional meaning of rest; an adjournment to an inn is typical of the Greek usage of catalysis. How the word came to be employed in its present sense is not quite clear to us, but it is in many ways an appropriate word. The catalyst is one who rests while others work, who encourages others to work; directors of companies, editors, organisers of all kinds, these are catalysts; some orator at the meeting at Edinburgh called them parasites, but we think this is stretching the Greek language in excess of its tensile strength and going beyond the limits of decorum. What ideas Berzelius had in his mind when he introduced the word catalysis to chemistry we cannot

imagine; perhaps he thought that the difference between breaking up and breaking down is greater in Greek than it is in English. More than a hundred years ago the catalytic action of platinum in promoting the oxidation of hydrocarbons was described both by Sir H. Davy and E. Davy, and it is nearly a hundred years since de la Rive and Marcet suggested that catalysis consisted in a rapidly alternating series of oxidations and reductions. Nearly a hundred years ago Faraday explained the catalytic action of platinum as due to the condensation of gases on the surface of the metal; many chemists of repute in France, Germany, and Great Britain increased our knowledge of catalysis during the middle of the nineteenth century, but it was the work of Sabatier and Senderens which reduced our knowledge to order, gave a rational explanation of the phenomena, and enabled catalysis to be applied to the service of man. That catalytic action has distinguishing properties of its own is perfectly plain; to what extent the chemical action of catalysis differs from any other sort of chemical action, except in degree, is perhaps more a metaphysical than a chemical question. Armstrong told us in his Messel lecture, and on a few previous occasions, and perhaps on one or two subsequent occasions, that chemical action between two pure substances is impossible, and that you must have a third substance to overcome the inertia of monotony; this disturbing element, this *tertium quid*, is a sort of catalyst. Ever since Prof. H. B. Baker, five and twenty years ago, showed how hard it is to make pure dry hydrogen combine with pure dry oxygen, all chemists have realised that pure and dry substances will behave, in several ways and perhaps from several causes, differently from the substances as we usually meet them. The whole of chemistry and of life is stirred into activity by comparatively insignificant

quantities of catalysts, enzymes, vitamins, and so on. We are told that the corrosive action of strong sulphuric acid is due to the mysterious ions, which in extremely dilute solutions play so important a part. What the percentage of ions is, in really strong acids, we have forgotten; even if the percentage is extremely small it may well be that it serves to stimulate the whole. We have for a century been accustomed to use words which come within Lodge's description of "a new name whose full meaning will require further investigation." These new names are being cleared up and defined as chemistry advances; one of them, catalysis, has been pruned and reduced to a reasonable and harmonious conception by the labours of many. To one in particular we offer our thanks not only for his important work, but also for his lucid explanation, we mean Prof. Paul Sabatier.

Fuel Research

The Fuel Research Board continues its work on old problems, and continually attacks new ones; and its reports on processes, its "Technical Papers," and its publications on the physical and chemical survey of the nation's coal resources, form already a considerable aggregate, which is rapidly increasing. Dr. King and Mr. Wilgress have begun experiments on the temperature of initial decomposition of coal (Technical Paper No. 16), which indicate that peat at 180° C. and bituminous coals at 215° to 245° C. slowly give off liquid oils for some considerable time, the temperature needed apparently being higher as the coal contains more oxygen. Along with the appearance of oil there is a rise in the rate of the evolution of water, which seems to indicate the production of water as well as oil through decomposition of the coal substance, and not simply the evolution of moisture originally held in the coal. The paper discusses previous observers' results, and contains a useful bibliographic index. The authors wisely refrain from theorising from their results, and modestly present them as a first instalment.

Mr. Burdakin, in an investigation of the "caking power," so-called, of coal (Phys. and Chem. Survey, No. 8), has done another useful piece of work in a field where much work is yet called for. Following the lead of Badarau and Tideswell, he works out the "caking power curve," by determining the resistance to compression of cokes from each coal mixed with varying amounts to anthracite previously heated to 1000° C. (it is regrettable that he should apply the verb "calcine" to this operation). With nearly all the coals examined, when the heating was rapid (7 min.), a maximum was found for mixtures with considerable proportions of anthracite, and the curves obtained thus differ fundamentally from those of Badarau and Tideswell (who used, of course, not only other coals, but electrode carbon as diluent); and the cokes obtained from some well-known coking coals were greatly swollen and of low strength. But it is the author's merit to have shown that when the rate of heating approached more nearly that in the actual coke-oven (3 to nearly 4 hrs.) the coke from the coal alone was very much stronger, and the strength fell as the proportion of anthracite was increased, the curves so obtained resembling those of

Badarau and Tideswell with a rapid rate of heating. Thus a coal with a high proportion of "agglutinating material," which will bind and coke a considerable proportion of non-coking coal, gives in actual practice a high-class coke, though in the laboratory crucible it may give a highly swollen coke destitute of strength. The details of this careful paper are well worthy of study—the results could only be roughly summarised in the space available here.

The Board has published three or four reports on particular systems of low-temperature carbonisation; and in Technical Paper No. 17 we have an account, by Dr. Lander and Captain Shaw, of the Board's own work in this direction. The paper is chiefly a description of the form of retort (a vertical retort carbonising a charge 7 in. wide at the top and 11 in. at the bottom) which the experience of the past three or four years has shown to be most economical and productive. Work on coals of different coking qualities was very seriously interfered with by the coal strike; but the results of trials of nine different varieties are tabulated in the paper, and reports from some of the 180 purchasers of coke from the retorts show that a very valuable smokeless fuel is thus produced. Presumably these retorts are to be used in the large-scale experiment which the Fuel Research Board and the Gas Light and Coke Co. are to initiate and carry on during the next three years; the results will be awaited with widespread interest.

The methods of analysis of coal contained in No. 7 of the physical and chemical survey pamphlets are those recommended by the Sampling and Analysis of Coal Committee of the Board. An interim report was published in 1923 as No. 2 of these papers, and is superseded by the present issue. It is intended that these methods shall be used consistently in the examination of coals for the National Survey, and the Board expresses the hope that they may be adopted generally by analysts throughout the country. The advantages of having standard methods of analysis for a substance like coal, of no definite composition, and valued for different purposes according to its content of ash or of "volatile matter," its calorific value or its coking power, is unquestionable—the analytical differences which give rise to disputes between buyers and sellers are reduced to a minimum, as far as one fertile cause of them is concerned, if chemists on both sides use the same methods; and the fact that these methods have only been issued after trial upon various coals by all the members of the Committee gives assurance that they are all, if not ideal, at least capable of giving concordant results in the hands of different skilled operators. The danger of standard methods, that they may become stereotyped and be adhered to even when the progress of science has developed better ones, is avoided here by the fact that the Committee is a permanent Committee of the Board, charged with the duty of watching the working of the methods and of revising them as may seem necessary or desirable.

These various evidences of the Board's activity will be welcomed by all those who have an interest, whether scientific, economic, industrial or commercial, in our coal supplies and their advantageous use.

MESSEL MEMORIAL CONTRIBUTION

THE INVERSION OF REACTIONS IN CATALYSIS

By PROF. PAUL SABATIER

1. Catalytic reactions are taking a more and more extended place in modern chemistry, and have become of great importance in the heavy chemical industry. The manufacture of sulphuric acid by the contact process, that of nitric acid by the oxidation of ammonia, that of the last-named body from its elements, the synthetic production of ordinary alcohol starting from acetylene, and more recently that of methyl alcohol, the conversion of oils into fats, etc., all depend upon catalysis and make use of catalysts of many varieties, several metals, oxides, and salts acting sometimes on gaseous systems, sometimes on liquids. The activity of powdered catalysts is generally in direct proportion to the fineness of the particles, and becomes diminished or even totally suppressed by the presence of very small quantities of certain materials which act upon the catalysts just as poisons act on living organisms. Moreover, their activity can be increased by the presence of certain substances which activate them just as numerous drugs supplied to animals in small doses increase, for a certain time, their vital activities.

The number of chemical reactions determined or accelerated by the presence of catalysts is day by day becoming greater. The nature of these reactions is very various, as also is that of the catalyst employed. The name "Catalysis," from the Greek *καταλέω*, "I break down," was introduced by Berzelius rather more than a century ago. Its name seems to imply that it will always convert complex molecules into simpler molecules. Indeed, many examples of catalysis are of this character. The addition of a small quantity of sulphuric acid to a solution of starch completely converts the very complex molecules into the smaller molecules of dextrine, and finally into glucose. A pinch of manganese dioxide thrown into hydrogen peroxide very rapidly brings about its conversion into water and oxygen. After a few moments the liquid contains no trace of the original hydrogen peroxide. But, on the other hand, many examples of catalysis are reactions in which combination or further molecular complication takes place. A few drops of sulphurous anhydride added to ordinary aldehyde cooled to below zero effect a very rapid condensation of it into solid metaldehyde.

If we mix nitromethane and formaldehyde, no reaction is visible in the homogeneous liquid, but we have only to throw in a few crystals of bicarbonate of potassium to see the liquor immediately rise in temperature, and on cooling it yields an abundant crystalline deposit of nitro-trimethylol-methane, a single molecule much more complex than the four molecules which have produced it by their union.*

2. It might be supposed that we could divide catalysts into destructive and constructive catalysts, but this distinction really cannot be made because we find that many bodies can, according to circumstances, change their function, and in turn either remove oxygen or

add it, dehydrogenate or hydrogenate, hydrate or dehydrate.

Thus, platinum-black added to hydrogen peroxide destroys it immediately by the removal of the oxygen, and as the platinum-black remains unaltered it can immediately begin a similar operation again. On the other hand, this same platinum-black in the presence of oxygen, even at the ordinary temperature, will affect the oxidation of alcohol, which is thus converted into aldehyde.

Finely divided nickel obtained by the reduction of its oxide is capable at about 180° of causing the combination of gaseous hydrogen with a considerable number of substances; for instance, it converts aldehyde into alcohol. Finely divided copper obtained in a similar way produces the same effect rather more slowly at a temperature of about 200°. On the other hand, acting at about 250° on the vapour of alcohol, it separates hydrogen from it and yields aldehyde, showing that it can act, according to the conditions, either as a catalyst of hydrogenation or of dehydrogenation. As we have already mentioned, the addition of three parts of sulphuric acid to 100 parts of an aqueous solution of starch maintained at a temperature of about 100°, enables us to effect in 2 hrs. the entire conversion of this starch into glucose. The sulphuric acid acts as a catalyst of hydration. But, on the other hand, pinacone $(\text{C}_2\text{H}_5)_2\text{C}(\text{OH})\cdot\text{C}(\text{OH})(\text{C}_2\text{H}_5)_2$ placed in contact with dilute sulphuric acid loses one molecule of water and is converted into pinacoline; that is, a dehydration accompanied by a migration of the atoms.

These changes in the rôle of the catalysts are shown very well in limited reactions where they facilitate at the same time the two inverse reactions and make it possible rapidly to obtain the limit of the reaction without otherwise modifying the degree of this limit. This is the rôle of platinum-black in the formation of hydriodic acid from the gaseous elements hydrogen and iodine vapour, a formation which is limited by the spontaneous destruction of the hydriodic gas produced. In the presence of platinum-black at 350°, the destruction of this latter substance, as also its formation, is very slow, and it is only after a few days that the limit (about 80% hydriodic acid) will be reached. In contact with platinum-black at the same temperature, the limit is reached in a very short time, the same percentage being formed. In the limited reaction which produces the direct esterification of alcohol by acetic acid, in which the limit at the ordinary temperature is not reached until after ten years, the addition of a small percentage of sulphuric acid enables us to reach the limit in less than 1 hr., because the sulphuric acid can act at the same time as a dehydrating catalyst in the reaction of esterification, and as a hydrating catalyst in the inverse reaction of saponification of the acetic ester.

3. How can we explain these inversions of the part played by catalysts? To bring some clarity to the interpretation of these phenomena, we must recall the accepted theory of the mechanism of catalysis. Although this is certainly complex in its relations with atoms and

* Louis Henry. *Compte Rendus*, 121, 210, 1895.

molecules, and obscurities remain on several points, such as the activation of catalysts due to a secondary catalyst, we must nevertheless admit that in all cases the mechanism of catalysis is associated with a rapid formation from the catalyst and some transformable substance of a temporary unstable compound which, as soon as it is formed, reacts very quickly to form the catalyst again in its primitive form, and is capable of indefinitely reproducing the same effect.*

These temporary compounds which form a step in the reaction will often be very easily detected when the conditions are favourable for their persistence. Thus the direct chlorination of organic compounds by gaseous chlorine is greatly facilitated and regularised if we dissolve a little iodine in the liquid which we wish to chlorinate. The reason is that the iodine, in contact with chlorine, forms at once iodine trichloride which is stable and can be isolated if the liquid which dissolves it is not attacked by chlorine, for instance, carbon tetrachloride. On the other hand, if, for instance, the liquid is benzene, the trichloride immediately attacks it, forming chlorobenzene, and thus it is converted into iodine monochloride, which the chlorine changes again into trichloride, and so on, so long as chlorine is added and the benzene still contains atoms of hydrogen which can be replaced. The true catalyst is therefore the iodine monochloride, the temporary combination is the trichloride.

The mechanism is equally well seen in the catalytic method for the preparation of ordinary acetone starting with acetic acid in presence of calcium carbonate, heated to 500°. If we pass acetic acid vapour over calcium carbonate heated only to about 200° to 300° we get merely the elimination of carbonic anhydride and water vapour, and the formation of acetate of calcium which is stable at these temperatures. But if we work at a temperature of at least 500°, the calcium acetate which is produced is converted at the same time into calcium carbonate and volatile acetone, the fresh acetic vapours regenerate the acetate which decomposes again into acetone and carbonate, and so on indefinitely. It is the calcium acetate, never apparent when we work at 500°, which is thus the temporary compound determining the catalysis.

4. In many cases it is true that the temporary compound which forms the basis of the catalyst cannot be isolated and remains a purely hypothetical substance, but by an inductive reasoning which appears to be perfectly legitimate we are led to admit its existence and to imagine its nature, the phenomena observed being exactly parallel to those in which the temporary compound is visible and capable of isolation.

Finely-divided copper is an excellent catalyst for the direct oxidation of organic vapours; for instance, methyl alcohol. If a current of air or of oxygen is led through a tube containing finely-divided copper, heated to about 250°, we see that it is immediately blackened by the formation of cupric oxide CuO . If we immediately pass over the oxide so produced the vapour of methyl alcohol, it is at once oxidised by the

oxide, and red copper is regenerated with the simultaneous formation of water and formaldehyde. These two operations can be continued indefinitely; the passage of the oxygen which oxidises the metal, then the alcohol which reduces the oxide, is oxidised itself, and we may thus prepare an unlimited quantity of aldehyde. It is more simple to combine these two phases by making a mixture of oxygen and methyl alcohol vapour act upon copper at 250°. The copper is oxidised, and the oxide so formed acts at once upon the alcohol, dehydrogenating it into aldehyde. The reaction becomes a catalysis where the catalyst is the copper, and the temporary compound is cupric oxide, although this is not apparent in a preparation which is well performed.

It is impossible not to compare the catalysis which I have just described with that, still more uniform, which permits of the direct oxidation of alcohols, employing as the catalyst finely-divided silver such as exists in silvered asbestos prepared by reducing by formic acid asbestos impregnated with a solution of nitrate of silver. The resemblance between these two catalysts compels us to believe that, as in the case of copper, there is produced on the surface of the particles of silver a thin deposit of oxide, which is produced very quickly in contact with oxygen, and is easily destroyed by heat, but is capable of reacting very rapidly upon alcohols so as to convert them into aldehydes.

It should be the same with finely-divided platinum employed under its various forms, sponge, black or fine filaments, of which the oxidising activity has been used catalytically for a long period in many important reactions, such as the preparation of nitrogen peroxide starting from ammonia and the preparation of sulphuric anhydride starting from sulphur dioxide.

It is this unstable oxide of silver or of platinum, whatever is its nature, which we cannot yet exactly define, which constitutes the determining cause of the catalysis, in which it takes a part in activating oxygen so as to transform molecular oxygen into atomic oxygen.

5. Allow me to recall some other examples of catalysis. Nickel, prepared by the reduction of its oxide below 700°, is, as I showed more than twenty years ago in conjunction with M. Senderens, a catalyst almost universally applicable in direct hydrogenation, and I have explained its activity by the immediate formation upon the surface of its particles, in the presence of gaseous hydrogen, of an infinitely thin layer of hydride, such as NiH_2 or Ni_2H_3 , or, by the superficial fixation of free atoms of hydrogen endowed with much greater reactivity than that of hydrogen H_2 . We can prove that such reduced nickel absorbs a very important volume of this gas. This volume (about 19 volumes at 20°) is much less than that fixed by platinum black (110 volumes), or by reduced cobalt (153 volumes), and very much less than that fixed by palladium black (850 volumes), which are nevertheless much less powerful hydrogenating catalysts. The actual existence of a definite hydride of nickel produced on the surface of this metal has been recently confirmed by the preparation of solid brown hydrides NiH_2 and NiH_3 , obtained by the

* Paul Sabatier, "La Catalyse en Chimie Organique," 2nd ed., p. 55, Paris, 1920.

direct action of hydrogen upon a colloid solution of the metal; these have very active hydrogenating properties.

6. The primary aliphatic alcohols, when brought in the state of vapour in contact with various anhydrous catalytic oxides (alumina, thoria, blue oxide of tungsten), are easily converted at a temperature of about 350° into ethylenic hydrocarbons and water. I have attributed this to the formation on the surface of these oxides, with the elimination of water, of a thin layer of a kind of ester comparable to ethyl hydrogen sulphate; this, with ordinary alcohol, produces sulphuric acid, and, like it, is converted by heat into an ethylenic hydrocarbon and regenerated oxide.*

So with thoria we obtain successively:—

afterwards:—

The thoria so reproduced can indefinitely produce the same effect if we continue to supply it with the alcohol vapours. We have not been able to isolate by this method the intermediate compound, which is the thoriate or aluminate of alcohol (which we may also consider as an alcoholate of thorium or of aluminium) because the temperature of its formation is no doubt about the same as that of its conversion into hydrocarbon. But such compounds exist and can be prepared. Thus, by the action of aluminium amalgam on ordinary alcohol we can obtain alcoholate of aluminium (or ethyl aluminate) which, in other circumstances, in accordance with our theory, is converted by heat into alumina, ethylene and water. This conception of unstable thoriates or aluminates very quickly formed on the surface of the catalysts by the alcohol vapour enables us to predict reactions which experience verifies with startling precision. These compounds, comparable with esters, should immediately they are produced react like ethyl hydrogen sulphate and yield with ammonia, amines; with sulphuric acid, thiols; with phenols, mixed oxides; with formic acids, the esters of these acids, and I have shown, with M. Mailhe, that this is the true explanation.

7. We think that in all cases of catalysis the reality of temporary compounds should be admitted. In particular, if we consider exothermic reactions taking place with loss of energy like most of the direct oxidations or hydrogenations, we can regard these temporary compounds as intermediate stages in the lowering of the energy of the system. But we can expect also that they can act in both directions—that is to say, by lowering or raising, if the external energy tends to form the temporary compound; by the interaction of the same unstable compounds, the catalysts should act at the same time as catalysts of hydrogenation or of dehydrogenation, catalysts of oxidation or of taking away oxygen, catalysts of hydration or of dehydration. Experience verifies this in many cases, and we can establish certain facts as to the conditions of reversal of their functions. If the reaction we are considering is very exothermic and takes place spontaneously and completely on attaining a particular temperature, the

presence of the catalyst makes the action more rapid, and allows it to take place at lower temperatures. In this case the action will only take place in one direction; the inverse action cannot be realised even with the help of the catalyst unless, perhaps, at very high temperatures, when the dissociation of the molecules becomes important and permits of the reciprocal action of free atoms.

8. In the decomposition of hydrogen peroxide into water and oxygen, which tends to take place completely at all temperatures (below 100°), very slowly in the cold and very quickly at the boiling point, the presence of a little platinum-black is sufficient to set up a rapid decomposition in the cold almost immediately; the action is always complete. No equilibrium is possible in these conditions, the variations of pressure having no definite influence. Finely-divided platinum is here the deoxidation catalyst, and it acts by the very rapid formation on the surface of each particle of a sort of unstable oxide which decomposes very quickly, giving off molecular oxygen, $2\text{H}_2\text{O}_2 + 2\text{Pt} = 2\text{PtO} + 2\text{H}_2\text{O}$, and $2\text{PtO} = 2\text{Pt} + \text{O}_2$, the two reactions being extremely rapid. The first alone is very exothermic, the calorific effect of the second is probably of but little importance. It is to a similar type that the deoxidation catalysts of molten chlorate of potassium and the solutions of alkaline hypochlorites belong. Chlorate of potassium heated alone melts at 350°, and at a slightly higher temperature it decomposes into oxygen and a mixture of perchlorate and chloride. The evolution of oxygen gradually diminishes, and to obtain a complete transformation into chloride of potassium, the temperature must be raised gradually to a dull red heat. On the other hand, if platinum-black is mixed with the chlorate, the latter decomposes without melting at 270°, and the reaction is rapidly completed without the necessity of further heating. Manganese dioxide is an even more active catalyst. With equal weights of dioxide and chlorate the reaction commences at 205° and goes on so quickly that the mass may become red hot and cause an explosion. The intermediate compound is in this case no doubt a peroxide of manganese. Solutions of chloride of lime CaOCl_2 , or of an alkaline hypochlorite such as KOCl , which are normally stable, very rapidly decompose into chloride and gaseous oxygen when certain metallic oxides or the hydrates of iron, manganese, cobalt, etc. are added. It is again the formation of an unstable peroxide which enables us to explain this catalysis, which, like the preceding ones, is complete and is accelerated by a rise of temperature.

(To be continued.)

CALENDAR OF FORTHCOMING EVENTS

- Aug. 20. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, Newcastle-upon-Tyne. Annual Meeting at 2.30 p.m.
- Aug. 31. BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. Annual Meeting (97th year) at Leeds.
- Sept. 9. INSTITUTE OF BREWING, Research Fund Committee and Corporate Members. Visit to hop-growing districts in Kent. Luncheon will be held at Canterbury. (Provisional date.)

* P. Sabatier and A. Mailhe, *Ann. Chim. Phys.* (8), 20, 349; 1910

THE CONVENTION OF CANADIAN CHEMISTS

The tenth annual Convention of Canadian Chemists was held at Quebec from June 6—9. The picturesqueness and beauties of the grand old capital of Canada, containing an architectural blending of old France and modern America, and the historical interest attached to the city, created an ideal place to hold the convention on the Diamond Jubilee of the Dominion.

It was particularly appropriate in that the building wherein the Confederation conference of the thirty-three representatives of the British North American colonies met and formulated the seventy-two resolutions which became the basis of the British North America Act of Confederation stood immediately adjacent to the convention hall of the Laval University. Just as the Confederation pact was accomplished in the ancient capital, the more historically inclined could not refrain from recalling that here was the cradle, not only of old Canada, but also of modern Canada, and that in this city, nearly two centuries ago, the French transferred its future control and conduct to the British. Also, those attending the meeting, at the gateway to the great Dominion, observed that here stands an impressive object lesson to newcomers and visitors, of amity among former foes and different races, in the common monuments erected to the memories of victor and vanquished—Wolfe, Montcalm and the brave men of Levis, Murray—an omen so eminently characterised in the generous courtesy and hospitality unostentatiously extended by "les Quebecois" of the present day.

Probably, the most striking feature of this meeting was the attitude of the Government of Quebec in extending official recognition and support to the Convention. This was only to be expected in view of the great interest taken by Premier Taschereau and his cabinet in the development of chemical and allied sciences and industries.

The opening session was the annual meeting of the Canadian Sections of the Society of Chemical Industry, held in the amphitheatre of Laval University, with an attendance exceeding two hundred. Dr. Alfred E. Macintyre, Chief Explosives Chemist, Ottawa, Chairman of the Canadian Council, presided.

Alex. E. MacRae, B.Sc., Patent Attorney, Ottawa, Secretary of the Council, presented the report for the year. It covered the activities of the Society in Canada and the general position and affairs of the parent

The chairman delivered an address upon "Factory location; with special reference to chemical and allied industries." He reviewed the rise, decline and decay of some former important industries of Canada, and compared the continued progressive development of similar industries abroad. The reason for the decay was attributable, in no small measure, to improper location for continued economic operation. Many of the important factors in evaluation of factory location were considered, such as: sources of raw materials, fuels and power, market for products, transportation facilities, labour, climate and living conditions, taxes and laws, site, etc. The various features in regard to these were discussed, and it was pointed out that no fixed rating could be established for any one of the factors, but that each

must be appraised, per se, in connexion with each individual industry. Examples were given of the influence, on industrial life and success, of errors of judgment in appraisal of certain factors. A number of problems connected with Canadian industry, such as decentralisation, power transportation in various forms, establishment of industries on economic and scientific bases, importance of conservation and proper utilisation of the natural resources, etc., were discussed.

Prof. P. Montpetit, University of Montreal, delivered the centenary address upon "L'Oeuvre de Marcellin Berthelot." Berthelot's activities in organic chemistry and particularly his influence on modern synthetic chemistry received attention, being followed by his pioneering researches on thermo-chemistry and explosives and other branches of the science. His political services to France as Minister of Education and Foreign Minister were discussed, and his contributions to the history of chemistry, in particular to Egyptian alchemy, were considered.

Professors F. B. Kendrick and W. H. Martin, Toronto University, gave an experimental demonstration of the fluorescence of water under the influence of light of short wave-length. Pure distilled water was shown to fluoresce.

The Bakelite Corporation of Canada presented a very interesting industrial film illustrative of the "Story of Bakelite."

A complimentary luncheon was offered to those attending the Convention at the Château Frontenac. Col. John Price, President of Price Brothers Co., Ltd., presided, and his Worship, Dr. V. Martin, Mayor of Quebec, extended a cordial welcome to the ancient capital, felicitously expressing the hope that great results would accrue from the Convention.

Dr. H. Hibbert, Professor, McGill University, delivered a very effective address on the past accomplishments of chemistry, indicating fields of future activities which would be more far-reaching in effect than any previously attained, and invaluable to the future industrial development of Canada. Research and co-operation would bring these to fruition.

At the afternoon technical meeting the chair was occupied by W. A. P. Schorman, Toronto.

S. J. Cook, B.A., Statistician of the Chemical and Mining Division, Bureau of Statistics, Ottawa, read a paper on the "Progress of chemistry in Canada since Confederation." He emphasised the fact that at Confederation (1867) Canada possessed very few chemical and allied industries, and gave statistics showing the present position.

Dr. W. Lash Miller, Professor, Toronto University, and E. M. Sparling gave an account of the progress, during the past year, of further investigation upon Bios II.

A. R. Gordon and F. M. Archibald, Toronto University, contributed an interesting paper upon "The volumes occupied by mixtures of coarse and fine sands."

Prof. Brot., Ecole de Papeterie, Grenoble, gave an address on "The dyeing and uses of artificial silk." The lecturer devoted the greater portion of his attention to acetate silk and the Continental dyestuffs employed for dyeing this material.

The report of the chairman of the committee appointed at the last convention regarding the formation of a

Canadian Chemical Association was received and, after discussion, adopted. A new committee of organisation was appointed.

A large and appreciative audience was present at the public meeting held in the Graduation Hall of Laval University at 8.30 p.m., with Monsignor C. Roy, Rector of the University, presiding. After a beautiful rendering of three "Chants Canadien-Français" by a male choir of Laval students, Dr. E. Blough, Technical Director of the Aluminum Company of America, Pittsburgh, Pa., gave an interesting and instructive address upon aluminium and its development. Commencing with the preparation of metallic aluminium by Wöhler, a century ago, the speaker traced the scientific and economic development of the metal to the discoveries of Héroult and Hall. The early stages of the commercial manufacture and application received adequate attention, followed by a very full description of the modern process of production, which was illustrated by slides. The sources of all the raw materials were indicated and the methods for their utilisation in the industry explained, including the appliances and energy necessary for production. The use of aluminium and its application for many purposes, such as bodies of automobiles, street cars, railway carriages, aeroplanes, etc., were discussed and illustrated on the screen; while the wide application of aluminium for light alloys in the various industries and mechanical appliances was elucidated very fully. The address closed with a number of experimental demonstrations specifically characteristic of the metal.

Prof. J. Watson Bain, Toronto University, presided at the morning session on June 7.

Mr. C. F. Bardorf, Montreal, gave an interesting account of investigations upon "Sugar cane wax."

Dr. G. S. Whitby, Professor, McGill University, discussed the polymerisation of hydrocarbons as applied to the possible synthesis of isoprene and rubber.

S. G. Lipsett, of McGill University, presented the results obtained by Profs. F. M. G. Johnson, G. Maass and himself of an investigation on "the heat of solution and surface energy of solids." The speaker described a new type of adiabatic calorimeter which had been developed to carry out the determinations with a degree of accuracy approaching 0.05%. The results obtained were made by determining the difference in heat of solution of the solid (in this case sodium chloride) in coarse crystalline and finely divided states.

Dr. L. V. Redman, Chairman of the American Section of the Society of Chemical Industry, gave a succinct, yet full, description of the observable properties of "synthetic resins," with an evaluation of the properties required. The various sources of these resins were considered, and the properties of each were discussed in relation to the evaluation factor. Thus, the advantages or disadvantages of the phenol, urea, thio-urea, etc. resins, were presented and their application illustrated.

In his two addresses on "The nature and properties of the carbonyl group," and "Cyclic acetal formation and its bearing on the constitution and properties of the polysaccharides," Dr. Harold Hibbert opened up a wide field in dealing with polymerisation and condensation among a large number of simple aliphatic compounds, with the formation ultimately of cyclic substances;

and in the process features developed which would account for the formation of many intermediate plant substances and ultimately the more complex polysaccharides.

Prof. Brot discussed "rayon" production in France, and cellulose from straw by the action of chlorine. He maintained that the latter method was economically feasible, producing an excellent quality of pulp and paper. The contribution of Prof. T. Thorvaldson, V. A. Vigfusson and C. R. Peaker, University of Saskatchewan, upon "The effect of steam on portland cement mortars and their resistance to sulphate action," indicated that steam under pressure had a beneficial influence on the strength of cement.

Lieut.-Col. the Hon. George E. Amyot presided at the luncheon in the Château Frontenac, and Dr. G. S. Whitby delivered an address on certain aspects of chemical development and the work of M. Berthelot.

Dr. Chas. H. Herty, New York, spoke of the rôle which chemistry should play in the future development of Canada, and touched upon the awakening of certain industrialists in the United States to the benefits arising from research. He particularly called attention to the problem of research in regard to health in the United States, where annually enormous sums were expended in medicine, hospitals, etc., all on account of human diseases.

The annual meeting of the Canadian Institute of Chemistry was held, and the various reports received and adopted. Prof. G. S. Whitby was elected president.

Spencerwood, the official residence of the Lieutenant-Governor of the Province of Quebec, was the scene of the garden party. His Excellency, Hon. N. Perroteau, as host, received and entertained the guests. The beautiful and picturesque grounds, overlooking the St. Lawrence River, Wolfe's Cove, and many points of historic interest, presented an animated picture as the party wandered about to the various vantage points.

Sir Georges Garneau presided at the banquet in the Château Frontenac. After the toast to the health of the King had been duly honoured, the Hon. N. Perroteau, Lieut.-Governor, and the Hon. Alexandre Taschereau, Premier, responded for the Province of Quebec. Abbé Alex. Vachon, Laval University, proposed "The Guests," and Dr. H. M. Tory, Chairman of the National Research Council and Principal of the University of Alberta, Dr. A. E. Macintyre, Dr. Lash Miller, Dr. G. Baril, Dr. Chas. H. Herty, Prof. Brot, and Dr. H. Houlston Morgan, London, Eng., replied on behalf of the associations which they represented.

A very interesting session was held on June 8, with Dr. Harold Hibbert presiding.

Mr. E. Price, of the Canadian Celanese, Ltd., Drummondville, Que., gave an interesting account of "Celanese" and its properties.

Prof. J. Watson Bain gave a preliminary account of the fractionation of the "lignosulphonic acids" obtained from sulphite pulp liquors, indicating that the so-called lignosulphonic acid is a very complex mixture of a considerable number of organic compounds with varying composition, particularly in relation to the sulphur content. The investigation is being continued.

The address of L. R. Thompson, Professor of Technology, McGill University, upon recent developments in fuel technology, was an excellent summary of the various methods of carbonisation, with the present status established, and the more probable commercial processes which are the subject of experimental investigation.

Mr. A. E. Plumbeck, Montreal, gave a résumé of the position of the nitrocellulose lacquers and their uses.

A number of chemists were the guests at the Rotary Club luncheon in the Château Frontenac. Dr. C. H. Herry gave an address dealing with the importance of chemistry to industrial development and public health.

The afternoon was devoted to an auto-car excursion to the Battlefields Park, Montmorency Falls (100 ft. higher than Niagara), with its power development, Ste. Anne de Beaupré (the Lourdes of America), and the new paper mill at Beaupré. The visiting chemists had an evening sail upon the St. Lawrence, extending from the Island of Orleans to the Quebec Bridge, at Cap Rouge, thus covering the course over which Wolfe's boats drifted on the eventful night preceding the capture of Quebec. The new harbour works being constructed between Cape Diamond and Sillery and other points of interest were viewed.

The Associated Committee of Chemists of the National Research Council met on June 9, with Prof. R. E. Rattan in the chair. Dr. H. M. Tory gave a full review of the activities of the various branches, and a number of interesting problems and topics were considered and discussed.

In the evening a public meeting was held in the Graduation Hall of Laval University, when Prof. Brot addressed a large audience upon "Cellulose from wood and the nitrocelluloses."

Excursions were made, by parties, to Shawinigan, Arvida, Ile Maligne and Kinogami.

THE ALKYL RESORCINOLS CASE

Mr. Justice Astbury, in the Chancery Division on July 19 concluded the hearing of an action by Sharp and Dolme, Inc., of Baltimore, U.S.A., against Boots Pure Drug Co., Ltd., Nottingham, claiming an injunction to restrain an alleged infringement of a patent (212,922 of 1923), owned by the plaintiff company for improvements in or relating to the manufacture of alkyl resorcinols.

The plaintiffs said the inventions to which the patent related were new substances prepared and produced by chemical processes and intended for medicine. They alleged that the defendants had manufactured substances of the same chemical composition and constitution as the new substances, and had thus infringed the patent. They complained of an advertisement of the defendants and of the sale of "Hexyl Resorcinal Boots," which they said was one of the new alkyl resorcinols. Defendants said the invention claimed was not novel by reason of prior publication and prior common knowledge.

Sir Arthur Colefax, K.C., and Mr. Stafford Cripps, K.C., appeared for the plaintiffs, and Mr. Whitehead, K.C., and Mr. K. Swann for the defendants.

Sir A. Colefax said the attack on this chemical patent

would be found to centre on an alleged want of subject matter. He could not remember a case in which the field of chemistry to be covered was so wide as in this case. The invention related to the production of new alkyl resorcinols which never existed before the date of the plaintiffs' specification, and they were concerned with bodies containing more than two carbon atoms in the alkyl group. He contended that the earlier documents would not avail the defendants, and although there was a paper by Johnson and Lane (J. Amer. Chem. Soc., 1921, 348-360; relating to the preparation of *n*-butyl resorcinol), he would cite Sir James Dewar's dictum that there was no provision in chemistry: there was no such thing as a general reaction in chemistry. The fact that these authors had purported to make discoveries in relation to the lower alkyl resorcinols did not justify any chemist in saying that the same methods would serve for the preparation of the higher alkyl resorcinols, or that these bodies, when prepared, would have analogous or even enhanced disinfectant properties.

His Lordship asked "Are the defendants going to say that the alkyl resorcinols, having previously been made on a general formula, the method of preparing this resorcinol body that the plaintiffs are claiming is not subject matter, because having got an alkyl resorcinol on the general formula with more than two carbon atoms, it is not invention to make it from a different base?"

Mr. Whitehead said that was one of the things they were going to say.

Mr. Horatio Ballantyne, giving evidence for the plaintiffs, stated he found nothing in the documents cited that bore on the plaintiffs' specification. Questioned in detail by Mr. Whitehead as to whether chemists recognised the applicability of generally-applicable reactions in homologous series, Mr. Ballantyne replied to the effect that chemists did not recognise any reaction as generally applicable.

Sir William Pope gave evidence in favour of the novelty of the patent.

Mr. Whitehead, in opening the case for the defence, submitted that the alleged invention as claimed in the plaintiffs' specification had been wholly anticipated. As he understood it, the invention related to a method of manufacturing alkyl resorcinols, and he did not allege that the process would not be effective for producing any alkyl resorcinol. It was part of his case that it was effective for that purpose, and that that was obvious to all chemists. Sir William Pope's evidence was designed to show that so-called general reactions broke down, but it proved that a chemist would try them with a reasonable expectation of success, even if they were not applied to homologues of the bodies with which they succeeded. It was much more likely that reactions which had proved successful for the production of the lower alkyl resorcinols should succeed with the higher homologues. He submitted that the new product could not be claimed apart from the process, and the mere novelty of the product in itself was not good enough.

In cross-examination, Dr. O. Oberlander said he considered that the mere preparation of hitherto unprepared homologues did not involve research. Prof. T.

Gray agreed as to various so-called general reactions which failed, but observed that chemists were expected to use their scientific intelligence. Reactions which applied to certain members of an homologous series did not break down suddenly, but slowed down or showed a greater tendency to begin secondary reactions. Dr. J. Marshall, research chemist to Messrs. Boots, described how he was led, from inspection of the literature, to prepare hexyl resorcinol, which was produced on the manufacturing scale within six weeks.

His Lordship, giving judgment, reviewed at great length the papers relied on as showing prior publication, and said there was no inventive step in the plaintiffs' patent at all having regard to what had been published in those documents. In his opinion the prior documents on their true construction made it impossible for a chemist subsequently to acquire a valid patent for continuing the published work of those who had gone before them on their lines, following out their directions with the bodies indicated by them for the purpose of producing the results which they had been told to expect by so doing. This would be too great a reward for merely verifying the work of others, and proving their general statements and conclusions to have been well-founded, and would, if countenanced, be a serious blow to chemical industry. The action would be dismissed, with costs.

NON-FERROUS METALS IN CANADA, 1926

Finally revised statistics on the production of various non-ferrous metals in Canada during 1926 are reported by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics as follows:—

Mercury.—According to the Provincial Mineralogist of British Columbia some work was carried on at a cinnabar property at Copper Creek near the north shore of Kamloops lake during 1926, and 5 flasks of quicksilver were obtained by retorting the ore obtained.

Molybdenum. Production in 1926 amounted to 25,168 lb. of molybdenum concentrates containing 20,943 lb. of molybdenum sulphide valued at \$10,472, as against 30,764 lb. of molybdenum concentrates containing 22,350 lb. of molybdenum sulphide valued at \$11,176 in 1925.

Tin. Small amounts of tin are contained in the ores of the Sullivan mine of British Columbia, but it has not been recovered commercially up to the present time.

Cobalt.—Finally revised statistics show an output for 1926 of 664,778 lb. of cobalt valued at \$1,136,014, as against 1,116,492 lb. (\$2,328,517) in 1925. This production figure includes the cobalt content of the various cobalt products sold by the south Ontario smelters and the cobalt content of the ores and residues exported for treatment in foreign smelters; the value given is the net amount received by the shippers.

The decline in production was caused by the introduction into the world's markets of cobalt from central Africa, where it occurs in association with copper in the mines operated by the Union Minière du Haut Katanga. This company now produces about 45% of the world's output, and the Canadian production makes up the remaining 55%.

No production of chromite or manganese was reported for 1926.

CORRESPONDENCE

PROCEEDINGS OF THE COAL CLEANING CONFERENCE

SIR,—The Proceedings of the Coal Cleaning Conference, held under the auspices of the Joint Committee of the Institution of Gas Engineers, the Coke Oven Managers' Association, the Fuel Section of the Society of Chemical Industry, and attended by a number of mining engineers, are being published as a separate volume, including a verbatim report of the discussion.

This procedure has been arranged as a result of suggestions received from many quarters, and the whole will be published in a paper cover at a cost of 2s. 6d. post free. Copies can be obtained from the

General Secretary,
Society of Chemical Industry,
Central House, Finsbury Square,
London, E.C. 2.

As only a limited number of copies are being published, we should be glad to learn whether you would like us to reserve any for your members.

Yours truly,

(Signed) E. W. SMITH.

Hon. Secretary,

Fuel Section of the Society
of Chemical Industry
Central House,
Finsbury Square,
London, E.C.2.

THE REFINING OF MINERAL OILS

SIR.—The views expressed by Mr. Lee in your issue of July 22, concerning the changes which mineral oils undergo during the sulphuric acid refining process appear to receive some support from recorded facts relating to the oxidation of insulating oils.

The official adoption of the "sludge value" test for these oils has led to drastic refining whereby colourless oils are obtained which have practically zero iodine values and do not produce "sludge" upon oxidation. Such oils are, however, by no means stable, and their oxidation results in the formation of water and acids having a marked odour.

It has been suggested that the resin-like substances present in the partially refined oils, while being responsible for the formation of "sludge," afford protection to the hydrocarbons, and that thorough refining leaves the latter unprotected. Mr. Lee's suggestion that refining brings about a change from cyclic compounds to *iso*-paraffins seems to offer a more reasonable explanation of the phenomenon, as the liability of poorly refined oils to give rise to asphaltic substances may be ascribed to the presence of complex cyclic compounds (particularly those containing double bonds) and the instability of the "non-sludging" oils is more easily understood if, as Mr. Lee suggests, they contain *iso*-paraffins.

I am, Sir, etc.,

CECIL O. HARVEY

PERSONAL AND OTHER ITEMS

Sir Alfred Mond has been elected President of the Chemical and Allied Employers' Federation. Sir Alfred and Lady Mond are now on the Continent, where they will remain for about a month.

Lord Colwyn has been elected to the board of Imperial Chemical Industries, Ltd.

On July 20 Mr. S. A. Courtauld laid the foundation stone of the Institute of Biochemistry at the Middlesex Hospital, for the provision of which he has given £40,000. The professor of biochemistry in the new institute is Dr. E. C. Dodds.

Dr. J. Gordon Parker, principal of the Leathersellers' Technical College, has resigned from his post. Dr. Parker, who was one of the founders of the International Association of Leather Chemists, has been associated with the Leathersellers' Company for 31 years.

The following appointments in the University of Manchester have been made: Lecturer in electrometallurgy, Mr. E. O. Jones, B.Sc., assistant lecturer in chemistry, Mr. W. S. McGinness, B.A.

Dr. W. H. Linnell has been appointed University Reader in pharmaceutical chemistry in the London University.

The degree of D.Sc. in chemistry of the University of London has been conferred upon Messrs. P. B. Ganguli, E. S. Hedges and S. J. Lewis.

A Senior Studentship for 1927 has been awarded by the Royal Commissioners for the Exhibition of 1851 to Mr. R. Hill, for research in biochemistry.

The Priestley Scholarships in chemistry, at the Birmingham University, were won this year by Harold G. Bott, Horace A. Hampton, and Robert S. Tipson.

Dr. G. W. Thompson, chief chemist of the National Lead Company, delivered the graduation address at the Armour Institute commencement exercises in Chicago, on Thursday, June 9, and received the honorary degree of D.Sc. Dr. Thompson was born in 1865, and has been chief chemist and a director of the National Lead Company since 1892. He is also a director and vice-president of the Wm. Harvey Co., director of the Titanium Pigment Co., director and vice-president of the United Lead Co., director and treasurer of the Metallurgical and Chemical Corp., a member of the Society of Chemical Industry, the American Chemical Society and other scientific bodies, and a past president of the American Society of Chemical Engineers.

Beit Fellowships at the Imperial College of Science and Technology have been awarded to: Mr. I. Vogel, M.Sc., who will continue his studies on ring formation, and to Mr. K. V. Themann, who will investigate the effect of electrical currents on proteins. An extension for a second year has been granted to the Beit Fellowship held by Mr. J. Topping for research on the mechanical equilibrium of crystal lattices, and to that held by Mr. J. W. Maccoll for studies in the motion of viscous fluids.

We record with regret the death of Mr. W. G. Richards, Grad.I.Chem.E., who since 1919 had been resident in Brazil. He had carried out much research work in connexion with ore-dressing and concentration, and had just secured an important new appointment when he succumbed to typhoid fever shortly before his 27th birthday.

The death is announced of Hans Blücher, the author of the well-known "Auskunftsbuch für die Chemische Industrie," now in its 12th edition, and several other technical books. Herr Blücher, who had been a member of the editorial staff of the *Chemiker-Zeitung*, had specialised in plastic materials, and was the discoverer, with E. Krause, of "ernolith," a plastic material made from yeast.

Prof. V. Lenher, of the University of Wisconsin, has died, aged 54. He had carried out important work on selenium and tellurium, and was the first to note the unusual solvent properties of selenium oxychloride.

The late Prof. E. H. Starling, Foulerton Research Professor of the Royal Society, left £14,310.

The late Mr. A. B. Reckitt, joint managing director of Reckitt & Sons, Ltd., starch and blue manufacturers, left £548,516.

Sir Alfred Mond on the Future of Industry

In an interview published in the *Evening Standard* of July 25, Sir Alfred Mond made some interesting comments on the future of British industry and the great power of the Empire as an economic unit. After reaffirming his conviction that the future of British industry is bound up with the progress of chemical and scientific research, Sir Alfred Mond said Great Britain must become independent as far as possible of imported raw materials. Through the high-pressure nitrogen industry, they could see the lines along which that could be done. Production at Billingham was on a large scale, and would be enlarged. They were carrying out tests of a new system of rotational grazing of grass treated with combined nitrogen at 80 farms, and he believed that during the next five years, as a result of chemical research, a new era would have dawned for British agriculture. Within the next five years we should be making large quantities of oil from coal by the I.-G. process, and there would be great developments towards the production of synthetic alcohol and vitamins. The co-operation of labour in industry was essential, and they were now formulating a labour policy for Imperial Chemical Industries, Ltd., based upon the principles of profit-sharing, works councils, welfare schemes, workers' shares, and co-operation in every possible direction.

Fuel Conference, 1928

The technical programme for the Fuel Conference to be held at the Imperial Institute, South Kensington, from September 24 to October 6, 1928, has now been issued. Lord Balfour has accepted the Hon. Presidentship and Sir Alfred Mond the Presidentship of the Fuel Conference, and the chief participating industries, namely, coal, oil, gas and chemicals, are strongly represented on the Fuel Conference Committee and the Technical Committee. Dr. H. Levinstein represents the Society of Chemical Industry, and Dr. E. W. Smith is a joint technical secretary to the Conference. Representatives of additional interested organisations will be added to the Fuel Conference Committee later. The member countries of the World Power Conference are arranging to participate in the Fuel Conference to the fullest possible extent by the presentation of papers under the various headings of the Technical Programme and by the attendance of

fully representative delegations. In order to shorten the proceedings and to focus the attention of the Conference on the most important aspects of the subjects to be covered, apart from exceptional cases, only authoritative reports from representative bodies in each participating country will be accepted.

Further announcements regarding the Conference will be published later.

Chemical Society's Library

The Library of the Chemical Society will be closed for stocktaking from Monday, August 1, until Saturday, August 13 inclusive, and will close each evening at 5 o'clock from August 15 to September 10.

Statistics

Perhaps one of the most striking of post-war developments has been the increasing recognition of the importance of statistics in all branches of activity in the organisation and management of commercial and industrial enterprises, as well as in the investigation of social and economic problems. Government publications are the most important of all sources of statistics in the United Kingdom from the point of view both of their scope and of their authority. The complaint used to be, however, that this valuable material was unknown and inaccessible except to the few who had specialised in the study of official publications. The introduction of the annual Guide to Current Official Statistics, the 1926 volume of which has just been issued by the Permanent Consultative Committee on Official Statistics (H.M. Stationery Office, pp. 273. Price 1s. net, post free 1s. 4d), has removed all difficulties that may in the past have stood in the way of those who wished to avail themselves of this indispensable source of information. The Guide is much more than a mere catalogue of publications. Its central feature is an index on novel lines, which not only directs the enquirer to those volumes which contain statistics bearing on his subject, but also indicates their scope and degree of detail. To trace all the statistics on the varied subjects dealt with in Government publications is a matter of a few minutes with the aid of the Guide, which should prove a handy work of reference for the business man, writer, librarian, student of public or social matters, and professional worker.

Chemistry as a Career

A "Careers" pamphlet issued by the Faculty of Science of the University of Birmingham states that "on the whole" the tendency at present is to divert those students who have put their names down for chemistry and physics towards other branches of science, chemistry in particular being in danger of becoming a congested subject, unable to provide a living for all men who are being trained in it. Only the very best, it is pointed out, may feel sure of obtaining a place after graduating; both industrially and commercially the market for chemists would seem to be overstocked.

The Title "Chemist"

According to the "Journal" of the Institute of Chemistry, the Legislative Council of the Zanzibar Protectorate has passed a decree to regulate the dispensing and sale of drugs and poisons, in which only the word "druggist" is used to define a person who mixes, compounds, prepares, dispenses or sells any

drug or poison. By motion of the Director of Agriculture, Mr. V. H. Kirkham, who is Hon. Corresponding Secretary to the Institute, the word "chemist" was deleted from the decree.

Dinitrophenol and the Explosives Act

By Order in Council, dated June 27, dinitrophenol is declared to be an explosive within the meaning of the Explosives Act, 1875, unless it contains water in the proportion of not less than 15 parts by weight to 85 parts of dinitrophenol, or, if less water is present, the substance is packed, in quantities not exceeding 5 lb., in sealed packages in the construction of which, except for nails or similar parts, no metal other than aluminium or a 90% alloy of it is used. Dinitrophenolates and mixtures of dinitrophenol with other substances are also regarded as explosives unless (a) a dinitrophenolate is mixed with not less than half its weight of water and is kept or conveyed in watertight packages, and (b) dinitrophenol is mixed with not less than three times its weight of anhydrous sodium sulphate, crystallised sodium sulphate, or potash alum.

National Research Laboratories for Canada

The Canadian Government has decided to establish National Research Laboratories at Ottawa under control of the Honorary Advisory Council for Scientific and Industrial Research. The functions of the Laboratories are to comprise standardisation work, similar to that carried out by the National Physical Laboratory in England, and research for private companies, who would pay for the facilities offered.

Empire Mining and Metallurgical Congress

In connexion with the Empire Mining and Metallurgical Congress which meets in Canada in August, the Federal Department of Mines, Ottawa, is kindly offering its services to members who wish to obtain information about mining districts in which they are interested and which they will visit on the tours that will be made after the session at Montreal. For those attending the Congress the Department is preparing a handbook entitled "Canada—Geology, Mines and Metallurgical Industries." Intending delegates from this country can obtain information regarding the mineral industry of Canada from the Natural Resources and Industrial Information Branch of the Office of the High Commissioner for Canada, The Canadian Building, Trafalgar Square, London, S.W.1.

Nickel in Canada in 1926

Finally revised statistics on nickel production in Canada during 1926 as reported by the Mining, Metallurgical and Chemical Branch of the Dominion Bureau of Statistics show an output of 65,714,294 lb. valued at \$14,374,163, compared with 73,857,114 lb. (\$15,946,672) in 1925. These figures include the nickel in matte exported by the Mond Nickel Co., Ltd., and the International Nickel Co. of Canada, Ltd., at 18 cents per lb.; refined and electrolytic nickel produced at Port Colborne at the value obtained for such products sold during the year; nickel in nickel oxide and nickel salts sold from south Ontario smelters and from Port Colborne at its total selling value as oxide or salts; nickel metal sold from south Ontario smelters; and nickel contained in speiss residues exported, valued at 18 cents per lb. The greater part of Canada's nickel is produced by the Inter-

national Nickel Co., and the Mond Nickel Co. Smaller amounts are also recovered by the Deloro Smelting & Refining Co., Deloro, Ontario, from the silver-cobalt-nickel ores of the Cobalt district.

The Explosibility of Lead Bromate

A serious explosion, which caused two deaths and considerable material damage, took place some time ago in Germany in an industrial laboratory during the preparation of about 1 kg. of lead bromate from solutions of potassium bromate and lead acetate. The difficultly soluble lead bromate had been separated and dried, and was being ground up for further purification, when the explosion occurred. Inquiry showed that pure lead bromate would not detonate, except when, as in the present instance, it contained an oxidisable organic substance such as acetic acid. The compound which caused the explosion was found to be diplumbo-diaceto bromate.

Vitamin E in Cod-liver Oil

In the course of some recent work on the food-value of cod-liver oil, as tested by the biological method (*Ind & Eng. Chem.*, July, 1927), Nelson, Jones, Adams and Anderegg have shown that a synthetic diet containing casein, salts, yeast, dextrin, and cod-liver oil as the sole source of fat-soluble vitamins suffices for normal growth and reproduction. The results obtained with cod-liver oil depended upon the manner in which the oil was fed. More favourable results were obtained when the oil was mixed in the ration daily, than when mixed in kilogram quantities of the ration.

Synthetic Fuel in France

A company has been formed, the Cie. des Carburants Makhonine, with a capital of 12 million fr., to exploit the Makhonine patents for the transformation of heavy fuels, tars, coals and the like into motor fuels.

Chemical Industry in France

The directors of the Société Chimique des Usines du Rhône and of the Établissements Poulenc Frères have accepted a scheme for the amalgamation of the two companies.

The capital of the Société l'Ammoniaque Synthétique Procédés G. Claude is to be increased from 20 to 45 million francs.

At present France is producing 100,000 tons of synthetic ammonium sulphate annually, according to M. C. Moureau, president of the "Commission de Défense Nationale pour les Industries Chimiques." To this total should be added 50,000 t. yearly from the cyanide factories and 50 t. a day from the State plant at Toulouse. In a year, it is estimated, France will be producing an output of fixed nitrogen, including synthetic and by-product material, equivalent to 500,000 t. of ammonium sulphate a year, of which the State plant will contribute 150,000 t.

Committee of French Chemical Industries

The chemical companies which recently formed the Committee of Chemical Industries for France, represent a total capital of 857,500,000 francs. The capital (in million francs) of the participating companies is:—Alais, Froges et Camargue, 208; Établissements Kuhlmann, 190; St. Gobain, 161; Electro-Chimie d'Ugine,

80; L'Air Liquide, 60; Bozel-Malettra, 52.5; Grande Paroisse, 50; Usines du Rhône, 27; Coignet, 12; Société Ammonia, 12; and Comptoir des Textiles Artificiels, 5.

The Work of the Government Laboratory, Siam

From the Third Report of the Government Laboratory (Ministry of Commerce and Communications, Bangkok, Siam), for the year ending March 31, 1926, we learn that during the period reviewed, 1025 analyses of a general nature and 1601 assays of silver for the mint were carried out. The investigation of materials submitted by the Botanical Section, with a view to their commercial utilisation, forms also an important section of the Laboratory's work. The erection and equipment of an additional building for work on a semi-technical scale, on investigations of vegetable products, was completed in April, 1925. Provision has also been made in the equipment for the preparation on the large scale of ethyl esters of hydnocarpus oil and vitamin extract, for the treatment of leprosy and beri-beri respectively. The report gives details of the building and of the equipment (which had been selected by Dr. R. Lessing, of London). The demand for hydnocarpus preparations continued to rise, and 107.3 litres were prepared from the oil of *Hydnocarpus anthelmintica*, which occurs in abundance in Siam. It was found that treatment gave an improvement in 71.1% of the cases, and a marked improvement in 22.7% of the total cases (357 patients). Analytical data for the oil of *Hydnocarpus anthelmintica* and its mixed ethyl esters are given in the report.

From work done on the chemistry of opium smoking, it appears that the physiological effects of opium smoking must be largely due to volatile decomposition products of the constituents of prepared opium. Opium smoke only contains traces of alkaloids; the smoke from 5 g. opium yielded 5 mg. of crude morphine and 5 mg. of crude alkaloids other than morphine. Taking 1.25 g. of opium as a normal smoke, this would yield only 0.0025 g. total crude alkaloids in the smoke. A study of the subject should take into account the processes which raw opium undergoes before entering the pipe.

During the period under review 41 articles were examined by the Laboratory, and 17 (41%) were found to contain poisonous principles, varying from arsenic, strychnine, atropine, and mercury to glucosides. The chemico-legal work of the Laboratory also included the examination of stains for human blood. Many (118) drugs were examined for prohibited or restricted alkaloids.

Two hundred and eight samples were received from firms and private individuals for analysis, for which the fees collected were 2316 ticals. The fees received for preparations, chiefly hydnocarpus esters, amounted to 401.75 ticals. A consignment of seeds of *Combretum quadrangulare* (Sakê), collected by the Botanical Section, were sent to the Wellcome Research Laboratories, London, who have undertaken its investigation with a view to its use as an anthelmintic. The report also includes analyses of materials of general interest, such as the fruit of *Dipterocarpus obtusifolius* and seeds of *Strychnos roborans*.

REVIEWS

A SYSTEMATIC QUALITATIVE CHEMICAL ANALYSIS.—A THEORETICAL AND PRACTICAL STUDY OF ANALYTICAL REACTIONS OF THE MORE COMMON IONS OF INORGANIC SUBSTANCES. By GEO. W. SEARS, Ph.D. Second edition, revised. Pp. x + 165. New York: John Wiley & Sons, Inc.; London: Chapman and Hall, Ltd., 1926. Price 10s.

This book consists of four parts with an Appendix and Index. Part I consists of Theoretical Introduction and Laboratory Suggestions; Part II contains the reactions of the metallic ions; Part III those of the acidic ions, and Part IV the Systematic Analysis with Tables of Separation. In each part there are suggestive questions, and discussions of the reactions, which are valuable. The methods of analysis follow the usual lines with a few exceptions. Bismuth and antimony are provided for in Group I in case they are precipitated as oxychlorides. This may occur when ammonium chloride is used as the group reagent, but with dilute hydrochloric acid, which may be used in excess, these precipitates will not remain permanently, and it is a pity to complicate Group I with their presence. Group III is divided into aluminum and iron divisions, the aluminium division containing aluminium, chromium and zinc, whose hydroxides are soluble in sodium hydroxide together with peroxide. That the separation is not very satisfactory in the case of zinc, which may appear in the iron precipitate is, however, recognised by the author. If phosphate is present, the phosphates of the alkaline earth metals and magnesium may be precipitated with iron, and the usual method for their detection, after this precipitation, is adopted; but it is better to regard the phosphate radicle as a disturber of the normal course of analysis, and to eliminate it in acetic acid solution, so that alkaline-earth and other metals which would otherwise form insoluble phosphates, may remain to be precipitated in their proper place, and need not be looked for twice over.

The book calls for no other comment. It is scientific and systematic, as it claims to be; also it is excellently printed. There is no doubt, therefore, that many will find it a valuable guide to qualitative analysis.

R. M. CAVEN

COURS DE CHIMIE INORGANIQUE. By Prof. F. SWARTS. Fourth edition, revised and enlarged. Pp. 786. Bruxelles: Maurice Lamertin; Paris: Librairie Scientifique J. Hermann, 1926. Price 72 frs. Belges.

This is a comprehensive work, including fundamental chemical theory and physical chemistry, interspersed with descriptions of the elements and their principal compounds, as well as of the chief manufacturing processes given in brief outline. The physical chemistry includes osmotic pressure, theory of ionisation, phase rule, constitution of alloys, colloids, thermochemistry, thermodynamics and Nernst's heat theorem, electrochemistry, radioactivity, and the constitution of the atom.

The treatment is on orthodox lines, and the conventional graphic formulæ are used. For example, sulphuric acid is represented as $\text{SO}_2(\text{OH})_2$ (p. 264), although in

connexion with an account of Werner's theory (p. 752) it is admitted that the four oxygen atoms in the sulphate ion may be regarded as similarly related to the sulphur atom. Also the fluosilicate ion is represented (p. 421) thus:

although it is stated (p. 719) that, according to the work of Bragg, the six atoms of fluorine in this ion occupy the angular points of a regular octahedron, with the silicon atom in the centre.

Valency and atomicity are with this author equivalent terms (p. 67); celtium is preferred to hafnium (pp. 24 and 502); heats of formation are tabulated at the ends of some of the chapters. An interesting and rather unusual division of the *semi-metals* (*métalloïdes*) is into the following families: "halogenes, sulfurides, azotides, carbonides, argonides."

The book is well printed; but it is a pity that the proof-reading was not more carefully done, so that the very long list of errata printed on a separate sheet could have been avoided.

Considering the entire book, one may express astonishment that so much information is contained in a single volume of moderate size. Undoubtedly the work justifies its title, for it gives an adequate account of inorganic chemistry on its descriptive side, and combines with this sufficient physical chemistry to round off the whole, and make it scientific in the best sense.

R. M. CAVEN

A TEXT-BOOK OF PHARMACY. By A. O. BENTLEY, Ph.C. With a section on Some Biological Aspects of Pharmacy. By Dr. H. S. HOLDEN. Pp. x + 540. London: Baillière, Tindall and Cox, 1926. Price 15s.

This book is intended for pharmaceutical students, and treats of the processes used for the manufacture of medicinal preparations, dealing principally with the drugs of the British Pharmacopœia. It is divided into three parts, the first of which deals with the drying and comminution of crude drugs, processes of precipitation, crystallisation, evaporation, distillation and sublimation, and the manufacture of extracts, decoctions, infusions, tinctures, and so on. Illustrations of modern apparatus, as used in the manufacturing laboratory, are included.

Part II deals with the preparations of the Pharmacopœia divided into sections, such as confections, pills, effervescent preparations, spirits, solutions, acids, mucilages, liniments, lotions, ointments, plasters, suppositories, infusions, extracts, tinctures, and wines. Explanatory notes on the official directions indicate the chemical reactions involved and the reasons for the *modus operandi*. The names of the ingredients for each official preparation are given, but the proportions are omitted. The alkaloidal assay processes are given in detail, and biochemical tests recently adopted by the Pharmacological Laboratories of the Pharmaceutical Society are also referred to. A useful feature consists of a set of practical exercises at the end of each section for students in practical pharmacy.

The last section, entitled "Some biological aspects of pharmacy," by Dr. Holden, is a new departure in a text-book of pharmacy. This deals with the preparation of vaccines and sera, sterilisation, and the preparation of surgical dressings, concluding with a chapter on enzymes. Tables of strengths, doses, and solubilities are given in an appendix.

This book well fulfils the requirements of pharmaceutical students, and should prove of great assistance to teachers of pharmacy, being of a somewhat different type from that of previously published works on the subject. It is based on the Pharmacopœia of 1914, and will require revision when a new edition (now overdue) is published. The general principles are clearly outlined and concise, and the volume should have a good reception.

(C. T. BENNETT)

LES IONS D'HYDROGÈNE. By W. KOPACZEWSKI. Pp. x + 322. Paris: Gauthier-Villars et Cie., 1926. Price 40 fr.

The aim of this book is stated to be "practical, critical, and didactic." The didactic part forms the main text in large print: details of experimental manipulation, historical notes, and criticisms of theory and some experimental methods are given in small print. Some of the information is, strictly speaking, irrelevant in a "didactic" text-book written for experimenters; e.g., the diagrams of the structure of some atoms (in which circular orbits only are shown), the estimated radii of the ions Li^+ , Rb^+ , I^- , &c., and the solution pressures of some metals. On account of these and other reasons the book has largely the character of a critical monograph.

The first two chapters, on "Electrolytic equilibria," follow the usual lines, but are rather narrow in scope. Thus there is no adequate account of amphoteric electrolytes or of dibasic acids. Here and there some curious statements are found, e.g., that $\text{N}/_{10} \text{NaCl}$ is 1% hydrolysed. The dissociation constant of aniline is given in one place as 0.0000046 and in another as 4.6×10^{-10} . In the chapters on the measurement of "acidité réelle" hydron concentration—a great variety of instruments and electrical connections is described in an admirable manner. English apparatus is under-represented. The selection of indicators is somewhat meagre. The chapter on "Buffers" is sufficient for the needs of the practical worker. There are chapters on medical and biological application, and some useful tables at the end.

The book is written in a critical and truly scientific spirit, and will serve as a useful corrective to a too implicit reliance upon theories many of which are only rough, if convenient, working hypotheses.

E. B. R. PRIDEAUX

A CATALOGUE OF BRITISH SCIENTIFIC AND TECHNICAL BOOKS. Supplement, 1925. Arranged by DAPHNE SHAW. Pp. viii + 166. London: British Science Guild, 1926. Price 2s. 6d.

The British Science Guild has already published two large catalogues of British scientific and technical books, the last, dated 1925, covering publications up to the end

of 1924. It has now been decided—wisely—to keep the catalogue up to date, however, by the issue of a supplement which, if sufficient support is forthcoming, will be published yearly.

The first supplement covers the year 1925, its appearance having been delayed by "national and other causes." In the previous volumes the subjects were grouped together and sub-headings were provided. This convenient arrangement has been abandoned in the supplement, the subjects having been arranged alphabetically and the use of subheadings discontinued. The system of classification is not one that would provoke an expert librarian to enthusiasm, but there is a good author index, and one soon learns that chemical engineering books must be sought for under chemical industry, which also includes chemical technology; that physical chemistry is included under chemistry, and that, for example, the section on "Photography" must be supplemented by search under both "Physics" and "Chemistry" for certain books on the subject. The supplement is published at the extremely modest price of half-a-crown, it is remarkably complete, and many will like to obtain it to keep their catalogues up to date.

TRAITÉ GÉNÉRAL DE LA FABRICATION DES COLLES, DES GLUTINANTS ET MATIÈRES D'APPRÊTS. By MAURICE DE KEGHEL. Bibliothèque des Actualités Industrielles. Pp. 714. Paris: Gauthier-Villars et Cie., 1926.

This work is a comprehensive treatise dealing with the manufacture, properties and applications of practically every adhesive of animal, vegetable, or mineral origin. The first 298 pages are concerned with the manufacture of glue, fish glue, and gelatin. This is described well, and such recent inventions as the clarification of gelatin liquors by ultrafiltration are fully treated. The second section deals with the properties of gelatin. The work of Procter and others is referred to adequately, and the relation between p_H and the hydrolysis of gelatin is discussed. The methods of analysis given are somewhat deficient from the point of view of the chemist, but physical tests are described very fully, including that by means of the Bloom gelometer. No less than 36 pages are devoted to the preparation of various adhesives and their uses. This forms an important feature of the book, similar information being given for every kind of adhesive, making it a veritable encyclopædia of useful information. It is not stated clearly, in all cases, whether the preparations are protected by patents. Casein, albumin, and isinglass glues are allotted 40 pages, making 402 in all devoted to animal products.

The second part of the book deals with all kinds of vegetable adhesives and gums in a similar manner, whilst the remaining section (40 pages) treats of waterglass, plaster of Paris, and other mineral adhesives and cements. The index is extensive, but the absence of a table of contents makes it rather difficult to find a particular subject quickly. The book contains a great deal of information both scientific and utilitarian, and will be very useful to all concerned in the manufacture of adhesives or the preparation of proprietary adhesive mixtures.

S. R. TROTMAN

PARLIAMENTARY NEWS.

Beet-Sugar Subsidy

In a written answer to Mr. A. V. Alexander, Mr. Guinness stated that the total amount of subsidy paid to the fourteen sugar-beet factories in respect of sugar and molasses in each financial year since the introduction of the subsidy was £492,040 4s. 7d. for 1924—25; £1,066,089 19s. for 1925—26; £3,225,858 15s. 1d. for 1926—27; £152,916 8s. 8d. for 1927—28 to July 16, 1927. The aggregate capitalisation to date of all the subsidised beet-sugar companies amounted to £6,118,756. Individual guarantees were made to six companies under the Trade Facilities Act totalling £2,215,000.—July 20.

Food Preservatives Regulations (Cream)

Replying to Mr. Lamb, Mr. Chamberlain said it was not necessary to introduce legislation to prohibit the reconstitution of cream so as to give the public the same protection as they now enjoy in the case of milk, as the existing provisions of the Sale of Food and Drugs Acts would prevent the sale of reconstituted cream as cream. The Preservatives Regulations will apply to the substitute equally as to genuine cream.—July 21.

Merchandise Marks Act

In reply to Mr. E. Brown, Sir P. Cunliffe-Lister said that inquiries, under Section 2 of the Merchandise Marks Act, 1926, had been held by the Standing Committee appointed by the Board of Trade, and two by the Standing Committee appointed by the Minister of Agriculture and Fisheries, the Secretary of State for the Home Department and the Secretary of State for Scotland. No Orders had yet been made, but an Order was laid in draft before the House on July 20 relating to certain descriptions of iron and steel, gold and silver leaf, and woven labels of textile materials.—July 21.

Safeguarding of Industries Act

In a written answer to Mr. E. Brown, Sir P. Cunliffe-Lister stated that since January, 1926, four applications had been referred to committees for inquiries to be held in accordance with the White Paper on Safeguarding of Industries. One of these applications related to certain articles of pottery, and the Finance Bill makes provision for an import duty of 28s. per cwt. on certain tableware of translucent or vitrified pottery.—July 22.

COMPANY NEWS

GAS LIGHT AND COKE CO., LTD.

Dividends have been declared for the half-year ended June 30 last, as follows:—On the 4% consolidated preference stock at the rate of £4% per annum; on the 3½% maximum stock at the rate of £3 10s. per annum, and on the ordinary stock at the rate of £5% per annum. Last year's interim payment on the ordinary stock was at the rate of £5 1s. 4d. % per annum.

SOUTH SUBURBAN GAS CO., LTD.

An interim dividend has been declared at the rate of 6½% per annum, less tax, on the ordinary stock.

CHEMICAL AND METALLURGICAL CORPORATION, LTD.

The seventh ordinary general meeting, held on July 25, was presided over by the chairman and managing director, Sir Frederick Mills, Bt., who stated that during the year research work had been carried on for discovering and

perfecting the best manner by which the platinoids, at present being produced in South Africa, might be most cheaply and advantageously recovered for the purpose of the refiners. This was a useful adjunct to the company's process, as it would work in very well with their main process. After the extraction of the platinoids they would retain and have for disposal the copper, nickel and precious metals, which would have cost very little to produce. Reverting to the main process, the operations at Stratford had now ceased as nothing remained to be discovered on the details of the process. The chairman was confident that within a very few months of starting the process the demand for expansion would be irresistible. With reasonable weather during the next three or four months, the whole of the buildings at Astmoor should be erected and substantial progress made. It was estimated that these works, which were now occupying about 15 acres, would be occupying probably more than 100 acres as years went by.

BRITISH OXYGEN CO., LTD.

The forty-first ordinary general meeting was held on July 14, Mr. K. S. Murray (chairman and managing director) presiding. Taking into consideration the fact that the company's business had been conducted for practically eight out of the twelve months of the financial year under the blight of the worst strikes the country had ever experienced; the shareholders might congratulate themselves on the fact that the same dividend as last year was possible. Since the termination of the coal strike there had been a steady increase in the output of oxygen. On several occasions recently their weekly sales of oxygen had considerably exceeded the highest previously recorded output. The chairman pointed out the analogy between oxygen supply factories and electric power stations, and claimed that prevailing conditions confirmed the wisdom of the company in establishing district oxygen factories of their own. These, he considered, would continue to be the main source of the company's revenue, although they were not neglecting the business of supplying private plants to customers. For the current year the prospects on the engineering side, as well as the oxygen side of the company's business, were distinctly encouraging. Among other work, they had completed several oxygen plants for the Government and private firms at home and abroad, whilst they had other contracts of a similar nature in hand. A total dividend of 8% was declared for the year, of which 2½% had been paid in December last, leaving £145,147 to be carried forward, compared with £172,374 brought in.

INVERESK PAPER CO., LTD.

In order to enable this company to acquire the preference shares of the International Pulp and Chemical Company, the directors propose to increase the capital by £1,000,000 to £2,200,000, by the creation of 400,000 ordinary and 600,000 6½% "B" preference shares of £1 each. Of these, 120,000 of the ordinary and the whole of the preference will be issued in exchange for the International Company's preference. The balance of 280,000 ordinary shares are being created in connexion with other profitable business into which the Board has recently entered.

NATIONAL SMELTING CO., LTD.

The net profit for 1926 was £330,752, compared with £99,261 for 1925. The sum of £100,000 has been transferred to reserve (against nil), and £27,820 (against nil) has been set aside for depreciation of plant, whilst £10,000 (against nil) has been appropriated to staff funds. The ordinary dividend is 10%, compared with 5%, involving an additional 2% to the preference holders, making their total dividend 10%. The sum of £18,582 has been carried forward, compared with £20,650 brought in. This company, which owns extensive works at Avonmouth and Swansea, and is also a large shareholder in the Burma Corporation, was formed with the co-operation of the British Government to increase the British production of zinc.

TANGANYIKA CONCESSIONS

The gross revenue of this company, which is largely interested in the big copper-producing company, the Union Minière du Haut-Katanga, amounted to £608,672, against £825,593 for 1925. The net profit, after meeting all charges and £77,025 written off shares and debtors, was £462,163, compared with £727,877. It is proposed to pay a final dividend on the ordinary shares of 2½%, making 7½% (same), leaving £455,575 to be carried forward, against £130,759 brought in.

MATHER AND PLATT, LTD.

An interim dividend has been declared of 5% on the ordinary shares, free of tax.

CANADA CEMENT CO., LTD.

The total profits for 1926, after providing for depreciation, amounted to \$2,274,007, and after deducting bond interest and reserves there was \$1,580,147. Dividends on preference stock absorbed \$735,000, and on ordinary stock \$810,000, leaving \$35,148, which, added to the amount brought in gives \$1,391,574. The profits for 1925 totalled \$2,314,006. The report states that there was a marked improvement in Canada's purchasing power during 1926 over 1925, which, with the decreased selling price of cement, resulted in the total consumption of cement in Canada for the year showing a substantial increase, and enabled the company's mills to operate to about 57% of their capacity. Export business showed a satisfactory and steady growth.

ENGLISH CHINA CLAYS, LTD.

An interim dividend has been declared on the cumulative preference shares at the rate of 7% per annum for the half-year ended June 30, 1927, payable on August 2 to shareholders registered on July 26.

HOME GROWN SUGAR, LTD.

At the seventh annual general meeting, held on June 15, Sir Ernest Jardine (Chairman and Hon. Managing Director), who presided, said that the Kelham factory performance had exceeded the previous year's excellent record. During the last season 83,654 tons of beet had been worked, compared with 36,757 tons in 1925, an increase of 128%. Their throughput had averaged 775 tons of beet per day. Beet grown on 9840 acres supplied by 2665 growers had been received, as against last year's figures of 1514 growers and 5844 acres. The average sugar content of

beets received was 17.62%, against 16.20% in 1925. In the year under review £240,496 was paid to growers, or an average price of 59s. 4d. per net ton, compared with £102,410 and 55s. 9d. respectively for 1925.

Under the agreement with the English Beet Sugar Corporation, Ltd., the company's share of the trading profit from the working of the Kelham factory was £159,011, compared with £42,115 in 1925, which had been used to discharge its liabilities. £39,791 had been applied to the cancellation in full of the profit notes held by the Government, a liability payable from surplus profits of amounts advanced by the Government in the past to pay the guaranteed dividend of 5% when no profits were available. The directors felt that no further call upon the Government guarantee, which expires on April 1, 1930, would be necessary. In addition to the above repayment the whole of the balance of the first and second mortgages, which originally stood at £75,000 and £40,000 respectively, had been discharged, thus giving the Government mortgage priority of charge over the company's factory and other fixed assets. Further, the Government mortgage, which stood at £125,000, had been reduced to £100,000, and any future available profits would be applied, subject to the 5% dividend to the shareholders under the articles of association, to the further reduction of that liability. The success of the company during the last few years being due largely to the partnership arrangement with the English Beet Sugar Corporation, Ltd., an extension of this partnership had been arranged with the corporation for a further seven years on terms satisfactory to the company. The profit on the estate and farm was £4787, compared with £1961 for the previous year; gross receipts from the cultivation of 272 acres of sugar beet upon the estate amounted to £8806, or over £32 an acre. The average yield was 12 tons 13 cwt. per acre, and the average sugar content 17.9%. During the year certain portions of the Kelham estate had been sold and the moneys applied to mortgage repayment.

NEW TAMARUGAL NITRATE CO., LTD.

The gross profit for the year to July 31, 1926, was £100,145, which includes the profit earned by the London Nitrate Co. for July, compared with £203,908 for 1925. The sum of £50,000 has been credited to maintenance of plant, buildings, etc. fund, and with £66,037 brought forward, and the undivided balance of the London Nitrate Company's profit at July 1, 1926, of £4,720, there was an available total of £105,056, which was reduced to £97,101 by interest and amortisation of the Income bonds. An interim dividend of 5% was paid last September. For 1925 the full dividend was 35%. It is proposed to allocate £17,306 to reserve fund, and to carry forward £69,805. During the year the capital was raised from £277,000 to £550,000. At July 1 last an agreement was made to buy the assets of the London Nitrate Company, and to effect the purchase the capital was raised to £1,000,000.

TARAPACA AND TOCOPILLA NITRATE CO., LTD.

Owing to the unsatisfactory position of the nitrate industry and the uncertainty of its future, the directors have decided not to recommend the distribution of any dividend for 1926.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—0s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoneac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/85.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.

Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £8 10s.—£9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£6 15s.—£10 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 9d.—4s. per gal., 60% O.P. Solvent, 3s. 11d.—4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£40 15s.—£41 10s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 4½d.—2s. 8d. per gal.
 Acid Cresylic, 99/100.—2s. 8d.—2s. 9d. per gal. 97/99.—2s. 1½d.—2s. 4½d. per gal. Pale, 95%, 2s.—2s. 3d. per gal. Dark, 1s. 9d.—2s. 1d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 11d.—1s. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 2d. per gal., ex works in tank wagons; Pure, 1s. 7d.—2s. 3d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 8d.—1s. 10½d. per gal. Pure, 2s.—2s. 3½d. per gal.
 Xylol.—2s.—2s. 4d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—8½d. per gal. Middle Oil, 7½d.—7¾d. per gal. Heavy, 8¾d.—8½d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/160, 1s. 2d.—1s. 6d. per gal. Solvent 95/160, 1s. 5d.—1s. 6d. per gal. Solvent 90/190, 11d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—80s.—87s. 6d. per ton, f.o.b. according to district. Nominal.
 Pyridine.—90/140.—7s.—13s. per gal. Nominal. 90/180.—4s. 6d.—5s. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis. d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—5 cwt. lots Cryst. 41s. per cwt. Powder 45s. per cwt. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 7½d.—1s. 10d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 3d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 9d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzophenanthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—5 cwt. lots, Crystal 25s. per cwt. Powder 27s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d. per lb. Potassium.—1s. 11d. per lb. Sodium.—2s. 2d. per lb. Granulated ½d. per lb. less. All spot.
 Calcium Lactate.—1s. 3½d. per lb.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Crocote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively;
 730.—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamino.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—1 lb., 16s. per doz.; ½ lb., 9s. 6d. per doz.; ¼ lb., 6s. 6d. per doz.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 11s.—14s. 6d. per lb., according to quantity; Liquid (95%), 12s. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferriyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potassa. Tartrate (Rochelle Salt).—90s.—97s. 6d. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure reocryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonol.—6s. 6d.—6s. 9d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Puriss.—10s. 6d.—10s. 9d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
 Aubepine (*ex Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 6d. per lb.
 Ethyl Cinnamate.—6s. 6d. per lb.
 Ethyl Phthalate.—2s. 9d. per lb.
 Eugenol.—9s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—17s.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.
 Camphor.—70s. per cwt. Cananga, Java, 26s. per lb.
 Cassia, 80/85%.—7s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%, 22s. 6d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb.
 Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 18s. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Sept. 17th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on August 4th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Barrs and Barrs. Recovery of suspended matter from liquors. 18,711. July 14.
 British Dyestuffs Corp., Ltd., Saunders, and Williams. Decomposition of substances by rapid heating. 18,942. July 16.

Cuker and Romers. Diffusion process and apparatus. 18,462. July 11. (Czecho-Slovakia, 10.7.26.)
 Gowshall. Filter-presses for extracting liquids from viscous substances. 18,479. July 12.
 Hartstoff-Metall A.-G., and Kramer. Pulverising mills. 18,454. July 11.
 Henkel et Cie. Purifying chemicals. 18,494. July 12. (Ger., 24.12.26.)
 I.-G. Farbenind. Feeding materials into high-pressure vessels. 18,386. July 11. (Ger., 10.7.26.)
 Kock and Quitt. Evaporating-apparatus. 18,775. July 15.
 Maschinenfabrik Buckau, and Michaelis. Drying-apparatus. 18,830. July 15.
 Menzel A.-G., and Menzel. Heat-exchange devices. July 14.
 Nivling. Viscosimeters. 18,645. July 13. (U.S., 13.7.26.)
 Prior. Mixing-machines. 18,923. July 16.
 Rosenheim. Absorbing agent. 18,523—4. July 12. (Ger., 30.7.26 and 27.4.27.)
 Smith and Smith. Mixing apparatus. 18,872. July 16.
 Wade (Silica Gel Corp.). Catalysing gaseous reactions. 18,549. July 12.

I.—Complete Specifications

335 (1926). Gilchrist & Co. Separating solids and gases from liquids. (245,476.)
 9492 (1926). Soc. Anon. Manuf. des Glaces et Prod. Chem. de Saint-Gobain. Grading solid substances contained in liquids. (252,683.)
 9911 (1926). Poole. Vapour-pressure thermometers. (273,838.)
 15,156 (1926). Young, and Metropolitan-Vickers Electrical Co. Heat-exchangers. (273,886.)
 8073 (1927). British Furnaces, Ltd., and Smith (Surface Combustion Co.). Heating furnaces. (274,003.)
 *14,101 (1927). I.-G. Farbenind. Continuously carrying out exothermic reactions. (274,048.)
 *18,386 (1927). I.-G. Farbenind. Feeding materials into high-pressure vessels. (274,122.)
 *18,462 (1927). Komers and Cuker. Diffusion process and apparatus. (274,131.)

II.—Applications

Brown, and Simon-Carves, Ltd. Coke ovens. 18,651. July 14.
 Cooper, Henshaw, and Holmes & Co. Treatment of coal gases etc. 18,844. July 15.
 Feige. Low-temperature distillation etc. of coal. 18,439. July 11. (Ger., 16.7.26.)
 Haynes. 18,824. See VII.
 Johnson (I.-G. Farbenind.). Production of gaseous hydrocarbons. 18,597. July 13.
 Koppers Co. Purification of gases etc. 18,724 and 18,934. July 14 and 16. (U.S., 5.11.26 and 7.3.27.)
 Liesens. Composition fuel. 18,366. July 11.
 Perl and Smith. Treating heavy hydrocarbons. 18,542. July 12.
 Soc. Internat. des Proc. Prudhomme-Houdry. Manufacture of synthetic liquid fuels. 18,491. July 12. (Fr., 3.8.26.)

II.—Complete Specifications

8101 (1926). Petroleum Chemical Corp., and Stevenson. Cracking of petroleum oils and the carburetting of water-gas. (273,781.)
 18,634 (1926). I.-G. Farbenind. Purification of hydrocarbons. (255,905.)
 23,429 (1926). Simpson. Low-temperature carbonisation. (273,935.)
 5165 (1927). Wiberg. Reducing to carbon monoxide the carbonic acid gas content in gases. (266,729.)
 6880 (1927). Allgem. Ges. f. Chem. Ind. Converting high-boiling hydrocarbons into low-boiling hydrocarbons. (273,999.)

*13,980 (1927). Wetherbee, Grant, and Hanna. Production of artificial fuel. (274,046.)

*18,234 (1927). Szikla and Rozinek. Gasification of fuel. (274,110.)

IV.—Applications

British Dyestuffs Corp., Ltd., and Thornley. Vat dyes. 18,828. July 15.

British Dyestuffs Corp., Ltd., and Walker. Manufacture of condensation products of phenols. 18,829. July 15.

British Dyestuffs Corp., Ltd., Baddiley, Shepherdson, and Thornley. Manufacture of vat dyes. 18,943. July 16.

Carmichael (I.-G. Farbenind.). Manufacture of amino-anthraquinones. 18,435. July 11. Manufacture of water-soluble anthraquinone glycosides. 18,746. July 14.

Haller and Kappeler. Manufacture of condensation products of arylamines. 18,936. July 16. (Switz., 16.7.26.)

I.-G. Farbenind. Manufacture of azo-dyestuffs. 18,430. July 11. (Ger., 9.7.26.)

I.-G. Farbenind., and Thaus. Manufacture of non-dyeing thio derivatives of phenols. 18,436. July 11.

Imray (I.-G. Farbenind.). Manufacture of vat-dyestuffs. 18,545. July 12.

Johnson (I.-G. Farbenind.). 18,595. See XX. Production of condensation products from phenols etc. 18,715. July 14.

Scottish Dyes, Ltd., Harris, Thomes, and Wylam. Dyes etc. 18,606. July 13.

Soc. of Chem. Ind. in Basle. Manufacture of dyestuffs. 18,432. July 11. (Switz., 10.7.26.)

IV.—Complete Specifications

6920 (1926). I.-G. Farbenind. Manufacture of halogen-dibenzopyrenequinones. (219,147.)

8780 (1926). Soc. Chem. Ind. in Basle. Manufacture of vat-dyestuff preparations. (250,251.)

20,956 (1926). British Dyestuffs Corp., Everatt, and Rodd. Preparing aromatic amines and derivatives thereof. (273,923.)

*16,752 (1927). I.-G. Farbenind. Manufacture of new amino-alkylamino derivatives of aromatic amino-oxy and polyamino compounds. (274,058.)

*18,068 (1927). I.-G. Farbenind. See XX.

*18,184 (1927). I.-G. Farbenind. Manufacture of naphthalene-1:4:5:8-tetracarboxylic acid. (274,103.)

*18,430 (1927). I.-G. Farbenind. Manufacture of azo-dyestuffs. (274,128.)

*18,432 (1927). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (274,130.)

V.—Applications

Benthall, Bird & Co., Cable, Godfrey, Spencer, Tarlton, and Wheeler. Extraction of cellulose. 18,740. July 14. (Br. India, 28.5.27.)

Brysilk, Ltd., and Schubert. Manufacture of artificial silk. 18,769—70. July 15.

Ruzicka and Shuttleworth. Manufacture of cellulose esters. 18,753. July 14.

V.—Complete Specifications

747 (1926). Dreaper. Manufacture of artificial silk etc. (273,354.)

9621 (1926). Calico Printers' Assoc., Lantz, and Keyworth. Treatment of cotton fabrics containing artificial silk. (273,830.)

*16,500 (1927). Wolff & Co., Czapke, and Weingand. See VI.

*18,167 (1927). Duhamel, and Comp. Gén. des Ind. Textiles. Washing or cleaning wool. (274,100.)

VI.—Complete Specifications

9503—4 (1926). British Celanese, Ltd., and Ellis. Dyeing, printing, or stencilling cellulose acetate. (273,819—20.)

16,414 (1926). Galvin. Preparation for sizing textiles. (254,720.)

30,160 (1926). Heberlein & Co. Chemically varying vegetable or artificial fibres. (272,165.)

*16,500 (1927). Wolff & Co., Czapke, and Weingand. Imparting a silk lustre to bodies produced from viscose etc. (274,054.)

*17,524 (1927). British Celanese, Ltd. Treating fabrics or articles containing fibres or threads of organic derivatives of cellulose. (270,074.)

*18,067 (1927). Durand & Huguenin. Dyeing or printing with vat-dyestuffs. (274,094.)

VII.—Applications

British Dyestuffs Corp., Ltd., Payman, and Piggott. Removal of free chlorine etc. from fluid mixtures. 18,403. July 11.

Carmichael (I.-G. Farbenind.). Manufacture of finely-divided iron oxide. 18,747. July 14.

Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. Production of alkali hydride. 18,850. July 15. (Ger., 23.8.26.)

Haynes. Manufacture of carbon dioxide. 18,824. July 15. (U.S., 27.9.26.)

I.-G. Farbenind. Treatment of nitrate earths. 18,716. July 14.

Oesterreichische Chem. Werke. Manufacture of stable solutions of peroxides etc. 18,023. July 13. (Austria, 16.9.26.)

Siemens & Halske A.-G. Generation of ozone. 18,838. July 15. (Ger., 26.8.26.)

Soc. Internat. des Proc. Prudhomme-Houdry. Treatment of metallic etc. compounds by gaseous agents. 18,490. July 12. (Fr., 23.7.26.)

VII.—Complete Specifications

10,086 (1926). Salzwirk Heilbronn, Lichtenberger, and Flor. Obtaining sulphur from the sulphates of earth alkalis. (273,841.)

14,859 (1926). Hart, Harris, Hart & Co., Ltd., and Refiners, Ltd. Manufacture of ferric sulphate. (273,883.)

28,388 (1926). Rhenania-Kunheim Verein Chem. Fabr. Production of solid ammonium carbonate. (262,408.)

9035 (1927). I.-G. Farbenind. Manufacture of alkali bisulphate. (268,817.)

*1173 (1927). Soc. d'Études Minières & Indus. Manufacture of ammonia. (274,023.)

*18,106 (1927). Caro and Frank. Production of compounds of nitrogen and oxygen from ammonia. (274,099.)

IX.—Complete Specifications

4101 (1927). Abrey. Manufacture of artificial stone. (273,989.)

10,047 (1927). Portland-Cementwerk Balingen. Manufacturing acidproof hydraulic binding-agents. (269,549.)

X.—Applications

Bosse, Lauch, Richter, and Siegelberg & Koch. Metallising process. 18,425. July 11.

Brook, Brook, and Brook. Solders for aluminium etc. 18,763. July 15.

Gofmann and Racheff. Welding metals etc. 18,706. July 14. (Fr., 15.7.26.)

Picard and Sulman. Extraction of tin etc. from ores etc. 18,548. July 12.

Sobek. Blast furnaces. 18,807. July 15.

Soc. Internat. des Proc. Prudhomme-Houdry. 18,490. See VII.

Sundberg. Electrodeposition of copper etc. 18,635. July 13. (Sweden, 13.7.26.)

Twynam. Recovery of tin from tin scrap. 18,348. July 11.

Verein Stahlwerke. Manufacture of steel. 18,688. July 14. (Ger., 13.5.27.)

X.—Complete Specifications

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Austria*: Leather, artificial resin, casein, non-inflammable celluloid (55). *Canada*: Raw materials for the paint, paper, varnish, polish industries (45); raw materials for the rubber, paint industries [except lithopone, ground barytes, whiting and dry colours] (48). *China*: Glass, glassware, chinaware, paint, varnish, soaps, perfumery, medicines (68). *Germany*: Crepe and sheet rubber (56); leather (57); crude metals and metal waste (60). *Greece*: Pharmaceutical products (62). *Holland*: Artificial silk (63). *Italy*: Sulphate of ammonia (66). *New Zealand*: Steel, iron, concrete (51).

British Industries Fair

Within five weeks of the despatch of application forms 100,000 sq. ft. of space—twice the figure for the same

period last year—was booked in the White City, and the Department of Overseas Trade has now sent a letter to manufacturers who have not yet applied reminding them that space cannot be guaranteed after July 30. The Fair will be held simultaneously in London and Birmingham from February 20 to March 2, 1928.

Change of Address

Messrs. Geoffrey Martin & Taylor, Ltd., have removed their offices from Broad Street Avenue to Cecil Chambers, Strand, W.C.2.

Fine Chemicals

The British Drug Houses, Ltd., has published a new issue of the Catalogue of B.D.H. fine chemical products. The list is divided into convenient sections embracing organic and inorganic chemicals; analytical reagents A.R.; volumetric solutions and a variety of essential products for the laboratory; a wide range of indicators, in addition to the B.D.H. Capillator, Comparator, and soil testing outfit; staining and other microscopic requisites; aniline dyes; and minerals. As with previous issues of the catalogue, this new one will be indispensable for laboratories of every kind.

News from Advertisements

There is a vacant lectureship in fuel technology at the Imperial College of Science and Technology (p. vi).

A Coal Research Fellowship at the Imperial College of Science and Technology is offered in connection with Sensible Heat Distillation, Ltd. (p. vi).

Students will be interested in the facilities offered at the Imperial College of Science and Technology for study and research in fuel technology, chemical engineering and electro-chemistry (p. vi).

An organic chemist requires a post on the commercial or research side of the chemical industry (p. vi).

Chemist requires position, preferably for foods and food preservatives (p. vi).

Chemical engineer requires situation in Europe or Overseas (p. vi).

There are 105 firms represented under the various headings in our Buyers' Guide.

New B.D.C. Dyestuff

The latest pattern card of the British Dyestuffs Corporation, Ltd., draws attention to an addition to the B.D.C. range of sulphur colours Thionol Brown G. This colour gives a bright yellowish brown shade, and is applicable to all types of cotton materials where fastness to washing is of primary importance, whilst its very good fastness to cross dyeing makes it of particular interest for dyeing cotton warps, such as are used for the production of mohair linings and union gaberdines. It is also of interest for dyeing cotton materials which are subsequently to be rubber proofed, as it is fast to the "cold cure" vulcanising process.

JOURNAL of THE SOCIETY OF CHEMICAL INDUSTRY CHEMISTRY & INDUSTRY

Official Organ of the Institution of Chemical Engineers' of the Coke Oven Managers' Association, and of the Federal Council of Pure and Applied Chemistry

which consists of Representatives from

The Chemical Society, the Society of Chemical Industry, the Association of British Chemical Manufacturers, the Institute of Chemistry, the Society of Public Analysts, the Faraday Society, the Institute of Brewing, the Society of Dyers and Colourists, the Society of Glass Technology, the Iron and Steel Institute, the Ceramic Society, the Institution of Gas Engineers, the Society of Leather Trade Chemists, the Royal Photographic Society, the Mineralogical Society, the Biochemical Society, the Oil and Colour Chemists' Association, the Institute of Metals and the Royal Agricultural Society.

VOL. 46 **NEW
SERIES**

LONDON, AUGUST 5, 1927

No. 31

EDITORIAL

The Institution of Chemical Engineers

THIS Institution has just published its fourth volume of Transactions, those for the year 1926. They are, like the previous volumes, well printed and well got up, and contain papers of considerable importance. A sound knowledge of the principles of chemical engineering and of the places where exact information on matters of detail may be found is essential to modern industrial chemistry. It is the foundation on which economy and prosperity can be built up. Where men build on false grounds, the more they build, the greater is the ruin; we, therefore, attach the utmost importance to careful and methodical investigations of chemical engineering and welcome their publication, whether they appear in the Transactions of the Institute or in the JOURNAL OF THE SOCIETY OF CHEMICAL INDUSTRY, or in the volumes issued by any group or section of the Society. The papers included in this latest volume of Transactions are mainly records of accurate observations and the grouping of these into laws of wide applicability: there is nothing imaginative about them: they are warranted to drive solid bolts of fact through the thickest skulls, as one of our great controversialists wrote some years ago. Sir Frederic Nathan's Presidential Address, including his shrewd observations on labour, the cost of materials, and general charges, we have already praised in this journal. The other papers include one on "Filtration," by Mr. A. J. V. Underwood, two on "Corrosion," by Mr. U. R. Evans and Mr. P. Parrish, respectively, two on "Chemically-resistant steels," by Dr. W. H. Hatfield and by Messrs. T. G. Elliott and G. B. Willey, and a paper on "Sugar from wood," by Dr. Ormandy. In some of these papers mathematics play an important part. The methods of algebra and the calculus are powerful and rigid, and when the data are accurate, and the methods of treating them are also accurate, we should expect valuable deductions. But when we remember that algebra enables us to prove that $2 \log 2 = \log 2$ and that the calculus enables us to prove that $\frac{1}{2}\pi = -\frac{1}{2}\pi$, we are comforted if the mathe-

matical results square with a reasonable explanation. We are never quite so confident with the mere differentiation of curves representing slightly inaccurate experimental observations. There are other important papers on the "Extraction of fats," by Prof. J. W. Hinchley and Mr. L. J. Simon and on "Air chlorination," by Dr. Geoffrey Martin; but, really, all the papers appear to us to be of the type which should appear in the transactions of a learned Institution. We congratulate the Institution on publishing this volume more promptly than in the past, and on improving it by the addition of an index.

A National Gas Supply

We are all more or less familiar with the State-controlled scheme for the centralisation of the generation of electricity in huge stations, with the object of eliminating inefficient producers and cheapening the cost of electricity. When the scheme was first put forward, many people wondered what would be the attitude of the gas industry, and much discussion naturally followed. We are not at all sure if the suggestion was then put forward that gas could be distributed nationally just as conveniently as electricity, but the suggestion is now progressing towards actual accomplishment, though not in this country. Some time ago we announced the initiation of a scheme for the supply of heat and power for the whole of Germany from the Ruhr coalfields. The scheme, we now learn, is to be carried out by the A.-G. für Kohlenverwertung, and it appears likely that Germany will eventually obtain its gas supply from one area. Pipe lines are to be laid to cover the whole country, and will be fed from various cokeries, whilst stations will be erected to purify the gas, control its quality and pump it over long distances. It is claimed that the transmission of gas over long distances has the virtues of economy and efficiency. According to *The Times* the average consumption of gas per head of population in Germany is less than a third of that in this country, but enormous sources of supply still await exploitation in the Ruhr. It will

be interesting to see how the scheme progresses, particularly as it may affect the northern German market for British coal, and will certainly have an important bearing on the grading of coal and other mining questions.

The Thermionic Valve

It is not very long since we made brief mention in these columns of some of the applications which the thermionic valve, or three electrode vacuum tube, might have in chemistry. At that time we were not aware that the thermionic valve had been used to any other than a small extent in some of the more obvious physico-chemical work, such as the determination of the electrical conductivity of electrolytes or of hydrogen-ion concentration, the analysis of gases, and so on. But anyone who considers the use of the valve in the detection and amplification of broadcast signals cannot fail to realise that in it we have a tool which offers very interesting possibilities, not only for chemistry, but for chemical industry at large. We remember a demonstration in London a year or two ago, when the valve was used in an appropriate manner to indicate audibly when the washing of a particular product was finished; its properties, utilised in an oscillating circuit, have been employed to prevent the pitting of small metal parts from a factory; and we are even promised that, by its aid, the mere approach of a crackman to a safe will be announced by a clamorous uproar. It was remarked recently in the United States that burglaries were becoming difficult to detect as the burglars had begun to take correspondence courses in chemistry; and now, we suppose, their equipment will need completion by further courses in physics. From a paper read by Mr. H. C. Weber before a recent meeting of the American Institute of Chemical Engineers, we find that the number of industrial applications is growing rapidly. The wireless valve is being used to measure velocities of gases when the velocity is too low for the Pitot tube to be used; for the measurement of pressures, particularly high pressures which are suddenly developed, as in work with explosives; and for the measurement of small distances of the order of magnitude of less than one hundred millionth of an inch. Already the vacuum tube is used industrially to follow the changes in rubber during vulcanisation, to maintain a constant thickness of rubber on cloth in the manufacture of rubber-coated goods, and to maintain a constant amount of moisture in paper pulp during its passage over the rolls of pulp-drying machines. Measurements of conductivity with the aid of the valve are used by the sugar refiner to control the ash content of sugar solutions. An interesting example of the extremely small measurements which are made possible and easy of accomplishment by the vacuum tube was recently given in this country, when an oak table made of wood, an inch and a half thick, was found to bend when an ordinary penny piece was placed upon it. Such a tool should appeal to the chemical engineer, with his demands for accurate measurement, but efficient as the thermionic valve is in respect of the work which can be accomplished with it, we can hardly think that its efficiency in terms of current consumed will meet with his entire approval even though its demands are rated in fractions of watts rather than in kilowatts.

THE INVERSION OF REACTIONS IN CATALYSIS

By M. PAUL SABATIER

(Concluded.)

9. These different bodies, metals or oxides, which are deoxidation catalysts, thanks to their aptitude to fix oxygen for a short time and form unstable compounds, will be, for the same reason, oxidation catalysts. Platinum black at the ordinary temperature produces the direct oxidation of ethyl alcohol by the oxygen of the air. Without a catalyst, at normal temperature, such oxidation is negligible. With platinum, we have successively and very speedily these reactions:--

and an identical effect is very vigorously produced at about 200° by the oxides of manganese, iron, cobalt, nickel, etc. The action is, moreover, complete because the catalysts are unable to start the inverse reaction of aldehyde on water vapour. More complex than this is the mechanism of the catalyst in the industrial preparation of nitric acid by the oxidation of ammonia gas in the presence of filaments or thin plates of platinum at about 1000°; the reaction $2\text{NH}_3 + 5\text{O} = 2\text{NO} + 3\text{H}_2\text{O}$ is very exothermic and not reversible. It is almost complete, and in certain works can give a yield of 96%, a small loss being, nevertheless, caused by the side reaction in which nitric oxide is destroyed under the influence of the incandescent platinum. When the two contrary reactions of oxidation and deoxidation are possible under the same physical conditions, thus giving rise to an equilibrium, the same catalysts act to speed up both reactions and rapidly lead to the limit. This takes place in the industrial preparation of sulphuric anhydride by the contact process. Platinised asbestos or ferric oxide simultaneously catalyse the two inverse reactions: $\text{SO}_2 + \text{O} = \text{SO}_3$, which gives off a good deal of heat, and $\text{SO}_3 = \text{SO}_2 + \text{O}$, which is caused by the rise in temperature and becomes of greater importance as the temperature rises. The yield of anhydride is greater when the temperature is lower, but the speed of the reaction diminishes at the same time. In practice, the most favourable temperature is 550° with platinum and 650° with ferric oxide. The production is favoured by the presence of an excess of oxygen, and in accordance with the principle of the displacement of equilibrium, since the formation of anhydride corresponds to a diminution of the volume, an increase of the pressure should increase the yield.

10. Many instances of the hydrogenating activity of finely-divided platinum (platinum black or sponge) have been recorded, but I have shown, in conjunction with M. Senderens (1899—1905), that finely divided nickel, prepared by reducing the oxide, is an incomparably more powerful hydrogenating catalyst of almost universal efficacy. Cobalt, iron and copper, obtained by the reduction of their oxides, possess a similar catalytic power, but to a lesser and not so general a degree. As I have already indicated above, this common property of these different metals—nickel, cobalt, platinum, iron, and copper—can be explained by the immediate formation on the surface of the particles in the presence of

gaseous hydrogen of a thin layer of hydrides capable of giving off very quickly atomic hydrogen to materials capable of making use of it. But these unstable hydrides, instead of being produced from gaseous hydrogen, can also be produced by means of hydrogen furnished by various compounds, and so assist in the dehydrogenation of these. This dehydrogenating power has been long known to be a property of certain metals. Ammonia gas is rapidly decomposed into its elements when it is led through a tube heated to red-heat, filled with iron or copper turnings, and it has been found that the metal is modified in its structure and becomes brittle, which seems to indicate that it has been in temporary combination with one of the gaseous constituents of the system. Many of the hydrogenations effected by the aid of metallic catalysts, whether they correspond to the simple addition of hydrogen to a molecule or whether they take place in compounds of oxygen, produce at the same time water vapour, give out a good deal of heat, and are practically complete and not reversible. This is what happens when ethylene or acetylene are treated in the presence of finely-divided nickel with an excess of hydrogen. At the ordinary temperature they are completely transformed into ethane. It is only at higher temperatures that the reaction is interfered with by dehydrogenating actions and decomposition, which the metal tends to bring about with these hydrocarbons.

The reduction of oxides of nitrogen and of organic nitro-derivatives by means of nickel or copper catalysts is not limited by the inverse reaction :

There is no contrary reaction of methylamine on water vapour. The same thing appears in the hydrogenation of carbon monoxide with the aid of nickel at about 180°. There is complete production of methane alone according to the formula $\text{CO} + 3\text{H}_2 \rightarrow \text{CH}_4 + \text{H}_2\text{O}$. But above 235° a complication is introduced by the special action which carbonic oxide exerts on the metal $2\text{CO} \rightarrow \text{C} + \text{CO}_2$; the carbon thus separated being able in turn to act on the water vapour and the carbonic anhydride being itself hydrogenated to form methane, thus giving rise to a complicated equilibrium.

11. The conditions are quite different when the hydrogenation reaction is limited by the simultaneous existence of the inverse reaction. In this case there is the possibility, by choosing suitable conditions in which to work, of carrying out either hydrogenation or dehydrogenation. As we have already pointed out above, the formation of hydriodic acid starting from iodine vapour and hydrogen is a limited reaction. The combination of these two bodies mixed in equal volumes begins very gently at above 200°, rather more quickly at 350°. At these same temperatures, hydriodic acid is slowly destroyed, and the result is a limit corresponding to about 80% of the hydriodic acid formed, a limit which is not reached until after a long period, over 200 hrs. at 350°. The presence of a catalyst such as finely-divided platinum enormously accelerates both these opposing reactions, and so the limit, which in other respects is identical with that obtained without a catalyst, is reached almost immediately. In the reactions which give rise to but little heat and do not produce a change in

the volume of gas, the law of displacement of the equilibrium shows that the limit will scarcely be modified by a rise in temperature or by an increase of pressure, but the proportion of iodine combined will increase if we increase the proportion of hydrogen in the mixture. In the presence of an excess of hydrogen a small quantity of iodine should be almost entirely taken up. The conditions are more favourable in most cases of hydrogenation by addition, usually accomplished with an important production of heat and with diminution of the volume of gas: for instance, the hydrogenation of aldehydes or acetones into alcohols, and the hydrogenation of aromatic compounds into cyclohexane compounds. Thus, in the case of the aldehydes, the positive reaction $\text{R}\cdot\text{COH} + \text{H}_2 \rightarrow \text{R}\cdot\text{CH}_2\text{OH}$, carried out in the presence of nickel, is at temperatures below 180° and under ordinary pressure almost complete except in the presence of an excess of hydrogen. This makes, in practice, an excellent means of preparing the primary alcohols, starting from aldehydes, the product condensed beyond the mouth of the catalyst tube containing only a very small proportion of unchanged aldehyde. Copper obtained by reduction also effects the same catalysis, but less quickly and with not so high a yield, though this is improved if the pressure is increased, according to the law of displacement of the equilibrium. In accordance with the same principle, raising the temperature would be unfavourable, and, in fact, it is found that at about 250° to 300° the inverse reaction, the break-down of alcohol to form aldehyde, $\text{R}\cdot\text{CH}_2\text{OH} \rightarrow \text{H}_2 + \text{R}\cdot\text{COH}$, would tend to predominate, and under ordinary pressure, with reduced copper, makes a good method of preparing aldehydes. The proportion of alcohol in the condensate is small, and is still smaller if, as Bouveault* has shown, we work with a reduced pressure. A greater elevation of the temperature which at first sight might appear to be advantageous would, on the contrary, be unfavourable, because it introduces the destructive action of the metal on the aldehyde, $\text{R}\cdot\text{COH} \rightarrow \text{RH} + \text{CO}$, an action which, in the case of copper, begins to be noticeable above 260° in the case of methanol, but which is less noticeable below 350° for the other aliphatic aldehydes. With nickel, the decomposition of the aldehydes is much more important; this metal, acting even at 180° on alcohol vapour without hydrogen, begins to decompose the aldehyde immediately the alcohol is dehydrogenated. Nickel is used with great advantage in the hydrogenation of aldehydes, but, on the contrary, is unsuitable for their preparation from the primary alcohols.

12. Reduced nickel, acting below 250° on benzene, or its homologues, toluene, xylene, cumene, cymene, etc., or on the phenols, aniline and its homologues, assists in the direct fixation of three molecules of hydrogen on the aromatic molecule. The temperature of 180° is particularly suitable, because at this temperature, under ordinary pressure, the fixation is sufficiently rapid and the inverse reaction does not take place to any appreciable extent. We can thus obtain a total transformation of benzene into cyclohexane, there being no attack by the sulphonitric mixture. But if we conduct the operation above 240°, for instance at 300°.

* Bull. Soc. Chim. (4), 3, 50 and 119, 1908.

the inverse reaction $C_6H_{12} \rightleftharpoons C_6H_6 + 3H_2$ takes place to an extent which increases as the temperature rises. At 300° there is therefore a limited reaction, the system involving the simultaneous presence of benzene, cyclohexane, and hydrogen; the proportion of benzene increases, as the temperature rises, to about 30% at 400° . The action of nickel on the vapour of pure cyclohexane produces a similar mixture. In a current of hydrogen the stability of cyclohexane is found to increase; the same effect is produced by an increase of pressure. The direct hydrogenation of phenol gives rise to similar results. In presence of reduced nickel in a current of hydrogen, which is kept in excess, below 170° , the phenol is entirely converted into cyclohexanol, but if the temperature is raised above 200° the inverse reaction, dehydrogenation of the cyclohexanol, gradually commences. At about 230° roughly one quarter is decomposed into phenol, even in a current of hydrogen; at 360° the hydrogenation of the phenol is practically nil, and, on the contrary, the dehydrogenation of the cyclohexanol would be complete at ordinary pressure, but an increase of pressure would make this compound stable. Quite similar results are found in the direct hydrogenation of toluene, xylenes, etc.; working with nickel below 200° , their transformation into cyclohexane hydrocarbons is practically complete; above 250° it is limited because they are dehydrogenated by the metal to an extent which increases as the temperature is raised. In the hydrogenation of aniline at about 190° , the production of cyclohexylamine and dicyclohexylamine (which is always produced) is limited by the tendency of the inverse action towards aniline and diphenylamine. When naphthalene, in the presence of nickel below 175° , is treated directly with an excess of hydrogen, it is practically completely converted into decahydride (decalin), but even at 200° this latter dissociates into tetrahydride (tetralin), and at 300° this latter in its turn is almost completely decomposed into naphthalene. Anthracene gives rise to similar conditions, because the perhydride $C_{14}H_{24}$ is dehydrogenated in contact with nickel at 200° into octohydride, at 260° into tetrahydride, and at 300° into anthracene. Another remarkable inversion of catalysis is found in the direct hydrogenation of the nitriles, which easily and completely takes place at 200° with divided nickel in an excess of hydrogen, producing the corresponding amine $R \cdot CN + 2H_2 = R \cdot CH_2 \cdot NH_2$. But at 300° , in the absence of hydrogen, the amine $R \cdot CH_2 \cdot NH_2$ in contact with nickel is, on the other hand, dehydrogenated into nitrile and free hydrogen which immediately acts upon a portion of the amine to produce ammonia gas and a hydrocarbon:

so that the reaction practically becomes

13. The different examples which we have just quoted show that in the majority of cases hydrogenation catalysts can reverse their functions and become dehydrogenators. As the fixation of hydrogen is generally exothermic, and corresponds with a diminution in the number of the molecules, we see that it will be best to effect

fixation at as low a temperature as possible, and it would be advantageous to carry out the operation with an increase of pressure. A rise in temperature and a diminution of the pressure should, on the contrary, assist the exclusive character of the dehydrogenation reaction. From the aptitude of a catalyst for dehydrogenation we may be permitted to assume its aptitude for hydrogenation. In studying with M. Mailhe the catalytic decomposition of the vapours of ordinary alcohol at about 350° I have been led to distinguish three kinds of catalysts:—

Dehydrogenating catalysts, resulting in the formation of aldehyde with the separation of hydrogen; these are the finely divided metals, and also, although much less active, manganese dioxide:

Dehydrating catalysts, producing ethylene with the elimination of water; these are alumina, thoria, and blue oxide of tungsten:

Mixed catalysts, yielding at the same time both products, but generally with one action predominating. Thus, chromium sesquioxide is especially a dehydrator, whilst zinc oxide is especially a dehydrogenator (it yields a gas containing 95% by volume of hydrogen and only 5% of ethylene).

14. We might suppose that these oxides which we have classed as dehydrogenators, oxide of manganese and oxide of zinc, could also be employed as hydrogenating catalysts, analogous to reduced copper, but much less active. Under similar experimental conditions working at 310° with ethyl alcohol, using similar volumes of catalysts, reduced copper liberated 110 c.c. of hydrogen per minute, zinc oxide 5.5, and manganese oxide 3.5. I have recently determined the hydrogenating capacity of manganese dioxide in relation to nitrobenzene, which only at temperatures exceeding 400° yielded aniline, which, under these conditions, was partially transformed into benzene and ammonia. The application of this oxide or of zinc oxide as a catalyst of only moderate activity would be useful in the hydrogenation of easily decomposed molecules if we could only compensate for their feeble activity by a sufficient increase of pressure in those reactions which result in a diminution of volume. A method of this nature was recently employed in the industrial synthesis of methyl alcohol starting from water-gas. When I had established, with M. Senderens, the remarkable activity which nickel, prepared by reducing the oxide, possesses at 180° as a catalyst to fill with hydrogen the vacant positions in organic molecules, we thought of applying this to carbonic oxide, a bivalent molecule, which can be completed by 1 atom of oxygen, 1 atom of sulphur, 2 atoms of chlorine. We hoped to obtain the following reaction:—

and it might be expected that the formaldehyde so produced would combine with an excess of hydrogen to yield methyl alcohol $H \cdot CH_2OH$. But the nickel catalyst, being too active, goes beyond this point and yields water and methane CH_4 . We thought the nickel might be replaced by reduced copper, a catalyst much less active, but this had no effect below 450° on a mixture of carbonic oxide and hydrogen at ordinary pressure, and at that time (1902) we had not tried the catalytic

action of the metallic oxides, the use of which as hydrogenators did not occur to us until later, when M. Mailhe and I had shown the dehydrogenating activity of several of them in conjunction with the primary and secondary alcohols (1910). The use of high temperatures at ordinary pressure would not give us the desired result, for at 100° methyl alcohol and its aldehyde are not stable in the presence of hydrogen, and decompose completely into carbonic oxide and hydrogen.* On the other hand, the use of high pressures, which stabilise the methyl alcohol and aldehyde, should solve this problem, and at the present time methyl alcohol is prepared by working with copper or with zinc oxide at 400—450° at a pressure of 150–250 atmospheres.

15. It has been known for a long time that the same catalysts can induce hydration reactions. Examples of this are numerous and even classical in organic chemistry, sulphuric acid with a greater or less addition of water being frequently employed for this purpose. If we leave in the cold an aqueous solution of acetic ether, the water causes a slow reaction, regenerating alcohol and free acetic acid, but this hydrating action is limited by the inverse reaction of esterification. At the end of two or three days the proportion of free acid, easily determined by titration, hardly exceeds 1%; the limit would not be reached until after several years. If to such a solution we add a few cubic centimetres of sulphuric acid, the hydration of the ether becomes very rapid; less than a day suffices to reach the limit. On the other hand if we mix equal molecules of alcohol and acetic acid and distil the homogeneous liquid thus obtained, we find that the proportion of acetic ether formed does not exceed 1%. If we add to this liquid a few per cent. of concentrated sulphuric acid, acetic ether is produced with extreme rapidity. This is another instance of a temporary compound formed and decomposed very rapidly, ethyl hydrogen sulphate. It is useful to consider this in these two inverse cases as being the cause of the catalysis. These reactions do not alter the number of molecules, and the heat yielded or absorbed being unimportant, we should expect that the pressure would be without influence on the limit, and that variation of temperature would only modify this very slightly. This is in accordance with what has been found by experience.

16. Solid dehydrating catalysts such as alumina and thoria can also reverse their functions and be employed as hydrating catalysts. Thus, thoria acting on phenol at about 450° converts this into phenyl oxide with separation of water; but I have shown that the vapours of phenyl oxide mixed with water vapour and led over thoria at 450° is partially reconverted into phenol. The dehydrating activity of alumina or of thoria in respect of the aliphatic alcohols is used in practice to transform these into ethylenic hydrocarbons:

This reaction is strictly endothermic. In the conversion of ordinary alcohol into ethylene it absorbs about 17 Calories. It has been supposed to be a complete transformation, but in fact it appears from a number of experiments made in my laboratory by one of my pupils.

* P. Sabatier et Senderous, *Ann. Chim. Phys.*, (8), 4, 463, 1905.

M. Marecek, that it is limited to a small extent by the inverse reaction in which the hydrocarbon is hydrated. This latter reaction, which causes a reduction of the gaseous volume by one half, ought to be assisted by an increase of pressure, and it appears probable that under higher pressures the direct hydrogenation of ethylenic hydrocarbons by water vapour in the presence of alumina or of thoria should enable these to be converted into alcohols in the same way that sulphuric acid of a suitable strength enables this to be done in a liquid medium.

The use of high pressures, which is already a current procedure in laboratories and in the heavy chemical industry, and has enabled us to effect so well the catalytic synthesis of ammonia, enables us, by stabilising the molecules which result from a condensation reaction to utilise, in a useful manner, the reversible activity of various catalysts.

CANADIAN NOTES

Platinum Metals.—The metals of the platinum group were produced in 1926 only in the provinces of British Columbia and Ontario. Canada, however, stands third in the world's production, larger amounts coming from Russia and Colombia. In British Columbia small quantities are found in placer deposits with alluvial gold and black sands; in Ontario these rare metals occur with the nickel-copper-sulphide ores of the Sudbury district. Copper-nickel matte containing the precious metals is made at Coniston by the Mond Nickel Company and at Copper Cliff by the International Nickel Company. The Mond matte is shipped to Clydach, Wales, for refining. International matte is shipped either to the United States, for the manufacture into Monel metal, or to Port Colborne, Ontario, for refining. When the copper and nickel are removed, the residues are further refined for the recovery of gold, silver, platinum, and palladium with smaller amounts of rhodium and iridium. The Canadian production of platinum metals in 1925 and 1926 is as follows:—

	1925		1926	
	Platinum	Palladium, Rhodium, etc.	Platinum	Palladium, Rhodium, etc.
Produced by Canadian, United States and British Refractories from Canadian mattes and residues				
Fine oz	8,692	8	9,471	10,024
Value \$	1,027,477	648	919,349	640,178
British Columbia placers				
Fine oz	6	—	50	—
Value \$	715	—	4,258	—
Total				
Fine oz	8,698	8,288	9,521	10,024
Value \$	1,028,192	648,969	923,607	640,178

Antimony.—1,596 lb. valued at \$281 was reported as being contained in lead-silver-bismuth bullion exported from south Ontario smelters. The Consolidated Mining and Smelting Company of Trail, B.C., have made arrangements for the collection of antimony as a by-product from their refinery, but no production was reported by that company in 1926.

Bismuth.—This metal occurs in the silver-cobalt ores in small quantities, and in their treatment it is allowed to build up in the lead and silver bullion until it reaches a marketable percentage. Shipments amounted to 6440 lb. valued at \$6440.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, will be available about the middle of August. The reprints will be in Journal format, with paper cover, and the price will be 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent at once to the General Secretary at the Society's Offices, Central House, Finsbury Square, London E.C.2

CHEMICAL SOCIETY'S LIBRARY

The Library of the Chemical Society is closed for stocktaking from Monday, August 1, until Saturday, August 13, inclusive, and will close each evening at 5 o'clock from August 15 to September 10

CALENDAR OF FORTHCOMING EVENTS

Aug. 20. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, Newcastle-upon-Tyne. Annual Meeting at 2.30 p.m.

Sept. 6 to 9. INSTITUTE OF METALS. Autumn Meeting to be held at Derby. On September 6, at 8 p.m., the Sixth Autumn Lecture on "Non-ferrous metals in modern transport," will be delivered by Dr. L. Aitchison, in the Municipal Technical College. On September 7, a general meeting of members will be held at 10 a.m., and in the afternoon, at 2.30 p.m., visits will be paid to the Carriage and Wagon or Locomotive Works of the London, Midland and Scottish Railway Company, or Derby Crown China Works. On September 8, at 2.30 p.m., visits will be paid to the works of Messrs. Rolls-Royce, Ltd., or Messrs. Leys Malleable Castings, Ltd., or to Messrs. W. Benrose & Sons, Ltd. (printing works). During the meeting the following papers will be read at the different sessions: "Copper-magnesium alloys. Part II," by W. T. Cook and W. R. D. Jones; "Researches on intermetallic compounds. VI. The reaction between solid magnesium and liquid tin," by W. Hume-Rothery. "Age-hardening tests with elektron alloys," by K. L. Meissner. "Equilibrium diagram of copper-tin alloys containing from 10 to 25% of tin," by A. R. Raper. "Note on cathodic disintegration as a method of etching specimens for metallography," by C. S. Smith. "Protection of aluminium and its alloys against corrosion," by H. Sutton and A. J. Sidery. "Nature of the film produced by anodic oxidation of aluminium," by H. Sutton and J. W. W. Willstrop. "Grain growth in compressed metal powder," by C. J. Smithells, W. R. Pitkin and J. W. Avery. "The undercooling of some aluminium alloys," by Marie L. V. Gayler. "Constitution of alloys of aluminium with silicon and iron," by A. G. C. Gwyer and H. W. L. Phillips. "Effect of work and annealing on the lead-tin eutectic," by F. Hargreaves. "The system magnesium-cadmium," by W. Hume-Rothery and S. W. Rowell. "Constitution and physical properties of some of the alloys of copper, zinc and cadmium," by C. H. M. Jenkins.

PERSONAL AND OTHER ITEMS

Sir Josiah Stamp has been elected to succeed Sir Guy Granet as chairman of the London, Midland & Scottish Railway.

On the occasion of the meeting of the British Association in Leeds, the University of Leeds will confer the honorary degree of D.Sc. upon Dr. J. S. Haldane, Dr. N. V. Sidgwick, Dr. F. O. Bower, and Prof. R. A. Millikan (California Institute of Technology, Pasadena).

Mr. G. E. O'Riordan, principal of the Leicester College of Technology since 1924, has been appointed principal of the Battersea Polytechnic in succession to Dr. R. H. Pickard, F.R.S., now Director of Research for the British Cotton Industry Research Association.

The President of the Board of Trade has appointed Mr. A. E. Faulkner, C.B., C.B.E., director of sea transport, to succeed Sir Ernest Gowers, K.B.E., C.B., as acting Permanent Under-Secretary for Mines. Mr. E. J. Foley, C.B., Assistant Under-Secretary for Mines, succeeds Mr. Faulkner as director of sea transport.

Mr. I. E. Emerson, chairman of the board of the Emerson Drug Company, has given the University of Maryland two fellowships, one in support of a professorship in biological testing, yielding \$1,000 annually, and the other, yielding \$1,500, to maintain a fellow in pharmacology in the School of Medicine.

The following awards for the year 1927-28 have been made by the Salters' Institute of Industrial Chemistry and approved by the Court of the Company:—

Fellowships have been renewed to: Mr. R. M. Downes, University of Oxford, at the Ramsay Department of Chemical Engineering, University College London (Fellow, 1926-27); Mr. H. B. Spalding, University of Oxford, at the Massachusetts Institute of Technology (Fellow, 1926-27).

Fellowships have also been awarded to: Mr. C. G. Akhurst, Imperial College of Science and Technology, London; Mr. A. Caress, University of Cambridge; Mr. I. G. Nixon, University of Cambridge; Mr. D. R. Pryde, University College, Bangor; Mr. J. Muir Smith, Armstrong College, Newcastle, and Mr. F. Witt, Imperial College of Science and Technology, London.

The Salters' Institute has also awarded fifty Grants-in-Aid to young men employed in chemical works to facilitate their further studies.

Dr. H. P. Talbot, Dean of the Massachusetts Institute of Technology, and one of the leading chemists in the United States, has died, aged 63.

The death is announced of Prof. C. F. Mabery, aged 77, a noted American authority on the chemistry of petroleum. His first work related to the constitution and derivatives of furfural, and he was associated, in the early days of electric smelting, with the Cowles brothers in developing their internally-heated electric furnace. In 1883 he became professor at the Case School of Applied Science, Cleveland, and since then his work related mainly to organic oils, lubrication and related subjects.

The late Mr. C. S. L. Petri, founder of the International Paint & Composition Co., Ltd., left £74,070.

Mr. W. C. Teagle, president of the Standard Oil Co. of New Jersey, is now in Germany, where he is negotiating with the Interessens Gemeinschaft in respect of its synthetic motor fuel.

The death is announced of Mr. R. Mason, J.P., deputy chairman of the Tynemouth Gas Co., and vice chairman of Langdale's Chemical Manure Co.

The following deaths are announced from Germany — Paul Fiedler, director of the Bleiindustrie A.G., W. Hill, director of the Gummiwarenfabrik S. Herz G.m.b.H., Prof. P. Oberhoffer, professor of ferrous metallurgy at Aachen.

Institution of Chemical Engineers—Recent Elections

Members

Stanley Robson, M.Sc., A.I.C., D.I.C., General Works Superintendent, National Smelting Co., Ltd., Avonmouth.
Alexander Sanders, A.I.C., Assistant Works Manager, National Smelting Co., Ltd., Avonmouth.
George Gerard Wilson, Engineer and General Manager, Whitwood Chemical Co., Ltd., Normanton.
Thomas Alexander Wilson, F.I.C., Chief Research Chemist, Glasgow Corporation Chemical Works.
Rowland Walker, Manager, Gaythorn Gas Works, Manchester.
Edward Escott Wood, General Works Manager, Brymbo Steel Co., Ltd., Brymbo; President, Coke Oven Managers' Association.

Associate-Members

Robert Edgeworth-Johnstone, B.Sc.Tech., A.I.C., Chief Chemist, "C.C." Processes, Ltd., London.
Richard Burt Robinson, B.A., Deputy General Works Manager of the Midland Tar Distillers, Ltd., Birmingham.
Charles Clitstone Smith, B.Sc., Superintendent, Gas Light & Coke Co.'s Tar Works, Southall.

Transfer from Graduateship to Associate-Membership

Dennis Morten, A.R.C.Sc., A.I.C., Chemical Engineer to H.M. Factory, Sutton Oak.
James Russell Ferguson, Works Chemist, Glasgow Corporation.

Graduates

Charles Danvers Power, Student at the Imperial College of Science and Technology, London.
John Myles, B.Sc., Student at the Imperial College of Science and Technology, London.
Robert Alfred Victor Tavar, A.I.C., Research Chemist, John E. Sturge, Ltd., Birmingham.

Students

Harold Morris, Chemist-in-Charge, J. L. Rose, Ltd., Barking.
Stuart Douglas Newall, Assistant with Ruston & Hornsby, Ltd., Lincoln.

Low Temperature Fuel

It is announced that Low Temperature Carbonisation has completed its first production of solid smokeless fuel, "Coalite," from its new works at Barnsley, and has sold its first parcel of 500 tons at a price 50% above that of best domestic house coal. It is further stated that the fuel oil produced by the company's process is of exceptional quality and is selling at double the price previously obtained for this commodity.

British Association Meeting at Leeds

Amongst the papers to be read in September at the Leeds meeting of the British Association are the following:—In the discussion on coal Prof. J. W. Cobb will discuss "Our available coal supplies and their utilisation," and Prof. R. V. Wheeler will deal with "The

chemistry of coal." Prof. R. A. Millikan will give an evening discourse on "Cosmic rays." There will be several big discussions, including a series on textiles.

International Congress of Photography

The seventh International Congress of Photography will be held in London in 1928, under the auspices of the Royal Photographic Society. The last meeting was held two years ago in Paris.

Sulphuric Acid in Canada

It is announced that the Consolidated Mining and Smelting Company of Canada will proceed immediately with the erection of a large contact-process sulphuric acid plant. This plant will make sulphuric acid from the smelter fumes, and the first unit will cost approximately \$250,000. In conjunction with this plant an experimental phosphate fertiliser plant will be erected, using phosphate from the fields in the Crows Nest district, where the Consolidated Co. has located large beds.

Platinum in Quebec

According to advices received in London, tests of ore in the Rouyn (Quebec) mining field have uncovered a rich deposit of platinum. The following assay was quoted:—Copper ranging from 3 to 21 per cent., gold from 80 cents. to \$199.5 per ton, platinum from \$290 to \$2,100 per ton. Unfortunately, when ore of such richness is discovered, it is generally in comparatively small lots.

Food Colours in the U.S.A.

The coal-tar dyes which are accepted for certification in the United States, subject to the Food Inspection Decisions (76, 77, 106, 129, 159), are as follows:—

Red shades: Ponceau 3R (80). Amaranth (184). Erythrosine (773).

Orange shade: Orange I (150).

Yellow shades: Naphthol yellow S (10). Tartrazine (640). Yellow AB (22). Yellow OB (61).

Green shades: Guinea green B (666). Light green SF yellowish (670). Fast Green FCF (*p*-hydroxy derivative of the sodium salt of alphaniline FG, 671).

The numbers following the names refer to the index numbers given in the Colour Index of the Society of Dyers and Colourists.

Nitric Acid from Ammonia

In a recent article (*Ind. & Eng. Chem.*, July, 1927), Dr. C. L. Parsons points out that nitric acid produced by the oxidation of ammonia can now be made in any concentration, and, including fixed charges on plant, for at least \$30 per ton less than it can be made from Chilean nitrate, even when this is charged on the basis of 2 c. per lb. Nitrogen in the form of ammonia, says Dr. Parsons, is now obtainable for less than half the price of nitrogen in Chilean nitrate. This, with the development of chrome-steel alloys for tower construction, increased efficiency of operation, operation at higher temperatures, the general improvement of plant and automatic controls, and other developments, suggests that the ammonia-oxidation process is likely to prevail in the near future.

Chilean Nitrate Law

A law aiming at the development and protection of the nitrate industry has come into operation in Chile. The law creates a control service similar to the U.S. Bureau of Mines and empowers the President of the Republic to exploit the best nitrate reserves if producers refuse to restart their plants. It also empowers the President to reduce or increase the export tariff without the previous authorisation of Parliament if modification is deemed advisable. The law provides for loans to producers desirous of developing their plants or establishing stocks abroad for the purpose of selling direct to consumers. The Government can also adopt measures for reducing transport costs of nitrate and securing the lowest prices for fuel and other materials required for operating nitrate plants. According to the *Financial Times*, the effect of the law is already being felt, as the number of plants operating has increased to 35, and production and exports have risen, whilst the price has fallen, although the export tax remains unaltered.

The German Dye Trust

It is believed that the I. G. is negotiating with Russia for the establishment in that country of an artificial silk factory, which would have the patents and technical assistance of the I. G. in return for a share of the profits.

An agreement has been made between the Vereinigte Glanzstoff Fabriken and the Kodak Co. for the manufacture of sensitised materials for the European market.

Speaking at the annual meeting of the A.G. für Industrie, u. Technik, the chairman of the board, Herr Bruckmann, said the value of the I. G. was not to be judged by its 10% dividend. Its programme for the introduction of new technical processes was far from being completed. Now that the coal-liquefaction process had been shown to be economically sound, the I. G. would be able, at the beginning of 1928, to supply half the German requirements in motor fuel, and later would probably be able to export. New projects were continually under study and pleasant surprises could be expected in the future.

Apparently, the I. G. is going to use aerial transport, as it has made an agreement with the German aviation company, the Luft Hansa A.G., for reduced charges for the transport of a certain quantity of goods.

The German Steel Trust

The total property of the Vereinigte Stahlwerke A. G. (the German Steel Trust), including coal reserves, is assessed at over \$500,000,000. The Trust controls 31 cokeries, with a total yearly output capacity of over 9,500,000 metric tons of pig iron, 27 steel works with a yearly production of over 8,000,000 metric tons, in addition to rolling mills, foundries, and other finishing plant with a yearly output of over 7,100,000 metric tons. The coal reserves of the Steel Trust are computed at approximately 5,000,000,000 metric tons production capacity, and the mines at present being worked have a yearly output of over 30,000,000 metric tons.

Nitrogen Fixation in France

The State nitrogen-fixation factory which has been erected at Toulouse is now producing 40 metric tons of ammonium sulphate daily from the first of the six producing units which are to be installed. The capacity

of the works will eventually be 500 m.t. a day. At present the factory, which is controlled by the "Office national industriel de l'Azote (O.N.I.A.)," employs 30 engineers and 1500 to 2000 workmen.

Nitrogen Fixation in Poland

In Poland, the fixed nitrogen industry dates from 1922, when the factory built by the German Empire at Chorzow was taken over. Good results have been obtained at this factory, which uses the Bayerische Stickstoffwerke patents, and more attention is being paid to the utilisation of the by-products, such as oxygen. A new cyanamide factory is now to be built at Radon, also in Upper Silesia, with the help of American capital, but the Bayerische Stickstoffwerke patents are apparently not to be used. The new factory will be ready in 1930.

Nitrogen Fixation in Russia

The Stockholms Superfosfatakt., a Swedish company, is to erect a cyanamide works in Russia, with an annual capacity of 30,000 tons.

The Leucite Industry in Italy

Last year, the Società Italiana Potassa, which treats leucite by the Blanc process at Roccamonfina, near Naples, produced an average of 1,500 metric tons monthly of concentrated leucite. A new factory with a monthly output of 6,000 t. is under consideration. Three-quarters of the present production of leucite is utilised for the extraction of aluminium and potash salts; part is exported to France and England; and the remainder is sold in Italy as a fertiliser. Last year the Società made an agreement with the Società Italiana d'Elettrotecnica for the erection at Russi of a factory to treat 400 t. of leucite a month, and produce 80 t. aluminium chloride and 140 t. potassium chloride (largely for conversion into chlorate). At present, work at this factory is suspended owing to a disagreement. Two other works treat the Blanc leucites, and a group, in which French capital is interested, proposes to erect a factory at Naples to treat 150,000 t. of leucite annually and make potassium chloride, and alumina, which would be utilised for the manufacture of aluminium in the north of Italy. In addition, Peter Spence & Co., in Manchester, England, and the Société d'Electrochimie et Electrometallurgie, Lyons, France, are reported to use the Blanc process. The residual silica from the process is used in Italy chiefly for the manufacture of sodium silicate.—(*Ind. Chim.*, July, 1927.)

Third Census of Production (Abrasives)

The following statement gives particulars of the output in Great Britain in the year 1924 of abrasives produced by factories and workshops making returns on schedules for this trade:

Product	Quantity Reams of 480 sheets	Selling Value £
Manufactured abrasives:		
Emery cloth	152,000	301,000
Glass and sand paper	228,000	202,000
Other abrasives, cloths and paper:		
Quantity stated	4,000	11,000

REVIEWS

I.—PROCEEDINGS OF THE OPTICAL CONVENTION, 1926. Part I, pp. ix + 491; Part II, pp. vii + 493–1051. London: Optical Convention, 1926. Price £3 net.

II.—CATALOGUE OF OPTICAL AND GENERAL SCIENTIFIC INSTRUMENTS. Pp. x + 326. London: Optical Convention, 1926. Price 6s. net.

I.—Science is measurement, and the development of science keeps step with the development of measuring-instruments. That this is true of the development of chemistry is clear. Think of the advances in so-called pure chemistry attributable to the introduction of the spectrometer. What of the advances in applied chemistry associated with scientific instruments? Did not our Prime Minister tell us at the opening meeting of the Optical Convention that for our supplies of good ale we are entirely in the hands of the polarimeter and microscope? *Et hujus generis omnia*, so far as chemical products are concerned.

The optical industry of the world is based very largely upon the pioneering work of British scientists and inventors. "Nature and nature's laws were wrapped in night. God said, 'Let Newton be,' and all was light."

It is well, therefore, that the Proceedings of the third Optical Convention held in London in 1926, containing the full text of the Presidential Address and of the papers, numbering nearly 100, read at the Convention, show that British scientists have not lagged in their development of optical theory and the design of optical instruments since the previous Optical Convention held in 1912. These two handsome profusely-illustrated quarto volumes are something infinitely better than any record of scientific achievement with which we are familiar outside the realms of the publications of the learned societies. The primary purpose of the Convention was, we presume, to impress upon the world that the British optical trade is capable of supplying the whole of the optical requirements of the world. These two volumes definitely establish that fact. Here is a record of great achievements by British scientists and firms during the war and post-war period in the manufacture of optical glass and optical elements, the design of optical instruments, colour, photometry and illumination, astronomy, cinematography, etc. Every paper is authoritative, and in most cases very readable. The volumes are well indexed, and the price is reasonable.

II.—The Catalogue of optical and general scientific instruments is useful as an indication of the newer types of optical instruments of British origin placed upon the market since 1912. It should be in the hands of all who are potential purchasers of optical instruments. The value of the catalogue would have been increased if some indications were given of the approximate prices of the various instruments described. Optical instruments are generally regarded as being rather expensive luxuries. Possibly on account of the prevalence of this notion, the use of such instruments in British chemical technology is much less extensive than it should be. Thus, the interferometer might be usefully employed in a number of operations in which the composition of a gas or liquid is to be ascertained. We are

not familiar with any such application of the instrument in this country. It is used in Germany for, *inter alia*, the rapid determination of the composition of flue gases. The misconceptions referred to can be best removed by a familiarity with optical instruments, so to speak, in the flesh. Alternatively, let the volumes published by the Optical Convention be found upon the shelves of all the chemical manufacturing firms of the country.

J. S. G. THOMAS

INORGANIC CHEMICAL SYNONYMS AND OTHER USEFUL CHEMICAL DATA. By E. R. DARLING. Second, revised and enlarged edition. Pp. vii + 119. New York: D. van Nostrand Co., 1922. Price \$1.00.

No one will dispute the utility of a dictionary of chemical synonyms, even though it makes no pretension to completeness. In addition to lists of synonyms, this book contains various scraps of information, such as "*monine* is the French word for monk," "a peculiar feature of chromium is its valency, which is divalent, tetravalent, and hexavalent." Prof. Darling also declares that ferric iron has a valency of four, and elsewhere he has similar views regarding cobalt and nickel. "Argonite" and "calspar" are calcium carbonate. "verdigris" is basic copper acetate: "Candy's liquid," "kieserite" and other old friends have new faces. The reviewer, in fact, began to make a list of errata which might charitably be considered typographical, but he tired of the task. A. A. E.

ESSENTIALS OF VOLUMETRIC ANALYSIS. AN INTRODUCTION TO THE SUBJECT, ADAPTED TO THE NEEDS OF PHARMACEUTICAL CHEMISTRY. By HENRY W. SCHIMPF, Ph.G., M.D. Fourth edition, revised and enlarged by Alfred L. Cone, Ph.D., Ph.G. Pp. xiv + 370. New York: John Wiley & Sons, Inc.; London: Chapman and Hall, Ltd., 1926. Price 15s.

Both in this country and America the chemical education of the pharmacist is reaching a higher level to-day than ever before. This fact is marked here by the establishment of central schools of instruction, the requirement of a higher standard of attainment at the examinations of the Pharmaceutical Society, and the institution of degrees in pharmacy by several of our Universities. The appearance of a book such as that under review, which is ostensibly adapted to the needs of students of pharmaceutical chemistry, is a sign of the times.

The book is divided into three parts. Part I deals with general principles, apparatus, indicators, calculation of results, and analysis by neutralisation, precipitation, oxidation, indirect oxidation, and iodimetry. Part II describes processes of special interest to the pharmacist, such as the estimation of alkaloids, fats, formaldehyde, and alcohol; whilst in Part III there are various exercises with the nitrometer. Finally, there is a useful appendix containing the description of various indicators, and an exposition of the principles underlying the γ_H determination, and the use of buffer solutions.

There are slight misprints in equations on pp. 106 and 127. Burettes with rubber tube and pinch-cock

are described as the simplest and most common form (p. 29). It is to be hoped the latter statement is not now true. Phenolphthalein (p. 27) is said to be useless as an indicator in presence of ammonia and its salts, yet its use is recommended in the estimation of ammonium carbonate; the titration of borax (p. 79) with N-acid and methyl orange as indicator estimates only Na_2O . On p. 180, O_3 is made to stand for three atoms of nascent oxygen, and in other places the following formulæ appear: Hg_2 , C_2 , Cl_3 , I_4 , Cl_6 , Br_6 .

Notwithstanding these blemishes, the book is valuable, and may be recommended for use in schools of pharmacy.

R. M. C.

PROJEKTIERUNGEN UND APPARATUREN FÜR DIE CHEMISCHE INDUSTRIE. I. GRUPPE: NITROCELLULOSE, SYNTHETISCHER CAMPHER, PULVER. By J. L. CARL ECKELT und DR. OTTO GASSNER. Pp. 156. Leipzig: Otto Späner, 1926. Price: paper, 15 r.m.; bound, 18 r.m.

In the preface the authors state that the purely chemical and theoretical foundations of the processes under consideration are sufficiently dealt with in the literature. They therefore deal with the subject more from the constructional and engineering aspects. The book is not an exhaustive description of the various constructional and engineering methods, or even of the different types of plant in use. It apparently describes the type of plant employed in one German factory, but gives no indication of alternative processes used for similar purposes in other countries, or even in other German factories.

Apart from these reservations, however, the volume gives an excellent idea of the processes involved and the plant employed in the various manufactures described.

The first section deals with the plant for the manufacture of nitrocellulose, including the preparation of the cotton. A very good practical description is given of the design of the various parts of the plant, including the volumes and working pressures. The manufacture of campher is dealt with in a similar manner in the second section. A very complete description is given in the third section of the various machines used in the manufacture of nitrocellulose powder. Here, again, full information is given regarding weight, volume, and working pressure of each item of plant.

As an appendix to the chapter on nitrocellulose, a description is given of the Torkret cement-spraying process in connexion with the construction of hollowers of reinforced concrete. The authors write enthusiastically on this method of construction.

Particular interest attaches to the pages on solvent handling at the end of the third section of the book, and while there is nothing special in the apparatus described for other manufacture, the descriptive matter as regards the recovery of volatile solvent by cresol and reactive charcoal is very well presented.

A large number of excellent photographs and drawings is given throughout the book.

Apart from the reservations given above, the book appears to be an excellent one for students of chemical engineering.

J. W. McD.

PARLIAMENTARY NEWS

Duty-Free Spirit (Conveyance)

Replying to Mr. Clayton, Mr. McNeill said that the Finance Bill would make it possible to allow, under suitable Regulations, conveyance by tank wagon or pipe-line in the case of methylated spirits, but not in the case of spirits which, though denatured, were not methylated. -July 26.

Fuel Research Board (Expenditure)

In answer to Mr. C. Edwards, the Parliamentary Secretary to the Board of Education (Duchess of Atholl), said that the net amounts included in the estimates of the Department of Scientific and Industrial Research for fuel research and the net amounts annually expended were as follows, the amounts actually expended being given in brackets:—1922–23, £45,779 (£46,772); 1923–24, £32,540 (£42,751); 1924–25, £43,191 (£48,142); 1925–26, £61,536 (£76,147); 1926–27, £91,863 (£88,350). The figures showed that the increase in expenditure considerably exceeded the £30,000 authorised by the late Government. The cost of additional accommodation made necessary by the extension of the work had been borne on the Office of Works' Vote, and was not included in these figures. -July 27.

Safeguarding of Industries

The Parliamentary Secretary to the Board of Trade (Sir Burton Chadwick), in reply to Dr. Vernon Davies, said that up to the present 14 applications under the Safeguarding of Industries procedure had been received by the Board of Trade. Fifteen of these had been referred to Committees for enquiry, and seven duties had been imposed. Of the remaining 29 applications, three had been withdrawn or were in abeyance, 22 had been rejected without reference to a Committee, and four were pending. -July 27.

Sugar-Beet Pulp

In reply to Major Braithwaite, Mr. Guinness said that under their current contracts with the factory companies, the growers had the option of purchasing from the factory dried beet pulp of an amount equal in weight to 5% of the total net weight of beets delivered by them, at the price of £5 per ton ex factory, provided the option was exercised, in writing, before August 1, and the grower undertook to use upon his own farm the dried beet pulp so purchased. He was informed that growers had not taken full advantage of this facility in the past and that, in fact, less than one-quarter of the dried pulp to which growers were entitled last year was purchased by them. The two large groups of factories had this year undertaken an extensive propaganda, through the Press and otherwise, to bring to the attention of farmers the importance of sugar-beet pulp as a food for stock, and he understood that satisfactory results had followed this publicity.—July 27.

Insulin Treatment

In a written answer to Mr. Forrest, Mr. Chamberlain stated that insulin was not a curative agent in the ordinary sense of that term. It was administered with the object of neutralising for the time being the consequences of the disease, although in certain cases its prolonged administration might be followed by a diminution in,

or even the entire disappearance of, the active symptoms. Statistics as to the number of persons treated were not available, nor was it possible to ascertain the number of cases in which insulin treatment had contributed to the cure of the disease. — July 28.

Cocaine and Cocaine Hydrochloride

Sir P. Cunliffe-Lister informed Mr. Fenby that before he could make any recommendation to the Treasury under Section 10 (5) of the Finance Act, 1926, to exempt the above articles from duty, he must be satisfied that there was no reasonable probability that the article would be made in H.M. Dominions in substantial quantities within a reasonable period. Preparations for the manufacture of cocaine and cocaine hydrochloride in this country were well advanced, and he did not propose to make any recommendations to the Treasury on the subject at present. — July 29.

Potato Flour

Replying to Commander Bellairs, Sir P. Cunliffe-Lister said that the quantity of potato flour produced in the United Kingdom could not be stated separately from that of dextrine produced. For these two commodities the output in Great Britain in 1924 for sale amounted to 39,000 cwt., and in that year the imports into Great Britain and Northern Ireland from the Netherlands of these two products amounted together to 493,000 cwt. The output of potato flour in the Netherlands in 1922–23 was about 3,000,000 cwt., the amount being exceptionally high owing to the abundant crop of potatoes in 1922. Figures for later years were not available. — July 29.

Salt Output of India

In a written reply to Mr. Kelly, Earl Winterton stated that the Government output of salt in India in 1922–23 was 19,089,677 maunds (one maund equals 82½ lb.), in 1923–24, 20,349,338 maunds, and in 1924–25, 17,097,505 maunds. During the same years the total production of salt in British India was 39,972,698 m., 42,124,412 m., and 38,141,715 m., respectively, and for the same periods the total receipts from sales of Government salt amounted to 47,85,649 rupees, 68,92,249 rupees, and 40,56,358 rupees, respectively. Figures for the last two years were not yet available. — July 29.

Adjournment

The House adjourned on July 29 until Tuesday, November 8, 1927.

COMPANY NEWS

NATIONAL SMELTING CO., LTD.

The ninth annual ordinary general meeting was held on July 28, the Rt. Hon. Sir Robert Horne, G.B.E., K.C., M.P. (chairman) presiding. After reviewing the accounts (cf. *Chem. and Ind.*, July 29, 1927, p. 694), the chairman said that as the company dealt in commodities which fluctuated largely in price, they had to be conservative in the administration of their resources. Another reason was that they had nearly £2,000,000 invested in plant and property in this country which represented the capital employed in plants connected with the blende-roasting and the production of sulphuric acid and spelter. Whilst the great roasting and acid

sections of their equipment might be regarded as up-to-date, and in their character more or less permanent, it was fairly certain that metallurgical developments would soon necessitate substantial changes in the methods of producing spelter if it was to be a continuing industry in the United Kingdom. This would mean large expenditure on new plant. The company's main programme for new equipment, involving an expenditure during the past four years of upwards of £500,000, was completed during the year. The works at Avonmouth and Swansea Vale were equipped with mechanical blende-roasting furnaces and sintering machines, and in both cases mechanical handling and special storage arrangements had been installed. Also, at Swansea Vale, a new acid plant had been set up, and two extra units of the Avonmouth plant had been brought into operation. The supply of zinc ores and concentrates had shown a great expansion, and in place of the scarcity of a year or two ago, there was now an over-supply of no inconsiderable proportions. The consequence had been a substantial rise in the returning charges quoted by Continental smelters. On the other hand, the price of the metal had fallen substantially, to-day's price being £5 7s. 6d. below that ruling at this date a year ago, and £5 2s. 8d. less than the average for the whole of 1926. The company's chief supply of raw material in the past had been derived from the contract with the British Government for Australian concentrates. This contract expired in June, 1930, but through arrangements made and the stocks which the company were now in a position to accommodate they should be able to meet all their needs until 1933 at least. In conclusion, the chairman said the outlook was favourable. He did not expect that the current year's returns would reach the high level of last year, but so far the works had given good results and the investment revenue was satisfactory.

TANGANYIKA CONCESSIONS, LTD.

The ordinary general meeting, held on June 28, was presided over by the chairman, General Sir Francis R. Wingate, Bt., who said that the year under review had proved to be one of exceptional activity, especially as regards the rapid progress of the Benguela Railway, which should reach the Congo frontier by the end of the current year. Notwithstanding a smaller copper production and a lower level of market prices for the metal, the profits of the Union Minière were higher than in 1925. Apart from copper, about 662 tons of tin and 300 tons of cobalt were produced and marketed at satisfactory prices, together with about 20 grammes of radium extracted from the company's uranium ore. The direct leaching process now being installed would lessen the cost of production. It required much less labour, no fluxes, used the water power of the country instead of imported coke, and only needed a comparatively small amount of imported sulphur, whilst it obtained the maximum extraction of copper from the ore. The new large reverberatories at Panda were expected to be at work before the end of this year, and would be capable of yielding some 30,000 to 40,000 tons of bar copper annually. The first unit of the electrolytic leaching plant, of 30,000 tons capacity, was also progressing, and was expected to be ready for operation in 1929, together

with other additions to the treatment and power plant and mine equipment. When these new plants were running, the copper production would be about 140,000 tons per annum. The completion of the Benguela Railway connexion, in two or three years' time, would enable the Western mines to be worked and the yearly production of copper steadily increased. It was satisfactory to note from the Union Minière report that the proved reserves of copper, which amounted to over 5,000,000 tons, again showed an increase over the figures of the previous year, in spite of the large extraction during the year. The Tanganyika Concessions, in conjunction with the Zambesia Exploring Company, had taken a joint interest with the British Metal Corporation and the Zinc Corporation in the recently formed British (Non-Ferrous) Mining Corporation, whose objects were the investigation and development of promising base metals propositions.

[For the accounts, cf. *Chem. and Ind.*, July 29, 1927, p. 694.]

JURGENS, LTD.

A dividend has been announced for the half-year ended June 30, 1927, on (guaranteed) 7% cumulative participating preference shares at 7% per annum, payable on July 30, under deduction of tax at 4s. in the £.

INVERESK PAPER CO., LTD.

At an extraordinary general meeting of the Inveresk Paper Co., Ltd., held on July 29, resolutions were passed increasing the capital of the company to £2,200,000 by the creation of 1,000,000 additional shares, 600,000 of which will be 6½% "B" cumulative preference shares and 400,000 ordinary shares. The whole of the 600,000 cumulative "B" preference shares and 120,000 of the ordinary shares have been earmarked for issue to the holders of the 8% cumulative participating preference shares of the International Pulp and Chemical Company, Ltd., in accordance with the offer recently made to them for the purchase of their interests. The meeting directed that the balance of the ordinary shares be issued by the directors as and when and on such terms as they should think fit.

CELANESE CORPORATION OF AMERICA

According to the *Financial Times*, the directors of the American Celluloid Company, probably the largest producer of celluloid in America, have approved a re-organisation scheme for submission to the shareholders by which control of the company will be taken by the Celanese Corporation. According to the scheme, the Celluloid Company will erect a plant with an initial capacity of 5 tons of cellulose acetate daily and will increase its capital (\$10,000,000) by \$3,500,000, of which the Celanese Corporation will supply \$1,000,000. The new board of the company will comprise seven representatives of the Celanese Corporation (including Drs. C. and H. Dreyfus) and five representatives of the Celluloid Company.

BRITISH SUGAR MANUFACTURERS, LTD.

The loss for the year ended March 31, 1927, was £8,015, to which must be added loan and debenture interest for period, £14,227, and depreciation amounting to £22,559, making £44,831 to be added to debit balance brought forward of £39,040, making a total deficit of £83,872.

These unsatisfactory results were partly due to constructional work being in progress during the production period, to the heavy cost of coal, and two breakdowns in the boiler-house for about ten days, in addition to the unexpected short supply of beetroot. A sufficient acreage has been contracted for for the current season, to ensure a full supply, and alterations at the factory necessary for increased output will be completed in ample time for the coming season.

ENGLISH VELVET AND CORD DYERS ASSOCIATION

An interim dividend has been declared at the rate of 4% per annum on the ordinary shares.

FRANÇOIS CEMENTATION CO., LTD.

The seventh ordinary annual general meeting was held on July 22, Mr. H. Clayton (chairman) presiding. The net profit was £12,072, and after allowing for the payment of the preference dividend and adding the balance brought forward, there was an available sum of £29,915. After transferring £6,535 to reserve, and paying a dividend on the ordinary shares of 6d. per share, free of income tax, the balance of £10,880 was carried forward. During the year the company took up further patents, including a process for grouting with asphalt, and had taken an interest in Asbestos Cement Pipes, Ltd., a syndicate formed to deal with pipes made from asbestos and cement in accordance with the "Eternit" patents. The company had proceeded with the development work on the Betonac hardening material, which, considering the adverse circumstances of the coal stoppage, had done very well. The special qualities of this material were its resistance to wear and its impermeability to water, oils and other liquids, its freedom from dust and its durability and adaptability. The experimental areas of Betonac previously laid, whether for floors or roads, had successfully stood the test of trial and wear.

BENN BROTHERS

The report of this London firm of publishers for the year ended June 30, 1927, states that losses and difficulties resulting from the general strike and the coal stoppage have been more than balanced by the further expansion of the company's activities in new directions. The directors consider that the time has arrived for capitalisation of part of general reserve and an increase in authorised capital. The resolutions for carrying out these proposals will be considered at an extraordinary general meeting to be held immediately after the annual meeting. The effect of the resolutions is to increase the capital from £150,000 to £250,000 by the creation of 99,250 preference shares of £1 each and 15,000 deferred shares of 1s. each. The net profit for the year under review amounted to £37,552, plus £16,800 brought in. Directors have allocated to leasehold reserve £1,500, and to general reserve £10,000. The dividend recommended will absorb £24,097, leaving £18,756 to be carried forward.

DAVID THOM AND CO., LTD.

The accounts for 1926 of this company of soap and glycerine manufacturers show a profit of £3,991, plus £3,497 brought in. Dividends have been declared of 6½% on the preference shares and 10% on the ordinary shares, carrying forward £3,008.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. (Chloride of Ammonia.—£37—£45 per ton, carr. paid.)
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.

Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—3s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £8 10s.—£9 5s. per ton. Grey, £15 10s. per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£6 15s.—£10 per ton according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 9d.—4s. per gal., 60% O.P. Solvent, 3s. 11d.—4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4—£5 10s. per ton and upwards, according to grade.
 Brown Sugar of Lead.—£40 15s.—£41 10s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 4½d.—2s. 8d. per gal.
 Acid Cresylic, 99/100.—2s. 8d.—2s. 9d. per gal. 97/99.—2s. 1½d.—2s. 4½d. per gal. Pale, 95%, 2s.—2s. 3d. per gal. Dark, 1s. 9d.—2s. 1d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 11d.—1s. per gal., ex works in tank wagons; Standard motor, 1s. 9d.—2s. 2d. per gal., ex works in tank wagons; Pure, 1s. 7d.—2s. 3d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 8d.—1s. 10½d. per gal. Pure, 2s.—2s. 3½d. per gal.
 Xylol.—2s.—2s. 4d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10½d. per gal. Standard specification, 6½d.—8½d. per gal. Middle Oil, 7½d.—7½d. per gal. Heavy, 8½d.—8½d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/160, 1s. 2d.—1s. 6d. per gal. Solvent 95/160, 1s. 5d.—1s. 6d. per gal. Solvent 90/190, 11d.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—80s.—87s. 6d. per ton, f.o.b. according to district. Nominal.
 Pyridine.—90/140.—7s.—13s. per gal. Nominal. 90/180.—4s. 6d.—5s. per gal. Heavy.—5s.—8s. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.).—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Nevillo and Winther.—4s. 9d. per lb. 100% basis d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—8s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzdine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 9d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—5 cwt. lots Cryst. 41s. per cwt. Powder 45s. per cwt. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 7½d.—1s. 10d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 3d.—1s. 6d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 9d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £30 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzophenol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively: Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—5 cwt. lots, Crystal 25s. per cwt. Powder 27s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d. per lb. Potassium.—1s. 11d. per lb. Sodium.—2s. 2d. per lb. Granulated ½d. per lb. less. All spot.
 Calcium Lactate.—1s. 3½d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—1 lb., 16s. per doz.; ½ lb., 9s. 6d. per doz.; ¼ lb., 6s. 6d. per doz.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 11s.—14s. 6d. per lb., according to quantity; Liquid (95%), 12s. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—6s. 10d. per lb.; Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.; Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923—2s. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—97s. 6d. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb.; Crystal, 1s. 10d.—1s. 11d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonol.—6s. 6d.—6s. 9d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
 Thymol, Puriss.—10s. 6d.—10s. 9d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
 Aubepine (ex Anethole).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 6d. per lb.
 Ethyl Cinnamate.—6s. 6d. per lb.
 Ethyl Phthalate.—2s. 9d. per lb.
 Eugenol.—9s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safral.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—17s.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.
 Camphor.—70s. per cwt. Cananga, Java, 26s. per lb.
 Cassia, 80/85%.—7s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%. 1s. 11d. per lb., Ceylon, Bure, 1s. 9d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%. 22s. 6d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 18s. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Sept. 21th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on August 11th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Boistel, Hugel, and Paul. Manufacture of catalysts etc. 18,997. July 18. (Ger., 28.2.27.)

British Rotary Filter Co., Ltd., and Talbot. Apparatus for subjecting materials to continuous washing etc. 19,457. July 22.

Brooks. Filters etc. 18,974. July 18.
 Campbell, and Electric Furnace Co. Manufacture of crucibles etc. 19,145. July 19.

Carpmael (I.-G. Farbenind.). Distillation etc. process. 19,316. July 20.

Chadwick. Treatment of smoke etc. from furnaces etc. 18,999. July 18.

Coplan. Capola furnaces. 19,068. July 18.

Excelsior Feuerlöschgerate A.-G., and Schnabel. Producing foam for fire extinguishing. 19,538. July 22.

International Combustion, Ltd., and Rosencranz. Pulverising systems. 19,026. July 18.

Knoch. Process for manufacture of stable dry substances from colloidal liquids. 19,114. July 21.

Laing. Filters. 19,176. July 19.

Meyerhofer. Continuous conversion of solids etc. 19,289. July 20. (Ger., 24.7.26.) Furnaces. 19,531. July 22. (Ger., 27.7.26.)

Simon. Shaft furnaces. 19,413. July 21.

Soc. L'Air Liquide. Carrying out exothermic catalytic chemical reactions. 19,049 and 19,187. July 18 and 19. (Fr., 30.4.27 and 9.8.26.)

I.—Complete Specifications

145 (1926). Vicars, Ltd., and Crosland. Ovens for baking, drying, etc. (273,861.)

1237 (1926). Disney and Kernot. Emulsifying agents. (274,142.)

20,203 (1926). Carborundum Co., Ltd. Furnaces. (257,261.)

11,607 (1927). Theisen and Theisen. Centrifugal apparatus for treating gases with liquids. (270,340.)

*22,234 (1926). Electrolytic Zinc Co. of Australasia. Centrifugal separators. (274,406.)

*18,645 (1927). Nivling. Viscosimeters. (274,479.)

II.—Applications

Chadwick. 18,999. See I.

Coley and Kekwick. Productions of hydrocarbons. 19,368. July 21.

I.-G. Farbenind. Dehydration of moist fuel. 18,996. July 18. (Ger., 21.7.26.) Production of liquid hydrocarbons etc. 19,279. July 20.

Johnson (I.-G. Farbenind.). Manufacture of viscous oils. 19,374. July 21. Oxidising paraffins etc. 19,501. July 22.

Koks- und Halbkoks-Brikettierungs-Ges. Manufacture of briquettes. 19,270. July 20. (Ger., 24.7.26.)

Laing and Nielsen. Distillation of carbonaceous materials. 19,619. July 23.

Lederer. Production of carbon. 19,294. (Austria, 21.7.26.)

Power-Gas Corporation, Ltd., and Rambush. Gas producing etc. plant. 19,253. July 20.

Smith. Gas-producers. 19,302. July 30.

II.—Complete Specifications

6435 (1926). I.-G. Farbenind. Manufacture of hydrocarbons and derivatives. (249,501.)

7054 (1926). I.-G. Farbenind. Manufacture of hydrocarbons. (249,156.)

7099 (1926). Toogood, and Dempster and Sons, Ltd. Gasworks retort settings. (274,154.)

13,342 (1926). Kling and Florentin. Obtaining light hydrocarbons. (253,507.)

18,128 (1926). Cachemulle (Bunting). Coal pulverisers. (274,278.)

19,155 (1926). Wollaston. Gas-producer and furnace combined. (274,286.)

23,543 (1926). Collin & Co. Coking retorts. (266,286.)

9216 (1927). Silica en Ovenbouw Mij. Coke ovens. (268,832.)

12,778 (1927). I.-G. Farbenind. Manufacture of hydrocarbons and derivatives. (274,410.)

15,262 (1927). I.-G. Farbenind. Manufacture of hydrocarbons. (274,404.)

*18,439 (1927). Producing oils from coal. (274,465.)

III.—Application

Soc. des Etabl. Barbet. Distillation of gas tar etc. 19,078. July 18. (Fr. 17.7.26.)

III.—Complete Specification.

*19,078 (1927) Soc. des Etabl. Barbet. Distillation of gas or coke-oven tars. (274,513.)

IV. Applications

Carmichael (I.-G. Farbenind.). Manufacture of dyestuffs. 19,066—7. July 18.

Gegy A.-G. Manufacture of azo dyestuffs. 19,493. July 22. (Ger., 29.7.26.)

I.-G. Farbenind. Manufacture of carboxylic acids of acenaphthene. 19,492. July 22. (Ger., 24.7.26.) Manufacture of derivatives of acenaphthene. 19,602. July 23. (Ger., 24.7.26.)

Johnson (I.-G. Farbenind.). Production of nitrogenous dyestuffs. 19,605. July 23.

Scottish Dyes, Ltd., Anderson, Thomas, and Thomson. Production of benzanthrone derivatives. 19,315. July 20. Production of dyestuffs. 19,514. July 20.

IV.—Complete Specifications

4842 (1926). I.-G. Farbenind. Production of azo-dyestuffs and lakes insoluble in water. (250,909.)

7195 (1926). Drescher, Harris, Wylam, Thomas, and Scottish Dyes, Ltd. Dyes and dyeing. (274,156.)

10,148 (1926). I.-G. Farbenind. Manufacture of anthraquinone derivatives. (250,968.)

10,281 (1926). Carmichael (I.-G. Farbenind.). Manufacture of anthraquinone derivatives. (274,211.)

10,998 (1926). British Dyestuffs Corp., Shepherdson, and Hailwood. Preparation of indanthrone disulphonic acids and indanthrone. (271,226.)

21,955 (1926). Wylam, Harris, Thomas, and Scottish Dyes, Ltd. Dyes and dyeing. (274,303.)

*18,936 (1927). Haller and Kappeler. See XX.

V.—Applications

British Celanese, Ltd., Ellis, Kirk, and Olpin. Treatment of materials containing cellulose derivatives. 19,118. July 19.

British Celanese, Ltd., Ellis, and Olpin. Treatment of materials containing cellulose derivatives. 19,155, 19,222, and 19,252. July 19 and 20.

Calvert. Treatment of viscose artificial silk yarn. 19,232. July 20.

Celli. Transforming vegetable fibres into product resembling wool. 19,390. July 21.

Dreyfus. Production of solutions etc. of cellulose esters etc. 19,364. July 21.

Hetherington & Sons, Ltd., and Wellfens. Manufacture of artificial silk etc. 19,105. July 19.

I.-G. Farbenind. Opening-up materials containing cellulose. 19,424. July 21. (Ger., 21.7.26.)

Lilienfeld. Treating cotton fabrics. 19,027. July 18. (U.S., 20.7.26.)

Mellor. Treatment of viscose artificial-silk yarn. 19,232. July 20.

V.—Complete Specifications

30,563 (1926). Krupp Grusonwerk. Cleaning plant fibres. (262,761.)

*12,104 (1927). I.-G. Farbenind. Protecting materials from moth. (274,425.)

VI.—Applications

Johnson (I.-G. Farbenind.). Desizing processes. 18,995. per cwt., Great Brit.

Kohorn & Co., and Perl. Apparatus for wet treatment of textile material. 19,305. July 20. (Ger., 20.7.26.)

VI.—Complete Specifications

7195 (1926). Drescher, Harris, Wylam, Thomas, and Scottish Dyes, Ltd. See IV.

9622 (1926). Wilson, Thomas, and Scottish Dyes, Ltd. Dyeing and printing of vat colours. (274,178.)

16,613 (1926). Silver Springs Bleaching & Dyeing Co., Ltd., Mason, and Hall. Mercerising etc. textile materials containing viscose artificial silk. (274,266.)

18,024 (1926). Sandoz Chemical Co., and Woodhead. Dyeing cotton materials. (274,276.)

21,955 (1926). Wylam, Harris, Thomas, and Scottish Dyes, Ltd. See IV.

6845 (1927). Eclipse Textile Devices, Inc. Dyeing. (267,548.)

VII. Applications

Coley. Production of zinc white. 19,503. July 22.

Johnson (I.-G. Farbenind.). Process for recovery of sodium nitrate. 19,373. July 21.

Rosenheim. 19,393. See XXXIII.

Suida. Recovering concentrated acetic acid from dilute acetic acid. 19,074 and 19,544. July 18 and 22. (Austria, 9.11.26.)

VII.—Complete Specifications

10,052 -3 (1926). Applby and Carter. Manufacture of solid sodium hypochlorite preparations. (274,197—8.)

15,951 (1926). Moore, Polack, and Castner-Kellner Alkali Co., Ltd. Manufacturing ammonium chloride. (274,263.)

20,785 (1926). Stevens, Norris, and Watson. Removal of silica from zinc, copper, and vanadium solutions. (274,297.)

10,827 (1927). Gaillard. See XVI

VIII.—Applications

Campbell, and Electric Furnace Co. 19,145. See I

Norway and Scholz. Stained glass etc. 19,437. July 22.

VIII.—Complete Specifications

11,117 (1926). Hancock. Manufacture of pottery. (274,230.)

32,126 (1926). Scheidhauer & Gessing A.G. Manufacturing refractory acid-proof and other ceramicity-bonded products. (263,194.)

5588 (1927). Hartford Empire Co. Glass furnaces. (273,245.)

IX.—Application

Lutovich. Asphalte colouring. 19,153. July 19.

IX.—Complete Specification

8746 (1926). Soc. Anon. des Chaux et Ciments de Lafarge et du Teil. Manufacture of cement. (250,246.)

X.—Applications

Ashcroft. Metallurgy of ores. 19,606. July 23.

Coplan. 19,068. See I.

General Electric Co., Ltd., and Smithells. Chemically resistant alloys. 19,358. July 21.

Goebel and Rademacher. Magnetic separation of minerals. 19,399. July 21. (Ger., 23.7.26.)

Marks (Kemet Laboratories Co.). Producing metals. 19,043. July 18.

Schrobsdorff. Production of alloys etc. 19,121. July 19. (Ger., 21.7.26.)

Siemens & Halske A.-G. Electrical depositing of chromium. 19,608. July 23. (U.S., 27.7.26.)

Steinheil. Alloys. 19,603. July 23.

X.—Complete Specifications

18,669 (1926). Davis, and Metropolitan-Vickers Electrical Co., Ltd. Sintering refractory metals. (274,283.)

28,741 (1926). Loos, Lehnig, Henning, and Dassdorf. Composition for coating metal etc. (274,333.)

849 (1927). Loos, Lehnig, Henning, and Dassdorf. Coating metal etc. (274.355.)

*7327 (1927). Piwowarsky and Oberhoffer. Production of high grade iron or steel. (274.419.)

*16,155 (1927). Wüst. Purifying pig iron. (274.438.)

*17,831 (1927). Buess. Rotary melting furnaces. (274.451.)

*18,217 (1927). Verein. Stahlwerke. Manufacture of high-grade cast iron. (274.457.)

*18,635 (1927). Sundberg. Electrodeposition of copper or its alloys. (274.477.)

*18,706 (1927). Rachleff and Gofmann. Chemical welding of metals. (274.481.)

XI.—Applications

Electric Furnace Co., Ltd., and Taylor. Crucibles for electric furnaces. 19,144. July 19.

Marks (Batterien- und Elemente-Fabr. System Zeiler). Production of insulating material etc. 19,518. July 22.

Siemens & Halske A.-G. High-frequency inductance furnace. 19,377. July 21. (Ger., 24.7.26.) 19,608. See X.

Western Electric Co., Inc. (Bell Telephone Laboratories, Inc.). Insulating-materials. 19,058. July 18.

XI.—Complete Specifications

11,463 (1926). Wade (Philips' (Gloeilampenfabr.). Manufacture of oxide cathodes. (274.233.)

32,942 (1926). British Thomson-Houston Co., Ltd. Inductance furnaces. (263,856.)

16,493 (1927). Harrison. Electrolytic process and apparatus. (274.405.)

*18,635 (1927). Sundberg. See X.

XII.—Application

Soc. des. Etabl. Barbet. Extraction of glycerin. 19,203. July 19. (Fr., 19.7.26.)

XII.—Complete Specification

*19,203 (1927). Soc. des Etabl. Barbet. Extraction of glycerin from distillery vinasses. (274.519.)

XIII. Applications

Baron Nixon and Lamson Paragon Supply Co. Production of colour compositions for printing. 19,072. July 18. Manufacture of carbon papers etc. 19,073. July 18.

British Thomson-Houston Co., Ltd. Resinous compositions etc. 19,366. July 21. (U.S., 2.8.26.)

Glaserit Werke Winkelmann. Production of coating materials. 19,130. July 21. (Ger., 9.4.27.)

Kunstharzfabrik Pollak. Production of artificial compositions. 19,306. July 20. (Austria, 31.5.27.)

XIII.—Complete Specifications

3737 (1926). Meigs. Forming synthetic resinous materials. (274.146.)

4842 (1926). I.-G. Farbenind. See IV.

7131 (1926). Mond (I.-G. Farbenind.). Production of resinous condensation products from aromatic amines. (274.155.)

21,354 (1926). Craven, Bedford, and Yorkshire Dyeware & Chemical Co., Ltd. Manufacture of a cement for linoleum etc. (274.300.)

32,896 (1926). Grasselli Chemical Co. Producing aldehyde amine condensation products. (263,853.)

XIV.—Application

Noar. Manufacture of sponge rubber. 19,123. July 19.

XIV.—Complete Specification

7248 (1927). Carlsson. Regeneration of vulcanised rubber. (274.387.)

XV.—Complete Specification

*18,758 (1927). Hönsch. Preparing a cold glue powder. (274.490.)

XVI.—Complete Specifications

24,577 (1926). Hochstetter and Schneidel. See XIX.

10,827 (1927). Gaillard. Treating superphosphates. (269,921.)

XVIII.—Complete Specifications

10,937 (1926). Hansena A.-G. and Nathan. Fermenting and maturing beer (274.225.)

27,300 (1926). Croad (Noldin.) Manufacturing vinegar. (274.328.)

*19,203 (1927). Soc. des Etabl. Barbet. See XII.

XIX.—Applications

Baker Perkins, Ltd., and Socy. Jeanjean et Cie. Manufacture of chocolate etc. 19,515. July 22.

Dawkins. Preparation of tea. 19,108. July 19.

George and Hall. Treatment of wheat etc. 19,164. July 19.

Stabback. Preservation of edible products. 19,000. July 18.

XIX.—Complete Specifications

9083 (1926). Vautin and Whiffen. Preservation of food-stuffs etc. (274.164.)

10,076 (1926). Fowler and Edser. Preservation of natural products. (274.200.)

24,577 (1926). Hochstetter and Schneidel. Preserving animals and plants. (274.314.)

XX.—Applications

Binz and Rath. Production of nitropyridinearsinic acids. 19,071. July 18. (Ger., 5.8.26.)

British Celanese, Ltd., Bader, and Dreyfus. Manufacture of aliphatic compounds 19,597--8. July 23.

XX.—Complete Specifications

16,503—4 (1925). Dreyfus. Production of aliphatic compounds. (273,622 and 273,810.)

9470 (1926). Potts (Chem. Fabr. Grunau, Landshoff & Meyer). Manufacture of *N*-monoalkyl-*p*-aminophenol. (274.175.)

15,428 (1926). Heyn. Production of alkylene diguanidines. (274.259.)

3327 (1927). Imray (I.-G. Farbenind.). Manufacture of 1-phenyl-3-methyl-5-pyrazolone. (274.366.)

*16,198 (1927). Chem. Fabr. vorm. Schering. Manufacture of alkylated phenols and their hydrogenated products. (274.439.)

*18,743 (1927). Soc. Anon. Distilleries des Deux-Sevres. Manufacture of crotonic aldehyde and its homologues. (274.488.)

*18,797 (1927). Comp. de Bethune. Catalysts for the synthesis of alcohols. (274.492.)

*18,936 (1927). Haller and Kappeler. Manufacture of condensation products of arylamines. (274.501.)

XXI.—Application

Gschopf. Colour cinematography. 19,298. July 20. (Austria, 15.1.27.)

XXI.—Complete Specification

17,550 (1926). I.-G. Farbenind. Manufacturing photographic silver halide emulsions. (259,538.)

XXIII.—Applications

Baron (Neumann). Water-softening apparatus. 19,179. July 19.

Burt, Hoperoff, and Paton. Treatment of sewage etc. 19,611. July 23.

Rosenheim. Production of base-exchanging substances. 19,393. July 21. (Ger., 1.9.26.)

XXIII.—Complete Specification

9863 (1926). British Dyestuffs Corp., Fairbrother, and Renshaw. Disinfectant tablets etc. (274.187.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:— *Australia*: Glassware, chinaware, hardware (69); chemicals and machinery (Official Secretary, Commercial Bureau, Australia House, W.C.2, ref. 471). *British India*: Iron piping, asbestos goods, leather cloth and olecloth (70); foundry sand conveyors (91, Petty France, Westminster, S.W.1). *France*: Technical and industrial rubber goods (76). *Greece*: Oil in barrels, bar tin (79). *Hagti*: Laundry soap (86). *Holland*: Rubber (81). *South Africa*: White lead oil paste (B.X. 3662); filtration plant (A.X. 4972). *Turkey*: Pharmaceutical preparations (83).

Sulphate of Ammonia

Nitram, Ltd., Victoria Station House, London, S.W.1, has issued a leaflet (2/28N) giving the prices at which orders will be booked for sulphate of ammonia for home agricultural use during the present season. The new price for August, £9 18s., represents a reduction of 48s. per ton, or nearly 20%, compared with the price for last spring. At the average of the prices given, the unit of nitrogen in sulphate of ammonia costs about 9s. 11d. The quotations refer to 6-ton lots.

News from Advertisements

There is a vacant lectureship in fuel technology at the Imperial College of Science and Technology (p. vi).

A Coal Research Fellowship at the Imperial College of Science and Technology is offered in connexion with Sensible Heat Distillation, Ltd. (p. vi).

Students will be interested in the facilities offered at the Imperial College of Science and Technology for study and research in fuel technology, chemical engineering and electro-chemistry (p. vi).

The University of St. Andrews (Scotland) gives particulars of various courses and examinations for the Session 1927–28 (p. vi).

The British School of Malting and Brewing at the University of Birmingham is advertising a Diploma Course, Certificate Courses, and a Faculty of Science Degree Course (p. vi).

A firm of manufacturing pharmaceutical chemists is advertising for analysts (p. vi).

A chemist (B.Sc.) desires a chemical or commercial position (p. vi).

Surplus chemical manufacturing plant is for sale (p. vi).

There are 105 firms represented under the various headings in our Buyers' Guide.

No. 32

EDITORIAL

Liquor Effluents from Gas Works

THE Chief Alkali Inspector, Dr. T. L. Bailey, has published in his Annual Reports, during the past few years, the results of his investigations upon the methods of removing from the effluents from sulphate of ammonia plant those constituents which are harmful when added to sewage beds or rivers. This valuable work was summarised by him in a paper before the Institution of Chemical Engineers in 1925.

Now it appears that his pioneer work has been taken up by the gas industry, with the result that a special Research Committee of the Institution of Gas Engineers entitled "The Liquor Effluents Research Committee" has been appointed to look into this subject. We are glad to see that the Institution has obtained the co-operation of Dr. Bailey as a member of the committee.

The First Report of this new committee is now to hand. It sets down the object of the work as being to investigate the methods, which might be adopted, for minimising the production of gas liquor effluents, or for rendering such effluents suitable for running into town sewers or into rivers and streams. The Report is divided into two sections - the first is a memorandum prepared by Dr. A. Parker on the subject of the disposal of liquor effluents from gas works, which gives a careful summary of the existing knowledge of the subject. The second part gives a summary of conclusions drawn from experiments at Hinckley, which have been carried out by Dr. Monkhouse.

Expressed in a few lines, if we understand it correctly, the effluent problem may be stated as follows. The waste liquor from sulphate of ammonia plants contains obnoxious constituents, which may be termed oxygen absorbing bodies. These are, in the main, phenols and oxidation products of ammoniacal liquor. Ammoniacal liquor becomes contaminated by phenolic bodies when there is excessive contact between tar and liquor; and ammoniacal liquor becomes oxidised by contact between liquor and air. To reduce to a minimum the difficulties associated with effluent disposal, the aim is therefore to produce a minimum volume of liquor and to keep the ammoniacal liquor as clean as possible, by collecting and

keeping it as far as is practicable out of contact with tar and air.

As regards methods of purification or disposal of spent gas liquor, several proposals have been put forward. It has been suggested to purify the liquor in bacterial beds, by flue gases, by chemical means, by solvents and so on. In the Report of the Investigation Committee, however, it is considered that the only satisfactory method of disposing of the liquor at the present time is to admit it under careful control into the sewage stream.

One occasionally hears of troubles between local authorities and gas works as regards effluent disposal, but we venture to think that in many cases these troubles would disappear if there was co-operation between the sewage disposal authorities and the gas works. It is the responsibility of the gas works to reduce the obnoxious constituents to a minimum and to supply the waste liquor in a carefully adjusted stream. Under these circumstances, the sewage beds should be able to deal with the spent liquor with little difficulty.

It would be premature at this stage to discuss the experimental work which the Research Committee is undertaking, but the Second Report should have some interesting data. The Institution of Gas Engineers is to be congratulated on its foresight in the formation of this committee and in the prosecution of the research work. In this way it is doing its best to solve a difficulty before it has grown to dimensions of any serious magnitude.

The Origin of "Sour Gas"

Anyone who has passed by the excavations made by a gas authority in the street must have noticed the curious odour which often rises from it. Such an odour is usually ascribed to "sour gas," an explanation which seems to assume that even coal gas may possess at some time linked sweetness, long drawn out. An interesting observation which throws new light on the question is recorded by Mr. Arthur Marsden, in a paper read recently before the Western Junior Gas Association and published in the *Gas Journal*. In the course of

extensions to plant at a gas works, it became necessary to open up a gas holder main, and an 18-in. foul main, which was exposed at the same time, was found to be partially covered with a beautiful deposit of greyish-white fibrous crystals, which much resembled a mass of asbestos. As it was thought that the occurrence might have some bearing on the corrosion of mains, the deposit was analysed and found to consist to the extent of nearly 94% of calcium acetate. The "sour gas" odour, however, led Mr. Marsden to surmise that some higher fatty acid was present, and the results given by dry distillation of a sample showed that a butyrate was also present. The origin of the deposit still remains uncertain, though it is thought that, as the main carries hot crude gas, the warmth has encouraged bacteria to utilise food borne by soil water from higher ground. Endeavour is now being made to trace the organisms responsible for this interesting synthesis, for it seems probable that the process is an example of symbiosis, an association which we find fairly commonly in the plant world, the products of one organism being utilised for further change by another organism closely associated with it. The pipe was laid some forty years ago, so that the process must be a fairly slow one, and is hardly ready for large-scale exploitation. It is another example of the prowess of the lower organisms as manufacturers, working at low potentials, utilising waste materials, but carrying out organic syntheses with an ease which we cannot yet emulate. Mr. Marsden's paper has whetted our curiosity, and we hope that, not only shall we soon learn the names of the organisms which produce the deposit, but that the attention of others will be drawn to the rather neglected possibilities of microbiology. Excavations are usual features of our modern streets, and now "sour gas" will, thanks to Mr. Marsden, serve as a general reminder of the unexplored realms that await the attention of the chemist and the bacteriologist.

Research

The appreciation of the necessity for research and, still more, of the benefits which accrue from it, is growing, we think, in a satisfactory manner. From an article in *British Industries*, which is the official organ of the Federation of British Industries, we learn that during the 12 months ended in June last, the electrical industry had a "record" year, for, although the home trade decreased, not unnaturally, by 6%, the exports increased by 134%. The electrical industry believes in research, and one wonders if this satisfactory situation is a result of that belief. Another aspect of research, the subservience of its application to economic considerations, is well illustrated in the article, on the present position of low-temperature carbonisation, which Major Henrici has contributed to this issue. The conclusion which he reaches is that the success of the various processes of low-temperature carbonisation will largely depend on the degree to which they can combine with other industries, and so ensure the proper utilisation of all the products, whether solid, liquid or gaseous. So far, it appears, no process has yet proved that it can make a profit. We shall await with interest the results of the exploitation by Fuel Production, Ltd., of the process developed at the Fuel Research Station, for in the not

too distant future, data should be forthcoming to clarify the financial aspects of the problem, and the present uncertainty regarding the value of the by-products of the process should be largely removed. Research of another, but no less important kind, is illustrated by the Report of the Food Investigation Board for the years 1925 and 1926, of which a short account appears on another page. It is gratifying to note that the increasing interest taken by the food industries in research has not been allowed to hinder attention to those investigations which keep the basal knowledge not merely abreast but well ahead of the practical problems. The Report should be widely read, for it is of concern to all.

The Chemical Engineer

Last week it was our privilege to record the publication of the fourth volume of the Transactions of the Institution of Chemical Engineers. One does not readily remember that the Institution is, in point of age, a mere stripling amongst the scientific bodies of our land. It is pleasant, however, to look back over the few years since its inception and admire the progress it has made and its contributions to the advancement of knowledge, and recall the many pleasant meetings which it has arranged. One of the chief duties of the Institution, one which it has ever held steadfastly before it, is, as Sir Arthur Duckham said in the course of his presidential address in 1925, to organise courses of technical education and to institute examinations which will develop and stamp students as chemical engineers. In pursuance of this duty, the Institution examined the facilities available for instruction and, after consulting representative industrial leaders, drew up the well-known Memorandum in which the Institution lays down the lines on which it considers the training of the chemical engineer should proceed. The Memorandum has been circulated among education authorities, and we believe it has had the result of securing a considerable amount of co-operation in framing a suitable training for would-be members of the profession. To the Institution also falls the duty of deciding the standard to which its members must attain, and last year we recorded the publication of the papers which had been set at the first examination for Associate-Membership. This week-end we have been able to counteract the charm of this lovely summer by a consideration of the questions which were set for the second examination, held in the middle of July. We were greatly interested by the various papers and thought that they were exceedingly well designed to show how far the candidates were able to appreciate the fundamental principles which they would be called upon to apply in industry. It seems to us that students who can satisfactorily answer such papers should make worthy members of the chemical engineering profession. Those who still are uncertain about the definition of the title "chemical engineer" could not do better than read these papers carefully; they will realise not only the type of knowledge required, but also its breadth and its close relation to the practical affairs of chemical industry. We are glad to be able to print the papers set at the recent examination for Associate-Membership of the Institution in this issue, as we think that they will be of particular interest to chemical engineers and chemists alike.

THE PRESENT POSITION OF LOW-TEMPERATURE CARBONISATION

BY MAJOR E. O. HENRICI

The carbonisation, or distillation, of coal at low temperatures is rousing considerable interest in many quarters, technical, financial, and political, but not all well informed, and there is some evidence of confusion in the minds of many speakers and writers as to what such processes can achieve and how near they are to achievement. There is more than one process of low-temperature carbonisation, just as there are several high-temperature processes, and they have different objects. For example, the first, and essential, requirement of the gas industry is a sufficient supply of gas of suitable and uniform quality. Any coke, tar, or other by-products are useful as sources of income, but they are necessarily of secondary importance. Similarly, the first requirement of the coke-oven industry is the supply of coke suitable for metallurgical and other purposes; gas, tar, etc., are useful if they can be disposed of. The type of plant to be adopted depends in the first place on the primary product required and the nature of the coal to be used, and in the second place on the relative importance of the various by-products, which again depends on the markets locally available.

The primary object of low-temperature carbonisation is not so clearly defined. One object, perhaps the most important from the national health point of view, is the production of a solid smokeless fuel suitable for use in the ordinary domestic grate, or cooking range, and in the smaller industrial furnaces. The general adoption of such a fuel would go a long way towards providing our cities with a purer atmosphere and abolishing what is generally referred to as the "smoke nuisance." If this object is to be achieved the coke produced must be in a suitable lump form, strong enough to stand transport, easily ignitable, and reasonably free from ash.

Such a fuel can be produced from suitable coal in retorts in which it lies quiescent during carbonisation, such as the Parker retorts, or where it is only moved intermittently, as in the Fuel Research Station retorts. Any turning over, or considerable movement during carbonisation, tends to form an undesirable amount of small coke. Experience at the Fuel Research Station indicates that any medium- or strongly-caking coal can be used, or a blend of weakly- and strongly-caking coals. It is found most satisfactory to charge the coal to the retorts in the form of nuts, with sizes below $\frac{3}{8}$ inch screened out. Sizing the coal in this way increases both the throughput of the retort and the yield of tar. With a strongly-caking coal the resulting coke is in large lumps; with a weakly-caking coal the coke remains, generally speaking, in the same sized lumps as the coal charged. If large quantities of coal are to be treated with a view to supplying domestic fuel, it will be necessary to utilise the fine coal as well as the larger sizes. This can be done by briquetting before carbonising, or in other ways.

A process such as that outlined above produces a considerable amount of rich gas, with a calorific value in the neighbourhood of 1000 B.Th.U. per cub. ft., and full value for this can only be obtained if it be used for

town's gas, in other words, if disposed of through a gas undertaking. In such a case it should be possible to credit the process with 3d. to 4d. a therm for the gas produced, whereas if the gas were used directly for heating the retorts, or under boilers, or for any other purpose where the high calorific value was of no particular advantage, the cash value of the gas would only be 1d. or 2d. a therm. For this reason it would appear that, generally speaking, the proper place for carbonising coal when the coke is to be used for domestic purposes is at a gas works. This has the further advantage that a market for the coke is also available on the spot, with a selling agency in existence.

For these reasons the Government asked Sir David Milne Watson, the Governor of the Gas Light and Coke Company, to go into the whole matter, and to say:—

(a) Whether, in his opinion, any of these processes had reached such a point of development that it was worth while for his Company to continue the experimental development on a large scale;

(b) If so, whether he considered the selected process or processes sufficiently promising to justify his Company in taking the entire risk of this development;

(c) If not, whether he would submit a scheme, after discussion, whereby the Government would be asked to bear a part of the risk involved.

The result of his report was that a subsidiary company (Fuel Production, Ltd.) has been formed, the capital of which has been guaranteed under the Trades Facilities Act, to erect a plant at the Richmond Gas Works with a capacity of 100 tons a day, and of the general design developed at the Fuel Research Station. This plant will be worked by the Gas Light and Coke Company, and the experience gained should show in the course of two or three years whether such a scheme will pay or not. Arrangements have been made by which all the experience gained will be freely at the disposal of any company desirous of taking up the process. Further particulars of the system, and of the arrangements made, will be found in the Annual Report of the Fuel Research Board for 1926, and in the report of a debate on Coal (Scientific Research) in the House of Commons on May 11, 1927.

Low Temperature Carbonisation, Ltd., are also erecting a plant on the "Parker" system, and the results obtained will afford parallel experience.

It does not follow that processes producing domestic fuel should necessarily work in connexion with a gas works. For example, the Maclaurin and the Midland Coal Products processes produce a lump coke, but as the retorts are internally heated by the combustion of a portion of the charge, the gas produced is large in volume and low in calorific value. It is not suited for general town supply, but only for heating retorts, boilers, furnaces, etc., or for use in internal-combustion engines, and then only when it can be used near the retorts where it is produced. Commercial plants on both these systems are in use, but both are finding a difficulty in obtaining a remunerative outlet for the gas. Neither process is suitable for carbonising a strongly caking coal.

In some cases the primary object of low temperature carbonisation may be the recovery of the oil-producing

tars from the coal, the solid residue being used as an industrial fuel. In these cases the technical problem is in some respects simpler, as the coke need not be in lump form, nor is low ash content of such importance. It is thus possible to use a system in which the coal is turned over during carbonisation, thus increasing the output by more rapid heating of the coal, and a lower grade coal can be used. On the other hand the coke will have a lower value than has domestic fuel. A process in which the coal is turned over during carbonisation will also give as a rule a higher tar yield, and the tar may be less "cracked." Strongly-caking coals are not suitable for this type of retort. Many types of retorts, mostly on the rotary principle, have been proposed for such purposes, and these may be either internally or externally heated. Several large-scale plants are being erected in this country and abroad to test the commercial feasibility of this type of process.

A plant which stands rather in a category by itself is that on the McEwen-Runge system, which is being tested at the Milwaukee power station. In this system the coal is pulverised and then carbonised in a current of hot gas, the tar is recovered, and the coke burned in the pulverised form in which it emerges from the retort.

In other cases, again, the primary object may be to produce a comparatively high-grade solid fuel from a low-grade raw material, with the recovery of such gas and tar as may be feasible. Such processes have the greatest promise of success where large quantities of low-grade fuel exist naturally, where they can be cheaply mined, as is the case with the brown coals in Germany, Canada, and Australia. They have also a definite but somewhat limited application in this country.

The most suitable site for the plant depends on the circumstances of each case. Where the coke is to be charged direct to furnaces there are advantages in having the plant close to the furnaces. Where a low-grade fuel is to be stepped up into a higher-grade solid fuel, a site near the colliery is indicated, but in all cases a suitable outlet for the gas is of importance, and in many cases the price obtained for the gas will decide whether or no the project is a financial success. It will be realised from what has been said that low-temperature carbonisation processes are largely dependent for success on the degree to which they can combine with other industries so that all the products, solid, liquid and gaseous, can be used with advantage.

One great source of uncertainty in the financial outlook—and a financial profit is essential if any process is to be developed commercially—is the still unknown value of the tar. The tar is different both from high-temperature tar and from natural oils. Its properties have not yet been fully investigated, and their study forms the subject of most interesting research which is being actively pursued in several quarters, private and official, from various aspects. There is no doubt that these tars will yield fuel oil and motor spirit, but the best methods of treatment are not yet fully worked out. They will probably yield lubricating oils, and certainly various chemical products of use in the manufacture of disinfectants, preservative paints, and probably dyes and fine chemicals.

It is impossible in the space available to attempt to describe, or even to mention, the large number of different processes that have been tried or are being developed, but it can be said that over half a dozen different types of plant of a commercial size are, or are being, erected in various parts of the world, and the results obtained in the next few years should give information on various factors which are still unknown, such as the cost of working, the life of the retorts, and the prices to be obtained for the various products when these are available in considerable quantities. It is, unfortunately, still a fact that no process has yet proved that it can make a profit. It is to be hoped that this statement will no longer be true in the not too distant future.

REPORT OF THE FOOD INVESTIGATION BOARD*

The years 1925 and 1926, reviewed in the present Report, were noteworthy for the increased attention paid to industrial problems. When the Board started, work was mainly devoted to basal problems, but gradually the interest of the industry was aroused to such an extent that the demands on the staff for the solution of special problems increased to a point that it threatened to prevent them from fulfilling their primary duty, that of keeping the basal knowledge not merely abreast but well ahead of the practical problems. Relief was afforded, however, as the Imperial Economic Conference was so impressed with the work of the Low Temperature Research Station, that when the Empire Marketing Board was established it provided funds to increase the size of the station. Specific investigations for outside bodies have related to the freezing of fish, the leakage of vapours from storage chambers, the conditioning of meat, the carriage of hams without the use of preservatives, the carriage of liquid eggs and so on. A new laboratory has been established at Covent Garden Market, and will make it possible to carry out a scientific survey of the conditions of produce after transport and storage.

In the report of the Director of Food Investigation for 1925 and 1926, the various sections have been written by the officers who have actually conducted the researches described.

Much interest attaches to the work on the water content of muscle, as no satisfactory explanation is available of the remarkable water-holding power of some colloids in the state of gels, or of the tissues of animals and plants. Work has been done on the determination of the variation of free water in animal tissues; on the hydration of proteins (haemoglobin, 20%; serum albumin, 30%; serum globulin, 50%; gelatin, 60%); on the determination of the osmotic pressure of gelatin dissolved in solutions of magnesium chloride (the molecular weight of gelatin was found to be about 55,000); and on heat diffusion in gelatin gels, the results closely resembling those calculated for pure water.

The chief conclusion arrived at in the study of the transport of ham and bacon without the use of preser-

* Department of Scientific and Industrial Research, H.M. Stationery Office, 1927. Price 2s. 6d.

vatives was that fluctuations of temperature, hence of relative humidity, were the main cause of deterioration during transit. Interesting differences in the behaviour of mild and hard-cured hams on freezing were noted. The effects of freezing and thawing on gelatin gels of varying concentrations are still being examined from various angles and considerable advance has been made, particularly in relation to the freezing of beef and mutton.

Systematic work on the formation of fat by yeast has continued and the interesting observation has been made that after incubation of yeast in oxygenated glucose-phosphate solution, the amount of ergosterol (identified by Rosenheim as the precursor of vitamin D) is increased. The experiments gave an opportunity of testing whether a fatty aldehyde occurred as an intermediate substance on the path from sugar to fatty acid and the results lend support to the view that no intermediate substance containing a less number of chains is formed, such as acetaldehyde or pyruvic acid, but that a chain of six carbon atoms forms the unit for further condensation. Progress has been made with the studies of the hydration of stearolic acid, and it is already clear that, whilst the reaction leads to the production of both possible keto-stearic acids, the formation of 10-ketostearic acid is favoured. The hydration of palmitolic and behenolic acids is also being studied, and a result has been obtained with the latter which is in accord with the theory of electron-displacement.

Further work has been done on the chemistry of glycogen, though progress has been retarded owing to the difficulty of obtaining reliable glycogen in sufficient quantity. A special variety of starch is being examined and it is hoped the work may decide the question whether starch and glycogen are chemically identical or not.

The investigations on apples have led to the conclusion that apples which keep the best, contain, as a rule, the least protoplasm and the most sugar, and exhibit the lowest respiratory activity, whereas fruit which does not store well has a high content of protoplasm, relatively little sugar, and a high respiration rate. Other work related to the internal breakdown in cold-stored apples, to pectic changes in apples and pears, to the systematic analysis of apple samples, and to various other important questions in connexion with the storage and transport of fruit and vegetables.

Amongst the physico-engineering investigations, the development of a temperature-measuring outfit for marine use is recorded, and work has been done on the constancy of nickel wire resistance thermometers, on flowmeters, on the behaviour of the Venturi meter with fluids other than water, on insulating materials, and on the rate of cooling of large masses. A result of the work on humidity measurements has been the development of a new form of hygrometer, based on the principle of "fog formation" in the atmosphere when it is adiabatically expanded; the instrument is still under investigation. Experiments have been made on a compound spiral type of wet and dry-bulb hygrometer and an apparatus has been devised for making comparative tests of the resistance of insulating materials to indentation.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, will be available about the middle of August. The reprints will be in Journal format, with paper cover, and the price will be 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent at once to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

MANCHESTER SECTION

The following provisional programme for the forthcoming 1927-28 session has been issued by the Manchester Section:—On October 7, 1927—Chairman's Address—C. J. T. Cronshaw. November 4, 1927—Joint meeting of the Manchester Sections of the Society of Chemical Industry, the Institute of Chemistry, Society of Dyers' and Colourists and the Manchester Literary and Philosophical Society. December 2, 1927—Joint meeting with the Fuel Section. "Coal and co-partnership," by J. A. Bowie, M.A., D.Litt., Head of the Department of Industrial Administration, College of Technology, Manchester.

On January 6, 1928 Joint meeting with the Textile Institute. "The action of caustic alkali on partially-methylated cellulose—The heat of reaction and adsorption," by F. C. Wood, M.Sc., A.T.I., and Agnes C. Alexander, B.Sc., A.T.I. February 3, 1928—Joint meeting with the Institution of the Rubber Industry. "The influence of zinc oxide on the coefficient of vulcanisation," by S. A. Brazier, M.Sc., A.I.C., and L. R. Ridgway, Ph.D., M.Sc., A.I.C. February 17, 1928—Joint meeting with the Liverpool Section at Liverpool. Visit to the works of Bryant & May, match manufacturers. March 2, 1928—"Some industrial applications of the potentiometric and conductometric methods of analysis," by T. Callan, M.Sc., Ph.D., and S. Horobin, B.Sc., and on April 13, 1928—the Annual General Meeting of the Section, when Dr. R. H. Pickard, F.R.S., will deliver an address on "Fundamental researches in the leather industry."

CALENDAR OF FORTHCOMING EVENTS

Aug. 20. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS. Newcastle-upon-Tyne. Annual Meeting at 2.30 p.m.

Aug. 31 BRITISH ASSOCIATION FOR THE ADVANCEMENT OF to Sept. 7. SCIENCE. Annual Meeting (97th year) at Leeds.

Sept. 6 INSTITUTE OF METALS. Autumn Meeting to be held at Derby. On September 6, at 8 p.m., the Sixth Autumn Lecture on "Non-ferrous metals in modern transport," will be delivered by Dr. L. Aitchison, in the Municipal Technical College. On September 7, a general meeting of members will be held at 10 a.m., and in the afternoon, at 2.30 p.m., visits will be paid to the Carriage and

Wagon or Locomotive Works of the London, Midland and Scottish Railway Company, or Derby Crown China Works. On September 8, at 2.30 p.m., visits will be paid to the works of Messrs. Rolls-Royce, Ltd., or Messrs. Leys Malleable Castings, Ltd., or to Messrs. W. Bemrose & Sons, Ltd. (printing works). During the meeting the following papers will be read at the different sessions: "Copper-magnesium alloys. Part II," by W. T. Cook and W. R. D. Jones; "Researches on intermetallic compounds. VI. The reaction between solid magnesium and liquid tin," by W. Hume-Rothery. "Age-hardening tests with elektron alloys," by K. L. Meissner. "Equilibrium diagram of copper-tin alloys containing from 10 to 25% of tin," by A. R. Raper. "Note on cathodic disintegration as a method of etching specimens for metallography," by C. S. Smith. "Protection of aluminium and its alloys against corrosion," by H. Sutton and A. J. Sidery. "Nature of the film produced by anodic oxidation of aluminium," by H. Sutton and J. W. W. Willstrop. "Grain growth in compressed metal powder," by C. J. Smithells, W. R. Pitkin and J. W. Avery. "The undercooling of some aluminium alloys," by Marie L. V. Gayler. "Constitution of alloys of aluminium with silicon and iron," by A. G. C. Gwyer and H. W. L. Phillips. "Effect of work and annealing on the lead tin eutectic," by F. Hargreaves. "The system magnesium-cadmium," by W. Hume-Rothery and S. W. Rowell. "Constitution and physical properties of some of the alloys of copper, zinc and cadmium," by C. H. M. Jenkins.

Sept. 9. INSTITUTE OF BREWING, Research Fund Committee and Corporate Members. Visit to hop-growing districts in Kent. Luncheon will be held at Canterbury.

Sept. 12 to 14. INTERNATIONAL SOCIETY OF LEATHER TRADES' CHEMISTS. Bi-Annual Conference in London. On Sept. 12, at 10 a.m., at the Leathersellers' Hall, St. Helen's Place, E.C.3, reception of members by Prof. D. McCundlish (president), supported by the Master of the Leathersellers' Company (H. C. Dove), and the presidents of the Society of Chemical Industry, Chemical Society, Institute of Chemistry, Society of Dyers and Colourists, British Association of Chemists, and the Royal Microscopical Society. At 1 p.m., Luncheon will take place at the Connaught Rooms, Great Queen Street, W.C., by invitation of The United Tanners' Federation and The Federation of Curriers, Light Leather Tanners and Dressers. At 3 p.m. a discussion will be held of Technical Agenda. On Sept. 13, at 10 a.m., the discussion will continue, also at 2.30 p.m., and at 7 p.m., Dinner will be held at the Hotel Cecil, Strand, W.C., by invitation of the members of the British Section of the International Society of Leather Trades' Chemists. Sept. 14, at 10 a.m., the discussion of Technical Agenda will continue, and also at 2.30 p.m. The Chemical Industry Club, 2, Whitehall Court, S.W.1, has kindly granted facilities for members attending the Conference to have the use of the Club during the period of the Conference.

Sept. 14. INSTITUTION OF SANITARY ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

INSTITUTION OF CHEMICAL ENGINEERS

We are glad to print below the questions set by the Institution of Chemical Engineers at the recent examination for Associate-Membership. One question, each, from Sections A and B, had to be attempted at home. The other sections consist of the questions set in London; three hours were allowed to answer four questions in each section; and reference books were provided for use by candidates.

HOME PAPER, JUNE, 1927

SECTION A

1. Design a plant for the manufacture of 500 galls. per day of 12 vol. hydrogen peroxide. Estimate the cost of the plant and the cost of production. How does this price compare with the current price of hydrogen peroxide, taking the selling costs as 10% on the sale price?

2. Three hundred tons of gypsum, containing 75% calcium sulphate, at 5s. per ton, and 200 tons of lignite, containing 37.25% of carbon, 35% of volatile matter, 23% of moisture, 3.5% of ash and 1.25% of nitrogen, at 4s. per ton, are available per week. Iron pyrites, free from arsenic, containing 50% of sulphur, can be purchased at 7d. per unit of sulphur, delivered on the site. Limestone containing 94.5% of calcium carbonate is also available in large quantities at 6s. per ton. Prepare a report on the commercial possibilities of the materials available, and indicate what raw material, and what process, you would recommend, in the circumstances, for the production of (a) sulphuric acid and (b) commercially pure sulphur, for both of which there is an excellent demand. Give a sketch drawing, showing the general arrangement and a specification of the plant for either (a) or (b), indicating the cost of manufacture and probable profit, assuming (a) 80% sulphuric acid commands a price of £3 per ton and (b) that the price obtaining for commercially pure sulphur is £5 15s. per ton.

3. Design a plant for the production of 20,000 lbs. of sulphur trioxide per day (24 hours). The sulphur trioxide is to be used for the manufacture of oleum. Crude sulphur (sulphur content = 99%) is available.

Prepare the necessary heat balance and material flow sheets. Estimate the heat interchanging surfaces and sizes of the plant units. Prepare a specification of the plant and estimate its cost. Draw to scale a diagrammatic plan and elevation of the plant.

4. Design a plant for the manufacture of 1 ton of acetone per 24 hours from grey acetate of lime.

Make drawings of the layout and show by sketches the details of the plant.

Estimate the cost of production, taking the price of grey acetate of lime 80% at £15 per ton and current prices for the other chemicals. Assuming the selling cost to be 10% of the market price, find the market price at which the manufacture will cease to be profitable.

SECTION B

1. (a) A magma containing water, ammonium sulphate and sulphuric acid, has to be treated in a centrifuge. The sulphuric acid content of this magma is 4%; what

metal would you recommend for the construction of the centrifugal basket?

(b) Assuming the sulphate of ammonia collected in the centrifugal basket had to be treated with a weak solution of ammonium carbonate as a neutralising medium, would you still continue to use the metal recommended for (a)? If not, what metal would you suggest?

(c) Describe in detail the experiments which you would conduct in each case on the metals in order to support your recommendation.

2. The temperature of a cold storage room has to be maintained at 30° F. The area of the wall surface is 3,000 sq. ft. and the estimated average live load is 60,000 lbs. of goods entering per day (24 hours).

Assuming ammonia as the refrigerant, calculate the heat interchanging surfaces and estimate the sizes of the various plant units which will be required. Prepare a dimensioned sketch of the plant.

The following data may be assumed:—

Mean specific heat of the goods = 0.9 relative to water
 Leakage loss coefficient = 0.07 B.T.U. per sq. ft. wall surface per hour per °F.
 difference between inside temperature and outside air temperature
 Heat equivalent of the workmen, lights, conveyors, etc. = 1,000 B.T.U. per hour operating for 7 hours
 Leakage loss during loading = 8,000 B.T.U. per hour.
 Temperature of air outside = 70° F.
 Water is available at 55° F.

N.B.—Candidates are expected to calculate the duty of the compressor but not to design it.

3. The walls of a cylindrical producer, 5 ft. internal diameter by 6 ft. long, consist of a layer of firebrick 9 in. thick surrounded by a layer of sand 2 in. in thickness which is held in position by a steel casing $\frac{1}{2}$ in. in thickness. If the inner surface of the brickwork is maintained at a temperature of 650° C. and the temperature of the surroundings of the producer is 15° C., calculate the heat lost by the producer. How will this loss be altered and by how much by increasing the brickwork to 14 in.

Neglect surface resistances.

Conductivity of brickwork

0.7 cal. cu. m. °C. hr.

“ iron

58.6 “ “

“ sand

0.336 “ “

Peclet constant for iron

3.36

Heat lost by radiation etc., given by

$a(\tau_1^4 - \tau_2^4)$

$10^{-8} + b(\tau_1 - \tau_2)^{1.25}$

in kilogram cal. per sq.

per hour

where a = Peclet constant.

b = constant value 3.

τ_1 and τ_2 = absolute temperature of outer surface of producer and air respectively.

4. Blue water gas is being used by a submerged flame process for the elimination of water from activated sludge, the original water content of which is 40%. Five hundred tons of dried product, with a 5% water content, are being produced per day. For every 1,000 lb. of activated sludge evaporated, 2,000 cu. ft. of gas are used, and 350 lb. of steam, at 90 lb. absolute pressure, are available. What quantity of such steam would you set apart (1) for the generation of blue water gas, for the “run,” and (2) how would you propose to utilise the balance of the steam, assuming a large factory existed and electrical energy and light were required? Give an indication of the cost of electricity per Board of Trade Unit, assuming the surplus steam was charged to the electrical plant at 6d. per ton.

LONDON PAPERS, JULY 14 AND 15

SECTION C

1. (a) Discuss the sources of power loss in industrial plants and indicate the factors which determine the losses and the means by which these may be kept within reasonable limits.

(b) Ten thousand galls. per day (24 hours) of a liquor have to be taken from a tank 4 ft. above ground level and then to a double tube preheater discharging to an evaporator. The liquor passes through the inner tubes which are of steel and of diameter 1 in. and arranged in series in ten lengths of 6 ft. each.

The friction factor for the liquor flow in the tube may be taken as 0.006 and the specific gravity of the liquor 1.1.

The liquor is being evaporated under a pressure of 15 lbs. per sq. in. absolute.

What power would be required to deliver the liquor to the evaporator? If the supply of liquor were reduced to 50 galls. per hour, what effect would the reduction have upon the operation of the preheater?

2. A cylindrical steel vessel $\frac{1}{2}$ in. thick is homogeneously lined with lead to a thickness of $\frac{3}{8}$ in.

The inner surface of the lead is maintained at a temperature of 200° C. and the outer surface of the steel at 70° C. Calculate how much heat will be transmitted through the wall per sq. ft. per hour.

Conductivity of lead = 27.5 cal. / cu. m. / °C. / hour.

Conductivity of iron = 58.6 cal. / cu. m. / °C. / hour.

3. Ammoniacal liquor, as produced at many gasworks, can only be disposed of at a pecuniary loss. From your knowledge of the methods by which ammonia is recovered at the present time at gasworks, can you suggest any alteration or modification of existing practice which is calculated to assist gas undertakings to dispose of their ammoniacal liquor at a profit?

4. How would you propose to produce dehydrated copperas (the ferric sulphate content of which must not exceed 5%) from ordinary copperas (crude ferrous sulphate)? Discuss the merits of a vacuum heated oven, and an open cast iron pan, for the purpose in question.

5. Indicate the relative advantages and disadvantages of heating a vessel by direct exposure to a fire, by the use of a liquid such as oil and by employing superheated steam.

6. State what methods you would adopt for measuring the quantity of fluid passing in the following cases:—

(a) 2,000 cu. ft. of air per minute at 15° C. and 760 mm. passing through a 6 in. diameter pipe.

(b) 20,000 cu. ft. of air per minute at 50° C. and 760 mm. passing through a 6 in. diameter pipe.

(c) 25,000 galls. of water per hour passing through a 6 in. diameter pipe. The pipe is already assembled and cannot be dismantled.

(d) 5,000 galls. of water per hour passing through a 3 in. diameter pipe which is not yet assembled.

(e) 4,000 galls. per hour of an oil (specific gravity—0.9 and viscosity—100 relative to water) passing through a 4 in. diameter pipe.

(f) 15,000 galls. per hour of a liquid (specific gravity—1 and viscosity—1.2 relative to water) passing through a 5 in. diameter pipe. The power loss due to the flow-meter is not to exceed $\frac{1}{4}$ h.-p.

(g) 1,200 galls. per hour of cooling water required for a condenser.

7. A billet preheating furnace uses coal containing 74% of carbon, 4.8% of hydrogen and 9.4% of ash (sulphur and nitrogen can be disregarded). Assuming that 50% of excess air is employed in the combustion calculate the flue gas analysis (a) on the assumption that complete combustion is obtained, and (b) on the assumption that 10% of carbon is converted to CO only.

8. The output of caustic magnesia (MgO) from a kiln fired with powdered coal is to be 2 tons per hour. From the following data estimate the fuel requirements of the kiln.

Composition of available coal (moisture and ash free basis):

C 80%, by weight
H₂ 5.5%
O₂ 13.5%
N₂ 1%

	ash content 5% moisture content 2.5%
Net calorific value (moisture- and ash-free basis) :	13,000 B.T.U. per lb. of coal.
Temperature required for the complete dissociation of the magnesite	800° C.
.. of primary air/coal mixture fed to burner	20° C.
.. .. secondary air entering kiln at burner	300° C.
.. .. gases leaving kiln	400° C.
.. .. clinker leaving kiln	400° C.
Heat of formation of MgCO ₃ from MgO and CO ₂	390 B.T.U. per lb.
.. loss (by radiation and convection) from kiln shell	300,000 B.T.U. per hour
Specific heat of CO ₂ leaving the kiln	0.23
Mean specific heat of the gaseous products of combustion of the fuel	0.25
Specific heat of magnesite	0.22
.. .. clinker	0.28

Excess air to be used for the combustion of the fuel

30%.

Ratio primary air/total air 1/4.

The available magnesite may be assumed to be 100% MgCO₃.

9. Calculate the heat loss from the curved surface of a rectifying column of a still; air temperature 15° C.; temperature of the column 62° C. at top and 96° C. at bottom. Diameter of column 50 cm.; height 5 metres; material—copper.

10. Design a cooler for mixed gases containing 50% of steam at normal pressure and 50% non-condensable gas. The temperature of the mixed gases is 100° C. and it is necessary to cool to 20° C. 50,000 cu. ft. of the mixed gases are to be dealt with per hour. Ample cooling water is available at 15° C.

SECTION D

1. A plant is required to concentrate 2,000 galls. per hour of a 15% sugar solution to 60% concentration.

Steam is available at 5 lbs. per sq. in. gauge.

What plant would you suggest?

Calculate the heating surfaces and the lbs. of water evaporated per lb. of steam. Give a dimensioned sketch of the plant and indicate the position of any necessary auxiliary plant.

The following data may be assumed:—

Sugar Concentration. Grams per 100 grams of solution.	Elevation of Boiling Points : ° C. at 760 mm.
10	0.4
15	0.5
20	0.6
30	1.0
40	1.5
50	2.0
60	3.0

What influence would (a) the presence of permanent gases in the feed liquor, and (b) the increasing concentration of the juice have upon the design and operation of the plant?

For the purpose of this question, the elevation of the boiling point for any given concentration may be taken as independent of pressure.

2. Discuss any laws relating to the power required for the size reduction of material and state on what assumptions they are based.

Describe either a jaw crusher, gyratory crusher or disc crusher, indicating the materials used for the jaws and their method of fixing. Compare the advantages and disadvantages of each type of machine.

3. What plant would you recommend for the production of 20 tons of ammonium sulphate per day from a 30% solution of (NH₄)₂SO₄. (a) containing 2% of H₂SO₄, and (b) a neutral solution? Calculate the heat requirements and give a sketch indicating any essential accessory plant.

4. Describe, with sketches, giving the principles of operation, the type of plant which you would recommend for one of the following operations on a commercial scale:

(a) The production of "caustic" magnesite from magnesite.

(b) The combined production of a "smokeless" solid fuel and a gas of high calorific value.

(c) The production of dilute nitric acid from a mixture of oxides of nitrogen, oxygen and water vapour.

(d) The concentration of a dilute solution of NaOH.

5. What are the different methods of feed to a triple effect evaporator and what are the factors governing the selection of feed for an evaporator of this type?

How do the different methods of feed affect the steam consumption and the load upon the condenser? Are these dependent upon the inlet temperature of the feed, and, if so, in what manner?

6. What are the physico-chemical principles involved in the manufacture of sulphuric acid by the chamber process? What steps would you propose to take in order to minimise reaction space?

7. Describe machines for the continuous separation of:—

(a) An ore from its gangue.

(b) A mixture of brass and iron turnings.

(c) Two immiscible liquids having different densities.

State the fundamental principle or principles involved in each case.

8. The vapour from the last effect of an evaporator operating under vacuum amounts to 5,000 lbs. per hour.

What type of condenser would you recommend, the condensate to be used as feed water for a boiler?

If the temperature of the vapour at the inlet to the condenser were 52°C ., estimate the size of the condenser required.

The following data may be assumed :—

Latent heat at 52°C . = 567 C.H.U. per lb.

The pressure of the vapour (saturated) at 52°C . = 101.5 mm. of mercury.

Water is available at 16°C .

What would a rise in pressure in the condenser indicate and what effect would this have on the operation?

9. Describe, with sketches, the plant that you would adopt for the following grinding operations :—

(a) Sulphate to pass 90% through a 50 mesh screen ;

(b) Anhydrite, to pass 95% through a 120 mesh screen and

(c) Sulphur, to a powder for a sheep dip.

10. In a nitric acid plant, the following vapours leave the retort per hour :—

HNO_3 vap.	149 lbs.
$\text{NO}_2 + \text{O}_2$	27 lbs.
H_2O	7 lbs.

State the type of plant which you would recommend for condensing the vapours, assuming the whole of the $\text{NO}_2 + \text{O}_2$ passes to the absorbers and estimate the surface required for the plant which you propose.

For the purpose of this question, the following data may be assumed :—

The latent heat of vaporisation of HNO_3 = 7250 gram calories per gram molecule.

The heat of solution in kilogram cal. of 1 gram molecule of HNO_3 in M gram molecules of H_2O is as follows :—

M gram molecules of water	0.5	1	1.5	2	2.5
Heat of solution	2.0	3.29	4.16	4.86	5.27

Assume overall heat transmission coefficient in the condenser = 73 kilogram cal./sq. m./ $^{\circ}\text{C}$ /hour.

SECTION E

1. *Compulsory*.—Indicate in EIGHT only of the following cases :—

I. The materials you would employ in the construction of plants for the following purposes under industrial conditions.

II. The type of construction.

III. Any special precautions necessary.

(a) The transport of liquid chlorine by rail.

(b) The storage of acetylene.

(c) The manufacture of "iron free" salt cake.

(d) The production of a nitro-amino compound (which must be free from metallic impurities) from the corresponding nitrochlor hydrocarbon.

(e) The purification of the mixed vapours and gases from a pyrites burner.

(f) The distillation of coal at low temperatures.

(g) The condensation and cooling of pure acetic acid.

(h) The nitration of toluene.

(i) The storage of hydrochloric acid.

(j) The production from salt cake of crude sodium carbonate.

(k) The transport of anhydrous ammonia.

(l) The filtration of aluminium hydrate.

2. Write an essay on one of the following as constructional materials and the chief uses, mentioning the chemical, physical and mechanical questions which are involved :—

(a) Concrete.

(b) Alloys containing nickel.

(c) Alloys containing silicon.

3. Write a short essay on the use of paint as a protection for iron or steel. State briefly the composition of paints used for this purpose.

4. Discuss the factors governing the choice of refractory bricks for the construction of a reverberatory furnace to roast sodium sulphate with anthracite duff, for the manufacture of sodium sulphide.

5. What are the relative advantages and disadvantages of copper and aluminium as constructional materials for chemical plants?

6. Discuss the effect of heat upon the properties of metals and mention how the effect may influence the design of plant.

7. What are the difficulties likely to be encountered in the evaporation of a solution of ammonium chloride, from the point of view of materials of construction : what type of plant would you recommend, and of what materials should it be constructed?

8. Describe how you would attach a soft rubber lining to a steel tank. If the tank consisted of a railway wagon for the transport of hydrochloric acid, could you use an ebonite lining? Give a reason for your answer.

9. Would you employ the same quality of lead for a sulphuric acid concentration pan as you would for the construction of a sulphuric acid chamber? Give reasons for your answer and state whether you prefer Pattisonian refined lead or lead refined by the Parkes process.

10. Describe the operations which are employed in the following cases :—

(a) Production of metal castings.

(b) Joining of sheets of the metals - steel, copper, lead and aluminium.

(c) Jointing pipe lines for carrying—

(i) Ammonia gas under pressure, and

(ii) Nitric acid vapours.

SECTION F

1. What are the chief factors which influence the choice of prime movers for electric generators? The following results were obtained during a test on a gas engine driving a dynamo :—

No. of strokes per min.,	98
Mean effective pressure,	59.4 lb. per sq. in.
Area of cross section of cylinder,	44 sq. ins
Length of stroke,	15 ins.
Average gas consumed,	2.3 cub. ft. per min.
Mean temperature of gas at meter,	13°C
" pressure	3.8 in. of water gauge.
Barometer reading,	29.2 ins. of mercury
Average water to cooling jackets,	8 lb. per min.
" temperature of cooling water at inlet,	19°C
" " " outlet,	48°C .
Calorific value of gas,	400 B.T.U. per cub. ft. at 0°C . and 760 mm.
Average output of dynamo	{ Volts 220
	{ Amperes 20.5
Loss of power in engine friction,	20%.
" " " belt drive,	1 h.p.

Prepare a report on the performance of the gas engine

and the dynamo. What is the overall efficiency of the plant?

2. How would you propose to light a factory in which naphtha is distilled? What precautionary measures would you take against fire?

3. Assuming Bernoulli's theorem, deduce an equation giving the volume in cubic feet per second flowing through a Venturi meter and apply the formula to the following problem.

In a 12 in. Venturi meter the throat is 4 ins. diam. Taking the constant of the instrument as 0.982, determine the difference of head at the entrance and throat when discharging (a) 100, (b) 500, and (c) 1,000 gallons of water per minute.

4. Outline the type of cost sheet which you would adopt in connection with the process for the production of electrolytic caustic soda, where (a) the weak solution is evaporated and sold as solid caustic soda; (b) where the chlorine is used in the manufacture of bleaching powder; and (c) where the hydrogen is collected and filled into cylinders under pressure.

5. 1,000 cub. ft. per hour (measured at 15° C. and 760 mm.) of dry hydrogen have to be supplied to a reaction vessel operating under a pressure of 200 atmospheres.

Describe the type of apparatus which you would use, and estimate the power required. What would be the heat produced? What would be the effect of cooling the compressor with (a) running water, and (b) still air?

6. 6,000,000 cub. ft. per day of coke oven gas are available 10 miles from a city. (a) How would you suggest disposing of this gas? (b) What arrangement would you make? (c) How would you propose to ensure continuity of supplies? In whatever form you recommend the gas should be used, indicate the kind of distribution system you would provide.

7. Calculate the thickness of the cylinder for a hydraulic accumulator with a ram 12 ins. in diameter to supply water at a pressure of 2,000 lbs. per sq. in. Take the internal diameter of the cylinder as 15 ins. Find the total weight which must be applied to the ram to maintain this pressure. Give dimensioned sketches and show the type of packing you would employ. Take the safe tensile stress for the material as 10,000 lbs. per sq. in.

8. Discuss the effect on the composition of the gas from a producer supplied originally with air of:-

- (a) Admitting steam with the air blast.
- (b) Reducing the depth of the fuel bed.

9. If in a boiler plant the steam output fell below that guaranteed by the makers of the boilers, what equipment would you purchase and how would you install and use it to determine and, if possible, increase the efficiency of the boiler house?

10. Indicate the design and general arrangement of a plant for the manufacture of calcium superphosphate, bearing in mind that the product has to meet severe competition. Discuss the essential factors which lead you to recommend such a design and general arrangement.

CORRESPONDENCE

THE COLLEGE MAN AND CHEMICAL INDUSTRY

SIR,—Some time ago there was a discussion in your columns on the question as to whether college men were wanted in the chemical industry. I considered it rather futile at the time because there can only be one answer, viz., that chemical industry simply cannot get on without college men. It is true that the discussion rightly took the line that there was something wrong with the "type" at present being turned out, but it was noteworthy in this particular discussion as also in many others on the same topic, that the Industrialist has had very little to say; broadly speaking, the academic man hitherto has done most of the talking and writing. Now this is not as it should be. It is time that the few industrialists who can speak with authority came out into the open and gave a lead to the universities and technical colleges and I hope that they will do so. I cannot speak for them (the industrialists), but I do happen to know that my views are shared by at least some of them, and after all I have had some little experience both of the academic and the industrial side of chemistry.

The raw material for all the profession—the young man of matriculation age—is much the same, whether he sets out to be an engineer or a chemist. Yet when he has taken his degree and goes out into the world to earn his livelihood—for professions are, after all, decided upon as a means of earning one's livelihood—there is a subtle, but very definite difference between the engineer and the chemist. What that is is hard to define, but most people are perfectly aware of its existence. Broadly speaking, the chemist is rather academic and impractical, and it is not easy, therefore, to fit him into a works organisation. Moreover, he has quite a good idea of his own importance, which does not help matters at all. Even to-day he finds it very difficult to combine with his fellow chemists, so that there is now no one organisation which by general consent speaks for chemists as a whole.

I do not suppose for one moment that the foregoing diagnosis will be generally accepted, but whether it is or not, it is a fact that until quite recently very few of the important administrative positions in the world of industrial chemistry were held by chemists. Among chemical merchants, chemists are practically unknown and there was and is not to-day the equivalent of the commercial engineer.

Assuming for the moment that this diagnosis of a very complicated state of affairs is fairly accurate, and it cannot be far out because there are many nostrums for improving the chemist and his lot, ranging from the study of engineering and economics to a more intensive study of chemistry by means of post graduate specialisation and research. All of these are good, but life is so short and for most students the position after four years' study is largely governed by economics.

Now, I am free to admit that there is no exact comparison between the chemist on one side and the engineer on the other. Moreover, the chemical horizon is becoming wider every day and we may have to visualise the possibility of early specialisation, but, broadly speaking, something happens to most chemists during their four years of training which makes them different, certainly from engineers. What then causes this difference?

To my mind it is caused very largely by the teachers and more particularly their method of teaching chemistry. A certain proportion of research men must always find their avocation in industry, but I have a clear impression that the teachers as a body concentrate too much on this particular aspect of study and less on the economics of everyday chemical industry. After all, the chemist, if he is to be of any use at all in a works, must realise the importance of losses, yields, purity, maintenance and overhead charges—even though he is only running his laboratory. It is easy to instil these ideas even when teaching, but it is difficult if their importance is not realised by the teacher.

I suggest, therefore, that far too few of our professors have been through the mill and that as a consequence the teaching of chemistry has become much too academic. Even though a large body of opinion is with me in voicing this heresy it will be very difficult to put things right, but it is impossible even to make a start unless the leading industrialists speak out in no uncertain tones. In the meantime it would do every chemist an infinity of good if, as a part of his course, he had to fire a retort or a boiler for two months, or work the ordinary chemical labourer's shift in a works for the same period. He would learn something, probably not a lot, but the psychological effect would certainly be wonderful.

I am, Sir, etc.

WILLIAM CULLEN

A LONDON INSTRUMENT MAKER

SIR.—It is generally admitted that there are few finer craftsmen than the London instrument maker. As employers, therefore, we regret to find a Continental origin ascribed to any of his products.

Since 1849, when the late Mr. L. Oertling settled in London and commenced business as a builder of precision balances, instruments have born the mark "L. Oertling—London," which has, in fact, become known throughout the world as denoting the highest grade of workmanship in this very specialised field.

It is easily understood that the name might suggest to some a foreign origin; but the truth is that this has never been a foreign firm with a London address, or a firm importing foreign balances, or parts for erection here.

Every "Oertling" balance has been built throughout in London; and, since we find misapprehensions on this point, we wish to stress that our output is entirely British—the product of British brains, British craftsmen, and British capital.

Yours faithfully

(for L. Oertling, Ltd.),

MALCOLM DUNBAR,

Director

PERSONAL AND OTHER ITEMS

Sir Hugh K. Anderson (Master of Gonville and Caius College, Cambridge) and Professor T. R. Elliott (director of the medical unit, University College Hospital, London), have been appointed members of the Medical Research Council, to fill the vacancies caused by the retirement of Sir Frederick Andrewes and Sir Cuthbert Wallace.

In order to give two more delegates an opportunity of attending the forthcoming Empire Mining and Metallurgical Congress in Canada, Sir Robert Hadfield placed two travelling scholarships at the disposal of the Iron and Steel Institute and the Institution of Mining and Metallurgy. The former has nominated Miss C. F. Elam, D.Sc., and the latter Prof. B. W. Holman, O.B.E., both at the Royal School of Mines, South Kensington, and on July 25 they paid a visit to East Hecla Works. This public-spirited action of Sir Robert Hadfield will be much appreciated.

Dr. E. R. Weidlein, director of the Mellon Institute of Industrial Research of the University of Pittsburgh and president of the American Institute of Chemical Engineers, will be in Europe during September and October. Dr. Weidlein, who will visit educational institutions, research laboratories and chemical works and will discuss problems in industrial research organisation with various authorities, expects to be in England during September 11 to 24, and may be addressed—c/o The Old Colony Club, 79, Fore Street, London.

Dr. G. Korte has succeeded the late Dr. Kempner as chairman of the German Potash Syndicate. Dr. Zirkler has become chairman of the Potash Council.

Helmuth F. Manske, Ph.D. (Manchester), B.Sc. (Queen's, Ont.), has been awarded the Lilly research fellowship, valued at \$3000, at Yale University.

Blythe A. Eagles, B.A. (B.C.), has been awarded a Sterling fellowship, valued at \$600, at Yale University.

The death is announced of Mr. J. J. Wooler, a director of the Bleachers' Association, Ltd.

The death is announced, at Haybridge Hall, Hadley, near Wellington, of Col. James Patchett, J.P., D.L., Chairman and Managing Director of the Shropshire Iron Co., Ltd., Director of the Union Steel Corporation (of South Africa), and of other companies. He had been a member of the Society of Chemical Industry since 1897.

We regret to learn of the death, through a motor accident, of Mr. C. R. Timmings, process manager of the Thornton works of the United Alkali Company.

Medal for Agricultural Research

A silver medal is being offered by the Royal Agricultural Society for a monograph or essay giving evidence of original research on any agricultural subject, on any of the cognate agricultural sciences, or on agricultural economics. Candidates for the medal must reside in Great Britain or Ireland and must not be more than 30 years of age on September 29, 1927, and the monograph or essay must be forwarded to the Secretary of the Royal Agricultural Society on or before October 31.

Scientific Management of Industry

The third International Congress of Scientific Management will meet in Rome at the International Institute of Agriculture from September 5 to 8, when the following problems connected with scientific management will be discussed:—Industries and trade in industrial products; agriculture and trade in soil products; public services and public utilities; and domestic economies. These

subjects will be dealt with by four separate sections, and the conclusions arrived at will be submitted to a final meeting of the congress as a whole. The congress will also deal with such questions as maximum production; factory layouts; labour-saving devices; time-studies and administration systems, for public authorities as well as manufacturing units. The subscription fee to the congress is nominal, and persons attending may send in papers on the subjects under discussion, preferably dealing with practical cases and results obtained from the application of the principles of scientific management. Papers, subscription forms, etc., should reach the organisers, E.N.I.O.S. (Ente Nazionale Italiano per l'Organizzazione Scientifica del Lavoro), Piazza Venezia, 11, Rome, as soon as possible.

The French and Italian railways are making 50% reduction on tickets for members of the congress, and hotels have considerably reduced their normal charges. Further information can be obtained direct from the address given above, or through the Production Department of the Federation of British Industries, 39, St. James's Street, London.

Canadian Chemical Industry

The annual report for 1926 of the chemical group of industries, issued by the Dominion Bureau of Statistics, shows an increase of \$7,500,000 in value over the preceding year. Capital increased by \$6,000,000, whilst the number employed increased from 13,951 to 14,313; salaries and wages from \$17,169,157 to \$18,158,614; and materials used cost \$59,756,675, or about \$3,500,000 more than 1925. There was a slight increase of \$319,622 in value of the output of coal-tar and products; the acids, alkalis, salts, and compressed gases division showed an increase of \$1,231,000; explosives, ammunition, fireworks and matches, as a division, remained stationary, although explosives showed an increase in output and value; there was a slight improved value of output of complete fertilisers; medicinal and pharmaceutical preparations increased by \$1,160,000; paints, pigments, and varnishes advanced by \$2,468,317; soaps and washing compounds increased by \$1,152,000; inks, dyes, and colours increased by \$51,064; wood distillates and extracts declined by \$245,003, and miscellaneous chemical products increased by \$893,194 in value of output - all as compared with the preceding year. The total value of the products of these divisions was \$120,369,518, as against \$112,906,746 in 1925.

Activated Carbon Agreement

An agreement is reported to have been made between the Société des Charbons Actifs Urbain, of Paris, and the German Carbo-Union (controlled by the I. G. Farbenindustrie A.-G. and the Metallbank), providing for exchange of patents relating to activated carbons.

The I. G. and The Standard Oil Co.

It is reported that an agreement has been made between the Interessen-Gemeinschaft Farbenindustrie, represented by the Director-General, Herr Bosch, and other officials, and the Standard Oil Company, represented by the president of the company, Mr. W. Teagle, providing for the joint exchange of technical information and for co-operation in various respects between the two concerns. The object of the agreement is the joint

exploitation of a high-pressure process for refining crude oils which are ordinarily difficult to deal with. This process of the I. G. is at present only in the laboratory stage. No formal agreement was, it is believed, arrived at on the question of markets for products from the liquefaction of coal, as the I. G. synthetic motor fuel is not yet on the market. Subsequent co-operation from England and from France is, for this reason, considered likely in some quarters. When the synthetic fuel is ready it will be marketed by the German Petrol Company, of which half the shares is controlled by the I. G., and one-quarter each by the Standard Oil and Shell companies.

Artificial Silk in Germany

The Vereinigte Glanzstoff-Fabriken A.-G., Elberfeld, proposes to increase its ordinary share capital from 42 to 60 million marks and to issue 300,000 marks of new preference shares. The I.P. Bemberg A.-G., Barmen, is also increasing its capital from 16 to 28 million marks, of which 8 million marks are to be used with a view to extending and strengthening the existing community of interest associations. It is probable that the Vereinigte Glanzstoff-Fabriken A.-G. will require further funds in connexion with the construction or extension of new factories. It is already participating with Courtaulds, Ltd., in the erection of a big factory near Cologne, which is expected to start production, estimated at 3,000,000 kg. per annum, in the coming autumn. Another existing factory has also recently been acquired by the company, together with the Dutch Enka, while the factory of the Aceta, in which the Elberfeld concern has a part interest, will reach full capacity towards the end of the year.

The German Nitrogen Industry

Hitherto the German Potash Syndicate, according to the *Financial Times*, has been selling fixed nitrogen produced chiefly by the I. G., but reports from Berlin state it will probably market fixed nitrogen from plants at the Mont Cenis and Hibernia collieries, which are to begin producing at the rate of 9000 tons each a month. In 1925-26, the Potash Syndicate sold the equivalent of some 325,000 tons of nitrogen, and sales for the current year are estimated at 390,000 tons. As the additional output from the Mont Cenis and Hibernia collieries will total 216,000 tons per annum, the sales of I. G. fixed nitrogen by the syndicate would be considerably reduced. It is pointed out that the I. G. could easily reduce prices, as the cost of production is about 7½d. per kg. compared with a sale price of about 1s. per kg.

New Remedy for Leprosy

A new metallo-organic preparation for use in treating leprosy consists of a solution of 2-myristo-oxymethyl-3-oxybenzaldehyde in hydrocarpus oil. The new preparation, sold under the name of "Avenyl," is, it is stated, not poisonous, is free from the disadvantages of arsenic compounds, and is applied subcutaneously.

Titanium White

A controlling interest in the Titan Company of Frederikstad, Norway, has been acquired by the National Lead Company (U.S.A.), which controls the Titanium Pigments Company, of Niagara Falls.

REVIEWS

THE PRODUCTION OF COTTON. By Dr. H. G. COLLINGS. Pp. xi+256. The Wiley Agricultural Series, edited by J. G. Lipman, B.Sc., A.M., Ph.D., D.Sc. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1926. Price 17s. 6d.

This is an excellent book, well illustrated, and concisely yet interestingly written. The selection of material and its well-balanced presentation are obviously the product of a well-informed and orderly mind.

Written primarily for agricultural students and workers in America, the book deals with the growth of cotton from the time of preparation of the soil for planting till the harvesting, ginning and baling of the ripened cotton for transport to manufacturing areas. Climatic and soil conditions which affect the growth of cotton are fully dealt with. Much valuable information is given relating to the botanical characteristics, morphology and breeding of cotton, and the uses of such by-products as cottonseed meal and cottonseed oil receive adequate attention. A particularly interesting part of the book deals with the successful struggle of cotton planters against the various diseases and insect pests to which cotton is liable, the help which science is able to give in this direction being clearly indicated. It is important to remember that practically the whole of the book is devoted to cotton growing as carried out in America.

Perhaps the least satisfactory portion of the book is that relating to the growth and fine structure of cotton hairs within the bolls. This portion is much too compressed, and indeed certain valuable information is omitted. Cotton is grown only because it is one of the most important textile fibres, and for this reason both producer and user alike are vitally concerned with the physical and chemical characteristics of cotton hairs. It is desirable that future editions should give the reader the clearest possible presentation of all the growth factors which affect cotton hairs and their value in subsequent textile manufacture.

This book will be found extremely valuable by all concerned with the growth of cotton, while it is not less interesting to all those associated with the conversion of cotton into yarns and fabrics. A. J. HALL

LUBRICATION AND LUBRICANTS. By LEONARD ARCHBUTT, F.I.C., F.C.S., and R. MOUNTFORD DEELEY, M.Inst.C.E., M.I.Mech.E. Fifth edition, revised, enlarged, and reset. Pp. xxxii+650. London: Charles Griffin & Co., Ltd., 1927. Price 36s.

The last revision of this book took place in 1912 when the third edition was published, and consequently a large amount of new material has been available for the present (the fifth) edition. The authors have received the assistance of numerous other authorities on lubrication in the preparation of several of the sections.

Since the last edition a great deal of work has been published on the subject of oiliness and a considerable portion of the book is now given over to the theory of friction, all the recent work on this subject having been carefully reviewed and abstracted, making this one of the strongest sections of the book. The sources, pre-

paration and properties of lubricants are treated briefly, but some of the newest and most important developments in the preparation of lubricants appear to have been overlooked. Such processes as the Sharples "Bright Stock" and the Sharples "Long Residuum" processes, which account for a very large proportion of the world's lubricating oils at the present time, and also the contact clay filtration process, which has almost entirely superseded other methods of refining for the production of lubricants, have been either overlooked or received very scanty attention.

An excellent and very detailed section treats the subject of viscometry, all known methods of obtaining absolute viscosity in addition to the commercial viscometers being described. Numerous viscosity-temperature graphs are given in each case, the viscosity being plotted directly in absolute units, not as the logarithm of the absolute viscosity, a system which has much to be said in its favour. A full description is given of the methods of analysis recommended by the Institution of Petroleum Technologists as well as American and other methods.

Both physical and chemical testing of mineral and saponifiable oils is dealt with in great detail. There is also a large amount of space given to the subject of friction testing machines and to the appliances used for lubrication. One cannot help thinking that some of the space given to details of lubricating appliances might have been more profitably employed in other ways.

A section one would consider to be of prime importance, that is the portion of the book describing the nature of the oils to be used for various types of engines and machinery, receives remarkably little space; for example, the lubrication of all types of engines and mechanical appliances only receives some 20 pages in a book containing over 600 pages, and some of the material in this section is far removed from the modern practice. For example, for the lubrication of clocks, watches and other delicate mechanism, several oils are recommended, but the type of oil which is mainly used for this purpose at the present time, that is to say a white mineral oil of the transformer oil type, is not mentioned. A large proportion of the oils nowadays used for turbine lubrication are below the viscosity range mentioned under this heading. One would have expected some guidance as to the nature of the base oils to be employed for various purposes with recommendations as to the relative values of asphalt base, naphthene base and paraffin base mineral lubricants for the various services, but very little information is forthcoming on this subject.

The lubrication of motor cars only receives one-third of a page, a surprisingly small amount of attention, considering that the motor car consumes a greater quantity of lubricating oil than any other form of machinery. Aircraft engines are dispatched in one line. There is no doubt that this section is weak, considering the detail with which other and less important matters are treated.

The book contains much very valuable information, and will prove of great value to every student of lubrication.

H. MOORE

COMPANY NEWS

BRADFORD DYERS' ASSOCIATION

An interim dividend of 1s. per share, subject to tax, is to be paid on the ordinary capital of £2,170,363.

CHEMICAL AND INSULATING CO.

This company was registered on August 3 with a nominal capital of £100,000, in £1 shares, to carry on the business of manufacturing, wholesale and retail chemists and manufacturers of and dealers in articles and materials capable of being used for insulation or protection, packing, jointing or lining, and articles and materials composed of magnesite or asbestos. The subscribers are J. Campbell and P. W. Campbell, and the registered office is at Cockerton, Darlington.

FORSTER'S GLASS COMPANY

The eighth annual general meeting was held on July 28, Sir Sydney H. H. Henn, M.P., the vice-chairman, presiding. After speaking with regret of Mr. John Forster's declining health he said the company's loss through the coal strike amounted to £40,000, resulting from the use of foreign coal, increased cost of chemicals, electricity, gas, etc. The results, such as they were, had only been obtained by great improvements and developments in the works, and by the consequent reduction in the cost of production. The demand for the company's goods during the first three months of the present financial year had kept rather quiet, possibly owing to the decreased purchasing power of the general public, and as a result there had been a great deal of price-cutting by manufacturers to contend with, as well as the usual foreign competition. All the plant and machinery had been maintained and improved on the most modern lines. It was not yet possible to pay a dividend on the cumulative participating preference shares, or to put forward any proposals at present to deal with the accumulated arrears of dividend on those shares. This decision agreed with the best financial advice that they had been able to obtain. The report was approved and adopted. The retiring director, Sir Sydney Henn, K.B.E., M.P., was re-elected.

INDESTRUCTIBLE PAINT AND STANDARD VARNISH CO., LTD.

It is announced that no interim dividend will be paid this year. The company, which has an issued capital of £75,000, paid an interim in August, 1926, of 5th p.

BENN BROTHERS, LTD.

The annual general meeting was held on August 4, Sir Ernest J. P. Benn, Bt., C.B.E. (chairman) presiding. In moving the adoption of the report and accounts (cf. *Chem. and Ind.*, August 5, 1927, p. 712), Sir Ernest Benn said that although the annual improvement had been reduced to a relatively small amount, the accounts showed a better figure than ever. Goodwill and copyrights stood at a figure which was very little more than the annual trading profit of the company. The £57,286 which had been invested in subsidiary and other companies was, except for one or two very small sums, employed in the most successful book publishing enterprise of recent times. The board had decided to take what he hoped would be only the first step towards

making the nominal capital of the company approximate more nearly to the actual value of their property. After 31 years of saving, the reserve account had reached a total of £87,000. The carry-forward—£18,756—was by far the largest the company had ever had. As to trade during the year, they had had more than their share of difficulties. Notwithstanding this, their advertising revenues again constituted a record. Speaking of the burden of taxation, Sir Ernest Benn said that the State took out of their enterprise three or four times as much as the shareholders. They were frequently criticised because of the price of books, but in his view the present price of books, which was far too high, was composed half of books and half of taxation. The reports and accounts were adopted and the dividend as recommended was declared. At an extraordinary general meeting which followed, resolutions were passed for the capitalisation of £70,715, of the reserve account, and for the increase of the capital of the company to £250,000. At the annual meeting, the shareholders congratulated Sir Ernest Benn, the chairman of the company, on the approaching celebration of his silver wedding, and asked his acceptance of his portrait.

STANDARD AMMONIA COMPANY

The Standard Ammonia Company was registered on July 22 with a nominal capital of £50,000, in £1 shares, for the purpose of adopting an agreement with the Standard Ammonia Company and its liquidator, and to carry on the business of wholesale and retail dealers in chemical substances of all kinds, chemical refiners and manufacturers, manufacturing chemists, artificial fertiliser manufacturers and dealers, etc. The directors of the company are F. Lennard (chairman), C. Page, F. L. F. Lennard, W. L. A. Lennard, and E. S. Lennard.

STANDARD CHEMICAL CO.

The trading profits for the year to March 31, 1927, were \$194,979, compared with \$34,835 for 1926, the net profits being \$4,676, after deducting \$30,303 for interest and \$160,000 for depreciation. Total sales amounted to \$1,634,657, an increase of \$117,262.

RECKITT AND SONS, LTD.

A dividend has been declared of 9d. per share, less tax, on the ordinary shares.

RAYSHEEN, LTD.

The second ordinary general meeting, held on April 22, was presided over by the chairman, Sir Charles H. Wilson, LL.D., J.P., M.P., who said that the company had not yet had a trading period, and therefore no attempt had been made to write off such items as preliminary expenses, etc. The plant was now running and almost completed, and would be taken over from the makers as soon as the terms of the contract with them as to quality and quantity had been satisfied. The union of the company's yarn with linen, shown at the recent exhibition where the company's products attracted a good deal of attention, gave equal satisfaction to the weaver, and the directors were convinced that this product would find a ready market. An extraordinary general meeting followed, at which a resolution was passed to change the name of the company from Raysheen, Ltd., to Sunsheen, Ltd.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, curr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.

Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Grey, £15 per ton. Liquor, 9d. per gal. 32° Tw.
 Charcoal.—£6—£9 per ton, according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s.—4s. 1d. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4 10s.—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 6d.—2s. 8d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 1½d.—2s. 3d. per gal. Pale, 95%, 2s.—2s. 1½d. per gal. Dark, 1s. 9d.—1s. 10d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 10d.—10½d. per gal., ex works in tank wagons; Standard motor, 1s. 3d.—1s. 3½d. per gal., ex works in tank wagons; Pure, 1s. 6d.—1s. 7d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 9d. per gal. Pure, 1s. 7d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Standard specification, 7½d.—7½d. per gal. Middle Oil, 9d.—10d. per gal. Heavy, 8½d.—8½d. per gal. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/100, 1s. 2d.—1s. 4d. per gal. Solvent 95/100, 1s. 4d.—1s. 5d. per gal. Solvent 90/100, 1s.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—88s. 9d.—92s. 6d. per ton, f.o.b. according to district. Nominal.
 Pyridine.—90/140.—5s. 9d.—7s. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. 3d. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzdine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene. 60/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 8d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£30 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 5d.—2s. 6d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—5 cwt. lots. Cryst. 41s. per cwt. Powder 45s. per cwt. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 7½d.—1s. 8d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 3½d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 9d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzophenone.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—5 cwt. lots. Crystal 25s. per cwt. Powder 27s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 4d. per lb. Potassium.—1s. 11d. per lb. Sodium.—2s. 2d. per lb. Granulated ½d. per lb. less. All spot.
 Calcium Lactate.—1s. 2½d.—1s. 3½d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730.—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—1 lb., 16s. per doz.; ½ lb., 9s. 6d. per doz.; ¼ lb., 6s. 6d. per doz.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 20s.—22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 10s. 6d.—14s. 6d. per lb., according to quantity; Liquid (95%), 12s. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonat.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb.
 Potass. Metabisulphite.—8d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911.—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. *consignee's station in 1-cwt. kegs.*
Sod. Nitroprusside.—16s. per lb.
Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
Sod. Salicylate.—Powder, 1s. 9d.—1s. 10d. per lb. Crystal, 1s. 10d.—1s. 11d. per lb.
Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
Sulphonal.—6s. 6d.—6s. 9d. per lb.
Tartar Emetic B.P. cryst. or powder.—2s.—2s. 2d. per lb.
Thymol, Puriss.—10s. 6d.—11s. 6d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
Aubepine (*ex Anethole*).—10s. 6d. per lb.
Amyl Acetate.—2s. per lb. **Amyl Butyrate.**—5s. 3d. per lb.
Amyl Salicylate.—3s. per lb.
Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. **Benzyl Alcohol free from Chlorine.**—2s. per lb.
Benzaldehyde free from Chlorine.—2s. 6d. per lb. **Benzyl Benzoate.**—2s. 6d. per lb.
Cinnamic Aldehyde.—Natural, 17s. per lb.
Coumarin.—10s. per lb.
Citronellol.—13s. 9d. per lb.
Citral.—8s. 6d. per lb.
Ethyl Cinnamate.—6s. 6d. per lb.
Ethyl Phthalate.—2s. 9d. per lb.
Eugenol.—8s. 6d. per lb. **Geraniol** (Palmarosa).—18s. 6d. per lb. **Geraniol.**—6s. 6d.—10s. per lb. **Heliotropine.**—4s. 9d. per lb. **Iso Eugenol.**—13s. 6d. per lb. **Linalol.**—(*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb. **Linalyl Acetate.**—(*ex Bois de Rose*) 18s. 6d. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.
Methyl Anthranilate.—8s. 6d. per lb.
Methyl Benzoate.—4s. per lb.
Musk Ketone.—35s. per lb.
Musk Xylol.—8s. 6d. per lb.
Nerolin.—4s. 6d. per lb.
Phenyl Ethyl Acetate.—12s. per lb.
Phenyl Ethyl Alcohol.—10s. 6d. per lb.
Rhodinol.—32s. 6d. per lb. **Safrol.**—1s. 6d. per lb. **Terpineol.**—1s. 8d. per lb. **Vanilin.**—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. **Anise.**—3s. per lb. **Bergamot**—28s. per lb. **Bourbon Geranium.**—14s. 6d. per lb.
Camphor.—70s. per cwt. **Cananga, Java,** 26s. per lb.
Cassia, 80/85%.—7s. 6d. per lb. **Cinnamon, Leaf.**—6d. per oz. **Citronella.**—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. **Clove, pure.**—6s. per lb.
Eucalyptus, 75/80%.—2s. 3d. per lb. **Lavender.**—Mont Blanc 38/40%, 22s. 6d. per lb. **Lemon.**—8s. per lb. **Lemon-grass.**—4s. 6d. per lb. **Orange, Sweet.**—10s. 6d. per lb.
Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz. **Palma Rosa.**—10s. 6d. per lb. **Peppermint.**—Wayne County, 17s. per lb. **Japanese,** 8s. per lb. **Petitgrain.**—7s. 9d. per lb. **Sandalwood.**—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Oct. 4th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on August 14th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Akt. Ljungströms Angturbin. Heat exchangers. July 25. (Swed., 31.7.26.)

Bisch. Continuous kilns. July 29. (Fr., 6.8.26.)
Blair, and Sunderland Forge & Eng. Co. Centrifugal separators. July 26.
Blamey. Separation of materials of different specific gravity. July 29.
British Thomson-Houston Co., Ltd. Depositing emulsified solids. July 26. (U.S., 16.8.26.)
Dunlop Rubber Co., Ltd., Chapman, and McKay. Deposition of organic materials from aqueous dispersions. July 25.
Godel. Separation of gases and vapours. July 25.
I. G. Farbenind. Catalytic gas reactions. July 25. (Ger., 24.7.26.)
I. G. Farbenind. Supplying heat in high-pressure reactions. July 28. (Ger., 28.7.26.)
Maschinenfabr. Grevenbroich. Drying apparatus. July 27. (Ger., 27.7.26.)
Morgan. Heaters or retorts. July 28.
Morgan. Forming agglomerates etc. from pulverised materials. July 29.
Mulot. Filtering apparatus for gases. July 26. (Fr., 18.6.27.)
Russell and Thynne. Furnaces. July 30.
Seavia. Distillation process. July 26.

II.—Complete Specifications

11,462 (1926) and 5479 (1927). **Raw.** Separation of solid materials of different specific gravities. (274,587.)
 14,072 (1926). **British Dyestuffs Corp., Baddiley, and Chapman.** See I.
 1899 (1927). **Smallwood and Fallon.** Furnaces. (274,730.)
 8303 (1927). **I. G. Farbenind.** Drying agent for gases. (272,173.)
 13,363 (1927). **Dörsting.** Roller mills. (274,784.)
 14,212 (1927). **Kordt.** Grinding bodies for ball-, drum-, and tube-mills. (274,786.)
 *14,873 (1927). **Soc. Anon. des Charbons Actifs.** Analysis of a mixture of gases or of vapours. (274,826.)
 *17,389 (1927). **Electrolux Ltd.** Condensation of gases or vapours. (274,840.)
 *18,490 (1927). **Soc. Internat. des Proc. Prod'homme-Houdry.** Treatment of compounds or gases by gaseous agents. (274,846.)
 *19,289 (1927). **Meyerhofer.** Continuous conversion of solids, solutions and gases. (274,881.)
 *19,679 (1927). **I. G. Farbenind.** Catalytic gas reactions. (274,904.)

II.—Applications

Anderson. Distilling carbonaceous material. July 25.
Broué and Strevena. Hydrogenation of shales. July 26.
Calcott, Lorrman, and Parmelee. 19,868. See XX.
Kelly. Treating coal, peat, etc. July 29.
McLuckie, and Oldham & Sons. Apparatus for detecting etc. presence of explosive gas. July 25.
Oswald. 19,907. See XI.
Wildish. Treatment of oil fuel refuse. July 28.
Wisner. Coal ball manufacture. July 25. (U.S., 7.8.26.)

II.—Complete Specifications

7676 (1926). **Bone, and Wilson Bros. Bobbin Co., Ltd.** Production of active carbon. (274,538.)
 7804 and 13,259 (1926). **Testrup, Boberg, and Techno-Chemical Laboratories, Ltd.** Treating bituminous and like materials. (274,540.)
 10,809 (1926). **Potts (Canada Carbide Co., Ltd.).** Dissociation of carbonaceous gases or vapours. (274,573.)
 13,935 (1926). **Casale.** Preparation of mixtures of carbon monoxide and hydrogen from hydrocarbons. (274,610.)
 19,431 (1926). **Simon-Carves, Ltd., and Brown.** Regenerative coke ovens. (274,653.)
 22,048 (1926). **Plassmann.** Low-temperature distillation or coking of fuels. (258,261.)

3887 (1927). *Silica en Ovenbouw Mij.* Recovery of benzenes from coal gas. (265,984.)

7115 (1927). *Arnold (Standard Development Co.).* Cracking hydrocarbons. (274,763.)

*7660 (1927). *Holzverkohlungs-Ind. A.-G.* Fuel for internal-combustion engines. (274,811.)

*15,205 (1927). *I. G. Farbenind.* Bleaching of mineral oils and fats. (274,828.)

*18,996 (1927). *I. G. Farbenind.* Dehydration of moist fuel. (274,858.)

*19,270 (1927). *Koks- u. Halbkoks-Brikettierungs-Ges.* Manufacturing briquettes from fuels, ores, etc. (274,876.)

*19,294 (1927). *Lederer.* Production of carbon. (274,883.)

III.—Application

Leonard. Treatment of higher phenols. July 29.

III.—Complete Specification

3887 (1927). *Silica en Ovenbouw Mij.* See II.

IV.—Applications

British Dyestuffs Corp., Ltd., and Mendoza. Dyes etc. July 27.

Carpmael (I. G. Farbenind.). Manufacture of sulphur dyestuffs. July 28.

Holliday & Co., Ltd., and Shaw. Production of black vat dyestuffs. July 28.

I. G. Farbenind. Manufacture of triarylmethane-dyestuffs. July 27. (Ger., 9.8.26.)

I. G. Farbenind. Manufacture of stable diazo-salt preparations. July 27. (Ger., 2.8.26.)

I. G. Farbenind. Manufacture of azo-dyestuffs. July 28. (Ger., 5.8.26.)

I. G. Farbenind. Production of coloured compounds. July 29.

I. G. Farbenind. Manufacture of azo-dyestuffs. July 29. (Ger., 29.7.26.)

IV.—Complete Specifications

4599 (1926). *Carpmael (I. G. Farbenind.).* Manufacture of vat dyestuffs of the 2-thionaphthene-2-indolindigo series. (274,527.)

10,265 (1926). *I. G. Farbenind.* Manufacture of cyclic hydrocarbons and derivatives thereof. (251,270.)

10,560 (1926). *Carpmael (I. G. Farbenind.).* Manufacture of derivatives of the anthraquinone series. (274,558.)

10,570 (1926). *Carpmael (I. G. Farbenind.).* Reduction of aromatic nitro compounds. (274,562.)

16,223 (1926). *Johnson (I. G. Farbenind.).* Manufacture of colour lakes. (274,627.)

17,039 (1926). *I. G. Farbenind.* Manufacture of azo-dyestuffs. (255,072.)

29,899 (1926). *Holliday & Co., Ltd., and Shaw.* Manufacture of chloranil and bromanil. (274,700.)

127 (1927). *I. G. Farbenind.* Manufacture of dyestuffs of the triarylmethane series. (263,879.)

8285 (1927). *I. G. Farbenind.* Manufacture of alkylated or cyclo-alkylated aryl-sulphonic acids. (268,375.)

10,319 (1927). *I. G. Farbenind.* Manufacture of compounds of aromatic paradiamines with sulphur dioxide. (269,583.)

*19,492 (1927). *I. G. Farbenind.* Manufacture of carboxylic acids of acenaphthene. (274,894.)

*19,602 (1927). *I. G. Farbenind.* Manufacture of derivatives of acenaphthene. (274,902.)

V.—Applications

British Celanese, Ltd., and Bower. Apparatus for manufacture of artificial threads. July 26.

Carpmael (I. G. Farbenind.). Treatment of cellulose. July 28.

Ellis. (Soc. Fabr. Soie Rhodiaseta). Treatment of filaments, threads, etc. July 26.

Holkenseide Ges. Treatment of artificial silk. July 29. (Ger., 26.10.26.)

Waelc. 20,274. See XIII.

V.—Complete Specifications

802 (1926). *Lilienfeld.* Manufacture of artificial materials from viscose. (274,521.)

11,247 (1926). *Parker, Kershaw, Barrett, and Bleachers Assoc., Ltd.* Treatment of yarns or fabrics of artificial silk. (274,584.)

28,291 (1926). *Lilienfeld.* Manufacture of artificial threads from viscose. (274,690.)

32,332 (1926). *Krupp Grusonwerk.* Cleaning plant fibres. (274,716.)

*9500 (1927). *Soc. Chim. Usines du Rhône.* Continuous manufacture of cellulose acetate. (274,814.)

*17,525 (1927). *British Celanese, Ltd.* Application of cellulose esters and ethers. (274,841.)

*19,424 (1927). *I. G. Farbenind.* Opening-up materials containing cellulose. (274,892.)

VI.—Applications

British Celanese, Ltd., Ellis, Miller, and Olpin. Dyeing etc. materials containing cellulose acetate. July 30.

Carpmael (I. G. Farbenind.). Vat dyeing of leuco ester compounds of indigo dyestuffs etc. July 26.

I. G. Farbenind. 19,986. See IV.

I. G. Farbenind. Production of yellow dyeings on cellulose esters. July 25. (Ger., 29.7.26.)

VI.—Complete Specifications

10,241 (1926). *Leitch & Co., Ltd., Everest, and Wallwork.* Vat dyeing. (274,550.)

14,072 (1926). *British Dyestuffs Corp., and Chapman.* Wetting-out agents or emulsifiers. (274,611.)

18,138 (1926). *Durand & Huguenin A.-G.* Dyeing animal fibres. (255,501.)

19,100 (1926). *Mitchell.* Dyeing or like machines. (274,651.)

31,844 (1926). *Karrer.* Treatment of cotton and viscose silk fibres, preparatory to dyeing. (263,169.)

18,995 (1927). *Johnson (I. G. Farbenind.).* Desizing. (274,795.)

*13,966. (1927). *I. G. Farbenind.* Dyeing acetate silk. (274,823.)

*19,027 (1927). *Lilienfeld.* Treating cotton fibre. (274,860.)

*19,305 (1927). *Kohorn & Co., and Perl.* Apparatus for wet-treatment of textiles. (274,885.)

VII.—Applications

Carpmael (I. G. Farbenind.). Manufacture of chlorides etc. of silicon and titanium. July 26.

Fagelston and Smith. Oxidation of ammonia. July 30.

Johnson (I. G. Farbenind.). Manufacture of phosphates. July 27.

Johnson. Manufacture of cobalt carbonyl. July 28.

Meyerhofer. Decomposing salts of complex hydrofluoric acids. July 28.

Sacchi. Production of hydrogen etc. July 25.

Zaidan Hojin Kikagaku Kenkyujo. Preparing pure alumina. July 29. (Japan, 3.2.27.)

VII.—Complete Specifications

14,800 (1926). *Blumenfeld.* Manufacture of titanium oxide. (253,550.)

16,448 (1926). *Ring Ges.* Producing active silicic acid. (254,726.)

7661 (1927). *Daloze.* Manufacture of pure lead carbonate from crude lead sulphate. (273,660.)

VIII.—Application

Goldschmidt, Thiel, and Vacha. Manufacture of unbreakable glass. July 25. (Ger., 12.10.26.)

IX.—Applications

Leuchte and Tauber. 10,989. *See* XIII.

Spencer and Walkden. Brick etc. kilns. July 25.

IX.—Complete Specifications

15,235 (1926). Scheidemandel and Scheidemandel. Production of heat-insulating material. (253,919.)

12,949 (1927). Harnisch. Manufacture of artificial stone. (271,108.)

X.—Applications

Debuch. Treatment of ores. July 27.

Garnett, Holden, and Smith. Iron alloys. July 27.

General Electric Co., and Weintraub. Metallic coatings. July 26. (Fr., 27.7.26.)

General Electric Co., and Goldsmith. Manufacture of metal powders. July 28.

King, Morris, Schiff, and Wilder. Treatment of complex minerals. July 30.

Koehler. Production of magnesium. July 29.

Krupp A.-G. Blast furnaces. July 25. (Ger., 6.8.26.)

Krupp A.-G. Steel alloys. July 25. (Ger., 23.8.26.)

Lundberg. Electrolytical precipitation of metals. July 25. (Swed., 24.6.26.)

Mauler. Ascertaining resistance to rusting of iron etc. July 28.

Metallbank und Metallurgische Ges. Converting tin ores. July 29. (Ger., 9.8.26.)

Pocock. Manufacture of white alloys. July 25.

Smith. Separation of cobalt. July 25.

Southern, and Wincott, Ltd. Manufacture of metals and alloys. July 29.

X.—Complete Specifications

22,663 (1926). Gothe. Electroplating. (274,671.)

28,447 (1926). Ezeberg. Concentrating ores etc. by flotation. (261,395.)

28,815 (1926). Blackford. Fluxes for soldering. (274,693.)

*29,345 (1926). Wittek. Reducing ores. (274,803.)

*19,121 (1927). Schrobdsdorff. Alloys. (274,866.)

*19,270. (1927). Koks- u. Halbkoks-Brikettierungs-Ges. *See* II.

*19,293 (1927). Appel. Electrolytic separation of chromium. (274,882.)

*19,762 (1927). Sundberg. Electrolytic precipitation of metals. (274,913.)

XI.—Applications

Almeida Accumulators, Ltd., and Levy. Galvanic batteries. July 27.

Dufour. Electric furnaces. July 28. (Belg., 4.8.26.)

Furness. Electric cells. July 25. (U.S., 23.7.26.)

Hilbrenner. Electric insulating substances. July 26.

Kohne and Suhreke. Electric cells. July 28.

Lahousse. Composition for electric insulation etc. July 25. (Fr., 12.8.26.)

Lundberg. 19,762. *See* X.

Oswald. Carbons for electrotechnical uses. July 27.

Siemens & Halske A.-G. High-frequency induction furnaces. July 28. (Ger., 29.7.26.)

XI.—Complete Specifications

22,663 (1926). Gothe. *See* X.

*19,293 (1927). Appel. *See* X.

*19,377 (1927). Siemens & Halske A.-G. High-frequency induction furnace. (274,888.)

*19,762 (1927). Sundberg. *See* X.

XII.—Complete Specifications

2895 (1927). Petroff. Decomposing the emulsions in the splitting of fats and oils. (274,741.)

*15,205 (1927). I. G. Farbenind. *See* II.

XIII.—Applications

Bakelite Corp. Artificial resin compositions. July 26. (U.S., 3.8.26.)

British Thomson-Houston Co., Ltd. Coating-materials. July 25. (U.S., 16.8.26.)

Eberhard. Coating-materials. July 26.

Leuchte and Tauber. Coating and binding compositions. July 27. (Ger., 3.8.26.)

Rostschutz-Farb. Liebreich. Rust-preventing oil paints. July 26. (Ger., 27.7.26.)

Waele. Cellulose paints, varnishes, etc. July 30.

Zuccarino. Composition for indelible reproduction etc. July 25.

Zuccarino. Producing indelible documents. July 26.

XIII.—Complete Specifications

10,914 (1926). Drummond. Synthetic resins of the phenol-aldehyde type. (274,581.)

13,024 (1926). Soc. Chem. Ind. in Basle. Condensation products from urea or a derivative thereof and formaldehyde. (253,094.)

16,223 (1926). Johnson (I. G. Farbenind.). *See* IV.

143 (1927). Craven, Bedford, and Yorkshire Dyeware and Chemical Co., Ltd. Cement for linoleum etc. (274,722.)

XIV.—Applications

Cook. Extracting oils from waste rubber. July 26.

Dunlop Rubber Co., Ltd., Chapman, and McKay. 19,461. *See* I.

Dunlop Rubber Co., Ltd., and Twiss. Manufacture of articles from aqueous dispersions containing rubber etc. July 25.

Du Pont de Nemours & Co. Rubber compositions. July 26. (U.S., 31.8.26.)

XIV.—Complete Specifications

27,156 (1926). Soc. Ital. Pirelli. Regenerating vulcanised rubber. (260,620.)

3039 (1927). Butler. Liquidised crude rubber. (274,742.)

*23,712 (1926). Hercules Powder Co. Reclaiming rubber and fabric from scrap. (274,797.)

XV.—Application

Hirsch. Manufacture of threads, cords, etc. from gelatin. July 25.

XVI.—Application

Gordou, and Imperial Chem. Industries, Ltd. Fertilisers. July 29.

XVII.—Complete Specifications

*27,450 (1926). Raffinerie Tirlémontoise. Curing masse-cuite etc. (274,799.)

*27,451 (1926). Raffinerie Tirlémontoise. Removal of false grain from sugar syrups or molasses. (274,800.)

XVIII.—Application

Kelly. Treating fermented materials. July 29.

XVIII.—Complete Specification

31,468 (1926). Jordt (Freise). Production of sparkling wines. (274,707.)

XIX.—Applications

Diethelm and Stiner. Preparation of foodstuffs, etc. July 26. (Switz., 26.7.26.)

Gyllenhammer. Producing corn products. July 26.

Krause. Sterilisation. July 25. (Ger., 26.7.26.)

North. Manufacture of beverages. July 27.

XIX.—Complete Specifications

*19,723 (1927). Krause. Sterilisation. (274,909.)

*19,837 (1927). Stiner and Diethelm. Preparation of foodstuffs and fodder. (274,915.)

XX.—Applications

Calcott, Loriman, and Parmelee. Production of tetra-ethyl lead. July 26. (U.S., 3.11.26.)

Comp. de Bethune. Catalysts for synthesis of alcohols. July 25.

Dreyfus Manufacture of aliphatic compounds. July 30.

Imray (Monsanto Chem. Works). Production of benzoic acid from phthalic anhydride. July 29.

Marks (Internat. Nahrungs u. Genussmittel A.-G.). Producing mercaptans of the furfuryl series. July 25.

XX.—Complete Specifications

10,265 (1926). I. G. Farbenind. See IV.

13,024 (1926). Soc. Chem. Ind. in Basle. See XIII.

23,798 (1926). Austerweil. Manufacturing borneol and isoborneol. (258,901.)

20,899 (1926). Holliday & Co., Ltd., and Shaw. See IV.

82,85 (1927). I. G. Farbenind. See IV.

XXI.—Applications

Kodak, Ltd. (Eastman Kodak Co.). Photographic sensitizers. July 28.

Martinez. Colour photography. July 26.

XXI.—Complete Specifications

11,853 (1926). Thornton. Kinematograph and other colour films. (274,591.)

*30,061 (1926). Chromo Filmes. Colour kinematography. 274,804.)

*17,198 (1927). Berthon. Films for colour kinematography. (274,837.)

XXII.—Application

Guthke. Manufacture of explosives. July 25. (Ger., 28,726.)

XXIII.—Application

Krause. 19,723. See XIX.

XXIII.—Complete Specification

*19,723 (1927). Krause. See XIX.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Argentina*: Paint, varnish (105); brass sheets, tar oil, palm oil, sodium silicate (107); electric generating plant and pumping machinery (A.X.4996). *Belgium and Belgian Congo*: Pharmaceutical products (91). *British India*: Industrial rubber goods, cement (87); steel rails, copper plates, mild steel sheets, potassic iodide (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Canada*: Sheep dip (89). *Cuba*: Earthenware (108). *Czechoslovakia*: Brass tubes, aluminium and raw copper (92). *South Africa*: Disinfectant fluid (B.X.3678); creosote (B.X.3677). *Turkey*: Carbide (103).

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during July, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 641, of which 480 were from merchants or importers. To these should be added 26 cases outstanding on June 30, making a total for the month of 667. These were dealt with as follows:—Granted—578 (of which 532 were dealt with within 7 days of receipt); referred to British makers of similar products—70 (of which 51 were dealt with within 7 days of receipt); referred to reparation supplies available—3 (all dealt

with within 2 days of receipt); outstanding on July 30, 1927—16.

Of the total of 667 applications received, 586, or 88 per cent., were dealt with within 7 days of receipt.

Condensed Milk Regulations

The Minister of Health is about to make regulations amending the Public Health (Condensed Milk) Regulations, 1923, so far as they relate to the labelling of condensed milk. The regulations will apply to all condensed milk intended for sale for human consumption in England and Wales. Copies of the draft regulations can be purchased from H.M. Stationery Office, or through any bookseller (price 1d.). Any representations on the subject should be addressed to the Secretary to the Ministry at an early date.

Caledon Dyes on Cotton Yarn

Scottish Dyes, Ltd., have issued a pattern card entitled "Caledon colours on cotton yarn," showing the principal vat colours which they manufacture. As is well known, the Caledon colours belong to the anthraquinone vat series and are of unsurpassed fastness, so that their use is essential for the highest classes of fast coloured goods. Notes on the method of dyeing are given, and the patterns show the colours in self and mixed shades on a mercerised bleached cotton yarn.

News from Advertisements

There is a vacant Lectureship in fuel technology at the Imperial College of Science and Technology (p. vi).

A Coal Research Fellowship at the Imperial College of Science and Technology is offered in connexion with Sensible Heat Distillation, Ltd. (p. vi).

Students will be interested in the facilities offered at the Imperial College of Science and Technology for study and research in fuel technology, chemical engineering and electro-chemistry (p. vi).

A lady with scientific training, and good knowledge of French and German, is required for extracting technical literature and to take charge of a library (p. vi).

Surplus chemical manufacturing plant is for sale (p. vi).

EDITORIAL

Crystalline Insulin

THE discovery of insulin, its production in adequate quantities at a rapidly diminishing cost, and the almost miraculous results in the treatment of diabetes which have been made with its aid, are matters which have been so graphically told by the President of the Society in a series of addresses that there can be few chemists or chemical engineers, however engrossed in their own specialised activities, who will remain quite unimpressed as the story of further progress is unfolded. Although the manufacture of insulin has progressed so that preparations with greater and greater potency have been made, a single active principle has not yet been isolated. The preparation of crystalline insulin by a group of American investigators whose results are reported in the *Journal of Pharmacology and Experimental Therapeutics*, published in Baltimore, presents an interesting landmark in this field. Not only has the wealth of scientific knowledge been increased by this work, but it may be that it marks an important stage in the identification of the active principle of insulin, a stage which must precede any attempts at the preparation of synthetic insulin. It may be long before this is achieved, but, with the recollection of the isolation of thyroxine from the thyroid gland, its identification, characterisation, and final synthesis, we may escape the charge of undue optimism if we venture to hope that synthetic insulin will eventually appear amongst the successes of British fine chemical manufacture.

It has been known for some time that insulin separates from solution most satisfactorily at its isoelectric point, and it now appears that when pyridine is added to an acid solution of commercial insulin containing brucine acetate, marked precipitation occurs at a hydrogen-ion concentration less than 5.5, but the precipitate consists mainly of impurities associated with a little active material. At the isoelectric point, however, that is, between pH 5.55 and 5.65, the further addition of pyridine or ammonia causes the separation of insulin in a crystalline condition. From commercial insulin showing, we presume, a content of around eight or ten International Standard Units per milligram, some 25% of crystalline insulin with an activity of over 40 units per milligram; can fairly readily be prepared, and the relative availability of crystalline insulin may be expected to stimulate investigations into more fundamental matters. Already a formula for insulin has been advanced, namely, $C_{45}H_{69}O_{14}N_{11}S_3H_2O$, or a multiple of this. As in the case of commercial insulin, crystalline insulin shows the biuret, Pauly, Millon and other characteristic reactions, whilst it contains no tryptophan.

The exact mechanism of the action of brucine acetate is not clear, but it appears probable that a complex between the acetate of the alkaloid and insulin is formed just as in the case of phosphotungstic acid with vitamins or digitonin with sterols, and this remains in solution until the isoelectric point of insulin is reached, whereupon insulin separates on account of its low solubility at this point. Much remains to be done before it can be surely asserted that a single active principle has been obtained, for it is not without the bounds of possibility that the crystalline material obtained is nothing more than some other substance containing an extremely small amount of an amazingly potent principle associated with it, and that the formula noted above may be very wide of the mark. It will be remembered that claims for the isolation of pure vitamins have not seldom been made, only to be falsified by later investigations. The most recent work on crystalline insulin cannot be disregarded, however, if only from the point of view of the commercial production of a more concentrated and more stable preparation.

"Chemical Reviews"

If there is one thing that grows faster than another, it is the literature of chemistry; the other, of course, is the opportunity of reading it. Time was when professors acquainted themselves, as a matter of routine, with the manifold details of almost all contemporary chemical research, and secured at first hand a working knowledge of developments in many of the other branches of science. To-day the systematic perusal, from cover to cover, of an abstract journal is a habit to be proud of. Time also was when it was possible for the average man to appreciate all that was said at an average meeting of a chemical society; now he accounts himself fortunate if he is able to grasp with lightning rapidity the general significance of work remote from his own, to which end, moreover, it is usually necessary to learn the other fellow's jargon. Chemical science, in fact, is becoming so highly disperse a phase that soon the school investigating the nucleus will cease to associate with the school studying the electron shells, except at conversaciones. Thus does the wood tend to become obscured by the trees. The chemical tourist nowadays finds it increasingly necessary, therefore, to fall back on regular reports of the "state of the roads" (if one may so refer to the Annual Reports) and to handy pocket guides (if such a description may be applied to "Chemical Reviews," of which Volume IV, No. 1, is the most recently issued part).

Obviously reviews, if they are to be reviews and not mere compilations, must be written by men who know, and know that they know. Too often those who know

don't talk, and those who talk don't know. Hence it is as well to remember that most of the articles in "Chemical Reviews," which is published quarterly under the auspices of the American Chemical Society, are received by invitation. Moreover, a survey which is really authoritative and survives the attention of an obviously competent editorial board leaves little loophole for the perpetuation of errors of comprehension or transcription, a matter of importance when the work is likely to be used as a source of inspiration in preparing lectures and in writing text books. The perpetuated error is a public nuisance. Was it not Pe-hung who remarked that it is easy to kill a dragon, but quite impossible to keep him dead? Let us therefore learn from the Masters; let us read Richards on atomic weights, Donnan on membrane equilibria, Urban on the yttrium earths, von Weimarn on precipitation, Davey on atomic and ionic radii, Irvine on polysaccharides, Mouren and Dufraisse on catalysis and auto-oxidation, Munsfield Clark on reversible oxidation-reduction in organic systems, Hevesey on the discovery of new elements with X-rays, and as many as in us lies of the thirty-five other articles which are already available.

The Art and Science of Perfumery

Whether we like it or no, perfumes and perfumed preparations are being increasingly used by both men and women to-day. Perfumes and aromatic substances have appealed to man to a smaller or greater extent throughout the ages, and it is probable that the sense of smell was more highly developed for utilitarian purposes in the creatures of an uncivilised world than it is to-day, or even, for that matter, in the days of the earliest civilisations. The blending of Nature's gifts of odoriferous materials into a true perfume which should appeal to the aesthetic appetite of man has ever been an art, and, although science has recently shown how best to extract natural odoriferous principles in perfection and to prepare artificial perfumes, resembling those of nature or even striking entirely new notes, the final preparation of the blended perfumes still remains an art. The study of the chemistry, physiology, and psychology of odour perception will open out the science of perfumery, and the researches of the organic chemist will further extend the range of odoriferous materials, but the blending of the raw products into sweet, invigorating, languorous, or wild perfumes will remain a task for the artist perfumer.

But science must also play an important part in the cultivation of a general artistic sense of odour, and the chemist, by providing materials and developing theories upon the basis of which odour perception may be more clearly defined, the physiologist and psychologist, by tracing the specific appeals of various odoriferous substances and co-relating odour perception and association, physiological effect or mental reaction, will furnish the artist's studio more usefully and elaborately than has ever before been possible.

Perfumes, spices, and aromatic gums were in use in the most ancient civilisations, and there is evidence of their employment five thousand years ago. In Babylon, Egypt and Palestine scented ointments and embalming materials were used, whilst gums were employed in the temples. In India, Persia, and Arabia the preparation

of perfumes was a highly developed art in the early years* of the Christian era, and there is indirect evidence that distillation processes were known in India earlier than three thousand years before Christ, for otherwise the potency of the beverage "Soma" can scarcely be understood. It is probable, then, that the art of distillation was also brought to bear upon the preparation of perfumes from flowers, spices, and aromatic substances. A considerable trade in spices and aromatics was carried on in the days of the early civilisations, and precious scents, spices, and oils were royal gifts. There are many references to the matter in sacred writings, both in the Old and New Testaments. Thus, we find that the caravan which carried off Joseph into Egypt was laden with spices, which in the olden days were reserved by the priests for religious ceremonial.

About three hundred years before Christ, Appollonius wrote a treatise on perfumes, and, *inter alia*, essences of roses and iris were described, and the places of origin of the flowers were noted. In tracing the use of perfumes amongst the greater civilisations, it is noteworthy that excessive use has almost invariably been associated with a decadent nation. The extravagances of the Athenians in the perfume shops and in their homes, where trained doves with perfumed wings fluttered in an atmosphere already semi-saturated with expensive perfumes, the excesses of Nero, Louis XV and Madame Pompadour, may serve as reminders of this fatal association. It must not be inferred, however, that perfumes tend to moral degeneration in general, for the Athenian, the Roman, and the French societies would have fallen to the dust had not a single drop of perfume volatilised into their rotten atmospheres.

After the fall of the Roman Empire the use of perfumes in Europe disappeared until it was revived by the Moorish invaders, amongst whom the appreciation and use of perfumes had never waned. The fashion spread to France and Italy, whence in the reign of Elizabeth the Count of Oxford introduced it into this country. Although perfumes were more and more applied in England, the excesses and extravagances of the French court were never copied, but it is interesting to note that an Act of 1770 provided that any woman who should "deceive, entice or influence to marry any of His Majesty's subjects by the aid of perfumes . . . shall be subject to the same penalty as that now in force against sorcery, and that marriage shall be declared void and of no effect."

The use of perfumes and perfumed preparations is now widespread throughout the civilised world, and by modern methods of production from natural and synthetic bases, exquisite perfumes can be obtained at low prices, even in spite of the high duty which legislators place upon the alcohol used as solvent and vehicle for the base.

Although, then, the artist, the physiologist and the psychologist have an intimate connexion with the use of perfumes, the chemist has no mean task. He controls the extraction and purification of natural perfumes, and makes artificial odoriferous materials in large amounts. The synthetic perfume industry was born in this country, and when we return to the subject we shall hope to show that this section of the British chemical industry is by no means insignificant.

WEIGHING IN THE CHEMICAL INDUSTRIES*

By W. A. BENTON†

I do not propose to deal in any detail with the chemical balance in this address, as that instrument alone would require a much longer time than is available for treating the entire subject.

Let it suffice to say that the recent introduction of very light and rigid alloys for the construction of the beam, and the much greater attention now given to the smooth working of relieving devices by all makers of repute have resulted in rendering the modern chemical balance an extremely accurate and sensitive appliance.

The short beam-length now used in order to reduce the period of vibration and enable rapid weighments to be achieved has been accompanied by a loss of intrinsic sensitivity, which many makers—especially on the Continent—have endeavoured to compensate for by using extremely keen knives, and making all the balanced parts excessively light.

For ordinary laboratory use such balances are not to be recommended. It is very much better to sacrifice a little sensitivity than to obtain that quality at the cost of reliability and general accuracy.

May I suggest that when purchasing a balance for ordinary laboratory use attention should first be given to the mounting and relieving devices, the contour of the relieving cam, and the length and correct alignment of the knife-edges. If these features are satisfactory, next have regard to the equality of arm length by exchanging weights and loads from one pan to the other. Gauss's method may be used to find the divergence of the indicated weight of the load in the load-pan from the true weight. Extract the square root of the product of the apparent weights of a load weighed successively in each pan. This gives the true weight irrespective of any difference in the lengths of the arms of the beam.

It is rather astonishing to find how many of the cheaper sort of beautifully-finished chemical balances break down badly under this test. The head of a large laboratory told me a little time ago that fifteen short beam German instruments in his laboratories had proved on his examination to be very defective, in spite of the fact that the junior chemists who were using them were very pleased with their great sensitivity and rapidity of operation. The majority of these balances turned at a fraction of a milligramme—a near approach to the original guaranteed sensitivity of one-tenth of a milligramme on a maximum load of two hundred grammes.

Just think of that ratio for a moment. It is one in two-millions. Now an indicator fraction of one two-millionth is a very high degree of sensitivity in any type of weighing device. But an accuracy fraction of one two-millionth is only obtainable if extremely great care is taken. As a matter of fact, I am unable myself to accept anything like that figure in the case of any weighment made carefully under usual conditions on an ordinary high-class chemical balance. An accuracy fraction of one five-hundredth-thousandth is a very good figure, and anything better than this can only be

certified after very careful double weighing of the weights used, and after taking special precautions in respect of constancy of temperature, humidity of atmosphere, freedom from convection currents and other disturbing conditions—not to mention, in the case of light or bulky bodies, correction for barometric pressure.

Our own practice in the testing of ordinary standard weights is always to use the Borda or counterpoise method of weighing which eliminates arm-length errors. It may be mentioned here that by means of the theory of probabilities, it has been calculated on the basis of reasonable suppositions that the error on two weighments checked by the Borda method will probably be twice as great as the error on two weighments checked by the method of Gauss; but such errors are extremely minute.

Figure 1 shows diagrammatically the Borda or counterpoise method. Such an illustration may have already suggested to some chemists present that the best way

FIG. 1

Borda weighing

The load is counterbalanced by shot or other suitable material until perfect equilibrium is obtained. The load is then removed, and the counterpoise balanced by standard weights replacing the load. Such weights must be exactly equal to the load.

to get rid of arm inequality would be to have only one weight-pan—a so-called one-armed balance. Dr. Branner, in his book on the "Construction of the Balance," thinks that Bockholtz was the first inventor, and L. Reiman the re-discoverer of this type of balance. The illustration (Fig. 2) shows in diagrammatic form the chief features of such an instrument. No relieving gear is shown, but would, of course, be necessary.

The period of oscillation may be reduced to about half that of an equal-armed balance, and I do not think that the difficulties presented by changes due to temperature are insuperable, as it should be possible mathematically to calculate the shape and location of the counterpoising mass so as to give the best conditions. Such a balance always carries the same load, for the rigid counterpoise is sufficiently great to balance a load equal to the total capacity of the instrument, and when the load-pan is empty weights are always on the lower pan—that is, the weight-pan—equal to this amount.

* Read before the Chemical Engineering Group and the Midland Section of the Society of Chemical Industry, at Birmingham, April 20, 1926.

† Head of Research Department, Messrs. W. & T. Avery, Ltd., Soho Foundry, Birmingham

The substance to be weighed is placed on the top pan and weights are then removed from the weight-pan until a balance is obtained. The weights removed are equal to the weight of the substance.

An objection made to this type of balance is that the knife-edges are always subjected to the maximum load the beam is designed to carry. As against this there is the great practical advantage that the beam is always flexed to an equal extent, whereas with all equal-armed beams employed in the usual manner the stability of the system increases with the load, owing to the inevitable bending of the beam.

Whether this admirably simple and reliable type of balance will ever become popular with chemists remains to be seen. I am of opinion that it presents great practical advantages, and this opinion is shared by several mathematicians, physicists and balance-makers of my acquaintance, both in England and abroad. It is probably only the extreme conservatism of chemists in regard to their all-important instrument,

FIG. 2

Diagram of one-arm chemical and physical balance working under constant total stress. A balance eliminating arm-length error

the chemical balance, which prevents the adoption of a design along the lines here suggested.

For determinations of specific gravity an instrument of the above type is specially adapted.

Very large capacity balances are used for weighing bullion and other costly substances (Fig. 3), and these are precisely similar in almost every respect to chemical balances, but their construction, in view of the great stresses involved, presents special problems, the solution of which has only been found as a result of innumerable experiments.

We noticed a moment ago that the so-called "one-armed" balance was specially adapted for determinations of specific gravity, and I may here call attention to the demand which is now arising for very large sensitive physical balances to enable the exact specific gravity or relative density of heavy ingots to be quickly ascertained. For many technical purposes it is extremely important to know whether an ingot is absolutely sound, free from blow-holes and the like. The physical balance presents a ready way of ascertaining the facts, but the experiment requires to be performed with some

care. The temperature and density of the water should be known accurately, and these data related to the density of a specimen weighed under standard conditions and known to be sound.

While a sensitive balance is necessary for this determination, it is, perhaps, proper to point out that generally

FIG. 3
"Avery" bullion balance

the errors due to faults of experimentation are much greater than those due to the balance. Not only is it necessary to take note of the temperature and density of the water; it is even more important to see that every part of the specimen is perfectly wetted, and that there are no minute bubbles clinging to its surface.

FIG. 4
The original Roberval balance

The use of a camel-hair brush is advisable, or, better still, the specimen may be wetted under a water jet escaping at a reasonably high pressure. If such precautions are taken, I know no better way of testing the soundness of an ingot or other piece of material than by finding its relative density.

I will now briefly indicate the chief features of some of the weighing instruments used in industry, which are likely to be especially interesting to chemical engineers. Leaving single-beam instruments we will turn to linked mechanisms.

Fig. 4 represents a model of the famous static enigma invented by Roberval in 1670. It is the basis of the well-known counter scale in which the weight-pans are located above the beam, and vertical legs are extended

Fig. 5

Diagrammatic view of Roberval pattern counter scale

from the pans either upwards above them, or downwards below them, and connected by means of pivoted stays to anchor centres on the framework so disposed as to form linkage parallelograms. Over a hundred years elapsed before a satisfactory explanation was given of the static enigma, and probably a rather longer time before the first weighing instruments embodying the principle were available for use.

If the legs are made long the Roberval parallelogram gives a well-designed, robust and very reliable instru-

the lecture table is an example of the "French" stay mechanism used to obtain frictionless contact on one line in tension or compression—a very beautiful form of kinematic pivot.

Beranger's mechanism is the type usually favoured by chemists for "large sample" weightings. In this

Fig. 6

Diagrammatic view of the inverted or "Imperial" type of Roberval balance

design we have a rather elaborate compound lever device, which will not weigh reliably or accurately unless made by highly-trained mechanics. Given good design and workmanship, however, no type of pan-above-beam

Fig. 7

Diagrammatic outline of Beranger balance. New pattern

ment. It has the great advantage over other types of weighing with a high degree of accuracy even if the beam is inclined considerably to the horizontal. The illustrations (Figs. 5 and 6) show various forms, and on

mechanism is more suitable for general use for the purposes indicated above. It is very sensitive and very dependable. The mechanism is shown in the line illustration (Fig. 7). It will be noted that the subsidiary

levers hang from the main beam at intermediate knife-edges, and that their outside knife-edge pivots are anchored by vertical links to the base-plate. The leverage of the main beam and the two subsidiary levers must be precisely the same.

Passing now to machines of higher capacity we come to compound lever mechanisms such as are used in platform machines from 3 to 50 cwt. and in weighbridges up to 100 tons or more. All these mechanisms are based on the combination of levers first invented by the famous Birmingham mechanic, John Wyatt. His first bridge was erected about the year 1745. In its main principles it is similar to the bridges we make to-day.

Other illustrations will make clear the construction of modern compound lever machines and their connexion to the wonderfully accurate steelyards that modern dividing engines enable us to construct. In Fig. 8 the transfer lever connecting the great load-bearing levers to the steelyard can be clearly seen. It may interest chemists to know that a weighbridge, properly constructed and adjusted, is a marvellously sensitive and accurate instrument. I have recently tested a 50-ton bridge fitted with a new type of dial. Under a load of 30 tons the pointer moved forwards or backwards when a load of 1 lb. was added to or removed from the platform. Fitted with a steelyard, a load of 100 tons has responded to the addition or removal of 1 lb.—an *indicator fraction* of one two-hundred and twenty-four thousandth. It may thus be fairly claimed that a well-made weighbridge possesses sensitivity and accuracy of the same order as an ordinary chemical balance.

Before leaving these mechanisms I would remind you of the *printing devices* now fitted to steelyards, and of the

FIG. 8

A large modern weighbridge under test

ingenious means provided for making it impossible to print a ticket unless the weigh-beam is completely balanced.

The question is sometimes asked whether at the present

time a loose-weight steelyard is not always better than one devised to balance the entire load by the movement of a poise. I should answer "Yes," providing that equal care be taken to make the best type of each

FIG. 9

The earliest known form of self-indicating weighing instruments

These models have been constructed by the Research Department of Messrs W. & T. Avery, Ltd., from sketches made by their inventor, Leonardo da Vinci, the great Italian artist, mathematician, and scientist (born 1452, died 1519). The sketches are to be found in the notebooks of Leonardo now preserved in Paris. From his description it is clear he was very much alive to the advantages of viable automatic weighing, for he enlarges on its exactness and rapidity. The models are rather smaller than "half-an-arm's length" in diameter of dial—the dimension which Leonardo had in mind. He says that to prevent injury by damp they should be made of a gold-like material ("Debbe essere di richelcho"). Possibly he means good brass. — SOHO FOUNDRY, BIRMINGHAM, Feb., 1926.

instrument. Undoubtedly the most accurate method of weighing a load is to balance it as far as can conveniently be done by the deposition of weights on one and the same knife-edge. On the other hand, extreme accuracy is not always necessary even in the chemical industry, and wonderfully accurate weightings are now possible with steelyards of the "no-loose-weight" type, while the advantages in point of rapidity and convenience of weighing are all in favour of the latter form.

We must now attempt a brief mention of some of the various types of self-indicating scales which during recent years have become of such immense importance in industry and commerce. It must not for a moment be supposed that the use of these automatic devices is confined to retail shops—the number and variety of types sold for industrial purposes is enormous, and their use grows from year to year.

I have had two models built up from sketches and descriptions preserved in the notebooks of Leonardo da Vinci, their inventor (Fig. 9). These are the first authentic records of the invention of self-indicating weighing machines, unless we include the automatic or semi-automatic balance invented by Al Khazini in the eleventh century for determining specific gravities.

(To be continued)

SPECTRUM ANALYSIS IN METALLURGY; SOME FURTHER NOTES

By J. R. GREEN

As a confirmed user for several years of spectra methods of analysis I was very glad to see the paper by Mr. Twyman (CHEM. & IND., April 1 and 8, 1927). It was high time that such a clear and authoritative statement on the whole subject of "spectrum analysis"

of purity would be more easily done by spectral means than by chemical. In many cases the requirement is that some impurity shall not exceed a specified percentage, and in such cases spectroscopic or spectrographic control is particularly suitable.

The accuracy which can be obtained with only a moderate amount of experience (and without any special apparatus for measuring the density of the lines) is remarkable. The Bureau of Standards Paper

FIG. 1

Spectra of lead-tin alloys. Note little difference in spectra for widely differing major composition

FIG. 2

Spectra of lead-tin alloys. Note great difference in spectra for less difference in composition than in Fig. 1

as it stands to-day should be available in this country, although by a coincidence there appears in the Chemical Society's "Annual Reports" this year a good survey on similar lines—the first in 23 years.

Most readers must be familiar with the broad outlines of qualitative spectrum analysis, although it is to be feared that very few will have got even as far as, for example, observing the "D" line as a doublet. It is the last part of Mr. Twyman's paper, dealing with quantitative work, that will be new to nearly all, and

No. 441, by Meggers, Kiess, and Stimson (quoted by Mr. Twyman), gives spectrographic results within 0.02% of the chemical, which is the average discrepancy, but this can be reduced to 0.01% in many cases if the range of comparison samples is well chosen.

For the benefit of those who may be sceptical or uncertain, I should like to emphasise four points with regard to quantitative spectrum analysis which Mr. Twyman has not, perhaps, fully brought out.

First, it is useless to try to make a complete analysis

FIG. 3

Estimation of tin in lead. Tin spectrum superposed as central band in each case

from experience I can confirm all that is claimed as to speed and accuracy.

Metallurgical control work of nearly every kind offers the widest scope for spectral methods, and it is no overstatement to assert that anyone in charge of such work who neglects to investigate the use of spectrum analysis is behind the times. It is probable that the control of many inorganic products, besides metals and alloys, which have to be turned out to a certain standard

by spectral methods. Fig. 1 indicates this clearly enough; the spectra of the three alloys of widely differing composition are nearly identical.

Secondly, it is the special province of quantitative spectrum analysis to estimate the small percentages (i.e., 1% or less). A comparison of Fig. 2 with Fig. 1 will make this plain. The differences between the spectra of the three alloys are very marked.

Thirdly (and some are very sceptical about this), the

chemical results *do* agree with the spectrographic. In Fig. 3 are shown the spectra of lead containing tin in unknown percentage (x), and, below, of lead containing 0.20%, 0.45% and 0.6% of tin respectively. The "steps" between the comparison samples being irregular and large, no great accuracy was expected, but in this case the spectrographic estimation (0.5% Sn) agreed with the chemical (0.5%) very well. One took 45 min. to carry out, the other a day.

Fourthly, the major composition of comparison samples and of the unknown must be approximately the same. Fig. 4 is an enlargement of part of a spectrogram of metals of the composition shown, with copper for comparison. The lines 2824 and 2618 of copper

Fig. 4

are respectively absent and much fainter in the 85/15 alloy than in the tin, although the percentage of copper is the same in each case. Mr. Twyman's Fig. 9 may mislead beginners on this point, which is of importance, and has been emphasised by Gerlach.

In conclusion one may express the hope that much wider use will be made in this country of these modern methods of spectrum analysis. It may be as well to point out that a small quartz spectrograph, with a prism of base about 23 mm., is by no means difficult to make, and is sufficient for many purposes, giving, as it does, a spectrum about 4 in. long. The one on which all the accompanying spectrograms were taken cost under £15, including the spherocylindrical condensing lens, and was made and adjusted by myself.

REPORT OF THE CHIEF INSPECTOR OF FACTORIES AND WORKSHOPS*

In his Annual Report for 1926, the Chief Inspector of Factories deals with safety organisation, dangerous trades, and questions of sanitation and health in industry. In the "Safety" section mention is made of various explosions due to dust and several accidents due to explosions of acetylene, and the limited number of factories in which fire drill is practised. The use of celluloid is extending, and there have been some cases in which fire-proof stores were not provided. No remark is made about the observance of the Regulations in chemical works. There are now 183 potteries with lead glaze certificates, and 171 with low solubility glaze certificates. It is stated that constant supervision is necessary to keep all exhaust draught plants in potteries up to the standard. The National Council of the

Pottery Industry has issued a circular to members on the prevention of dust by the provision of impervious flooring. Little trouble has been given by the vehicle painting regulations, owing to the increasing use of leadless varnish paints and the growth of the cellulose spraying process, though the provision of exhaust cabinets for large articles presents difficulties.

A general increase in the use of labour-saving appliances, such as overhead runways, conveyors, elevators, and so on, is noted.

The report of the Senior Medical Inspector gives the following table, showing the incidence of industrial poisoning or disease now notifiable by medical practitioners:—

Disease and Industries	1924	1925	1926
Lead poisoning	486 (32)†	326 (13)	242 (28)
1. Smelting of metals	38 (1)	22	26 (1)
2. Plumbing and soldering	6	7	7 (3)
3. Shipbreaking	131 (1)	31	8
4. Printing	6 (1)	8	8
5. Tinning	3	4	2
6. Other contact with molten lead	23 (1)	17 (1)	16 (4)
7. White and red lead	20 (1)	19 (1)	13 (1)
8. Pottery	47 (18)	47 (5)	41 (14)
9. Vitreous enamelling	9	9 (2)	8
10. Electric accumulators	101	73 (1)	52
11. Paints and colours	15	8	10
12. Indiarubber	3	2	2
13. Coachbuilding	30 (4)	23 (1)	11 (2)
14. Shipbuilding	8 (1)	13	8
15. Paints used in other industries	24 (2)	11 (1)	10 (3)
16. Other industries	22 (2)	29 (1)	11
Phosphorus poisoning	—	—	—
Arsenical poisoning	6 (1)	6	5 (3)
Mercurial poisoning	5	5	4 (1)
Carbon disulphide poisoning	—	3	1
Aniline poisoning	—	31 (1)	33 (1)
Chronic benzene poisoning	—	—	1
Toxic jaundice	3	2 (1)	2
Epitheliomatous ulceration	123 (24)	160 (55)	187 (49)
Chronic ulceration	45	51	55
Anthrax	43 (4)	45 (9)	38 (3)
1. Wool	19 (1)	25 (4)	15 (2)
2. Horsehair	4 (1)	5 (2)	8 (1)
3. Handling of hides and skins	16 (2)	16 (5)	12
4. Other industries	4	1	3

† Figures in brackets relate to deaths. Fatal cases not reported in previous years are included as both cases and death.

Conditions in the use of carbon disulphide in the manufacture of viscose are reported as satisfactory; the single case reported occurred in the manufacture of the disulphide itself. "Aniline poisoning" includes cases due to intermediates such as dinitrobenzene, di- and tri-nitrotoluol, as well as to the manufacture of aniline. Hot weather has some effect on the incidence of aniline poisoning, and some firms avoid the manufacture as far as possible during the warmer months. Under "toxic jaundice" is included jaundice produced by arsenuretted hydrogen gas, from which one case occurred in the manufacture of salts of zinc. The 55 cases of chronic ulceration were as follows:—bichromate manufacture, 2; dyeing and finishing, 33; chrome tanning, 2; french polishing, 7; manufacture of chrome dyes, 5; other industries, 6. Of the 187 cases (49 fatal) of epitheliomatous ulceration, 49 were due to pitch, 27 to tar, 2 to paraffin, and 109 (35 fatal) to mineral oil; of the total, 88 cases occurred in mule spinning.

It is remarked that there are few liquids employed in industry which will not, if used regularly over a long enough period, produce dermatitis in certain individuals, and the same is more or less true of dust. Special inquiries were made as to the occurrence of dermatitis among bakers, biscuit makers, alkali workers and indoor horticultural workers. Of the reported cases of dermatitis, 52 (12.1%) were due to alkalis, but in 1926 no

* H.M. Stationery Office, Cmd. 2903. Pp. 139. Price 2s. 6d.

case of dermatitis from alkali works was reported, many of the cases being due to the use of alkalis as cleansing agents. Of the 7 cases due to "accelerators" in vulcanising rubber, 3 were considered to be due to hexamethylenetetramine, which is said to react with phosphoric acid in the sweat to form acetaldehyde, which breaks down in the presence of oxygen to produce formic acid.

The reported cases of gassing are shown in the following table; the figures in brackets give the number of fatal cases:

	1924	1925	1926
Carbon monoxide ..	107 (10)	118 (10)	101 (6)
(a) Blast furnace ..	24 (1)	25 (6)	9
(b) Power ..	25 (4)	34 (1)	32 (2)

‡ Appears also under "Toxic jaundice," on Table 1

MINING AND METALLURGY IN CANADA

The eleven established fields in Alberta can supply the province with 480,000,000 cu. ft. of natural gas daily. The total amount of natural gas sold in Alberta yearly is about 9,119,000,000 cu. ft. In the fields being explored for oil there is a very great wastage of gas. The Turner Valley field alone is responsible for a daily loss of 38,000,000 cu. ft. The conservation of gas is one of the problems which confronts the provincial and federal governments.

The Britannia Mining and Smelting Co., Ltd., is now recovering and selling the iron pyrites associated with concentrate tailings formerly dumped into Howe Sound. They are passed through the mill and separated. The purchasers are chemical and pulp companies of British Columbia, and sulphuric acid manufacturers of California. Texas and Japanese sulphur is disappearing from the Pacific coast market.

The report of the Granby Consolidated Mining, Smelting & Power Co., operating in Northern British Columbia, at Anyox, and also Allenby, for the year ending December 31, 1926, shows a net profit of \$1,871,911 after deducting expenses and taxes; and interest equivalent to \$3.41 a share on stock, compared with \$1,107,234, or \$3.41 a share, in 1925. The Anyox plant produced 38,252,614 lb. copper at a cost of 8.5 cents per lb., excluding bond interest, depreciation and depletion; and 18,001,627 lb. copper, at an operating cost of 11.6 cents a pound, from the Allenby plant, a total of 52,254,251 lb. The silver production from both properties was 499,611 oz. The net current assets were increased during the year from \$2,369,189 in 1925 to \$3,607,724, of which \$2,818,996 were in cash and finished or partially finished metals. During the year, by development, 1,401,020 tons of high grade ore were added to reserve, whilst the ore treated amounted to 1,720,508. Diamond drilling at Bonanza gave an additional quantity of good grade ore, but this was not carried into reserve.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICE

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, will be available shortly. The reprints will be in JOURNAL format, with paper cover, and the price will be 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent at once to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

CALENDAR OF FORTHCOMING EVENTS

Aug. 20. NORTH OF ENGLAND INSTITUTE OF MINING AND MECHANICAL ENGINEERS, Newcastle-upon-Tyne. Annual Meeting at 2.30 p.m.

Aug. 31. BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. Annual Meeting (97th year) at Leeds. The following is a selection from the programme:

Sept. 1. *Morning*.—"Relations between the spectra emitted by the atoms of the first row of the periodic table in all stages of ionisation," by Prof. R. A. Millikan. "Co-ordination compounds," by Dr. N. V. Sidgwick (Presidential Address), followed by discussion: (Prof. G. T. Morgan, Prof. C. K. Ingold, Dr. S. Sugden and Dr. F. G. Mann). "Effects of some radiated and non-radiated sterols on the cellular constituents of the blood," by Col. C. I. Bond. "The direct and indirect oxidases," by Prof. H. S. Raper. Discussion on Lubrication: (Dr. T. Stanton, Sir W. B. Hardy and others). "Fading of dye-stuffs," by Dr. S. G. Parker. "The physiological role of the water-soluble vitamins of yeast," by Prof. J. C. Drummond. "Variations in respiratory mechanism amongst bacteria," by Prof. J. W. McLeod. "Moisture relations of colloidal fibres," by Dr. J. J. Hedges. "Action of pancreatic lipase I," by Dr. E. R. Dawson. "Action of pancreatic lipase II," by B. S. Platt. *Afternoon*.—Visit to Laboratories of the British Research Association for the Woollen and Worsted Industries. The papers include:—"Chemical aspect of wool research," by A. T. King. "Use of ultra-violet radiation in textile analysis," by H. R. Hirst. "Wool derivatives," by G. K. Fraser. Visit to the works of Wood Bros. Glass Co., Barnsley. "Some observations on the excretion of creatine," by Miss M. Hirst and Dr. C. G. Imrie, and "Contribution to the study of the oxidation of fatty acids in the body," by Dr. E. J. Wayne.

Sept. 2. *Morning*.—Discussion on the nature and formation of colloidal particles: (Sir Wm. Bragg, Prof. H. Freundlich, Prof. R. W. Gray, Dr. F. L. Usher, B. N. Desai and J. Ewles). Discussion on Coal, (1) Dr. C. H. Tander, followed by (2) Prof. J. W. Cobb, on "Our available coal supplies and their utilisation," (3) Prof. R. V. Wheeler, on "The chemistry of coal." "Utilisation of the internal heat of the earth," by J. L. Hodgson. "Requirements of the population in milk-fat (vitamin A) and the available supply," by Dr. W. Cramer. *Afternoon*.—Visit to the Department of Textile Industries, University of Leeds:—Exhibition of sheep, illustrative of

Dr. Dry's paper on "Mendelian breeding in the Wensleydale sheep." "The intra-cellular structure of the wool fibre," by J. B. Speakman. Visit to works of the Yorkshire Coking and Chemical Co., and of Messrs. Hickson and Partners, at Castleford. "The teaching and research work of soil chemistry," by Prof. N. M. Comber. Garden Party at Foxhill (Col. C. H. Tetley, Pro-Chancellor of Leeds University). (By invitation). "Warping" (illustrated by cinematograph films), by W. D. D. Jardine. *Evening*.—Discourse by Prof. R. A. Millikan on Cosmic Rays.

Sept. 5. *Morning*.—Discussion on the chemistry of hormones (Prof. G. Barger, Prof. H. S. Raper, Mr. F. H. Carr, Prof. J. C. Drummond, Prof. E. C. Dodds, Prof. J. Mellanby). Discussion on the production and distribution of milk; (Dr. A. G. Ruston, J. A. Venn, J. Wyllie, V. Laversage). "The polar properties of molecules," by Prof. P. Debye. "Problems of textile testing: (a) variability; (b) time effect," by F. T. Perce. "Nature of the action of sunlight on cotton," by Dr. Barr and Miss Hadfield. *Afternoon*. Visit to works of Messrs. L. B. Holliday & Co., near Huddersfield. "Luminous discharge in rare gases," by Prof. R. Whiddington. "The effect of light on chlorophyll," by Dr. H. Wager. Excursion to works of Messrs. J. Fowler & Co. "The oxygen relation of roots; some results of experiments," by Dr. W. A. Cannon. "Growth-promoting substances and the explanation of phototropism," by Dr. F. W. Went. "Effect of vitaglass on plant growth," by F. A. Sanders. "Metabolic effects of nitrogen," by Dr. W. H. Pearsall. "Influence of hydrogen-ion concentration on the swelling of plant tissues," by Dr. J. Ewing and Miss E. Roughton.

Sept. 6. *Morning*. "The coherence of X-rays and the J phenomenon," by Prof. C. G. Barkla. "Quantitative determination of the physical properties of artificial silk and their relationship to textile manufacture," by A. L. Wykes. "New developments in the study of acid catalysis," by Prof. H. M. Dawson. "Rapid colorimetric method for measurement of p_H ," by Miss W. J. Wadge and Mr. W. H. Newton. "Paper pulp from bamboo," by W. Raitt. Discussion on soil surveys: (Sir John Russell, Prof. G. W. Robinson, Prof. J. Hendrick, Prof. N. M. Comber, Dr. W. G. Ogg, Mr. C. G. T. Morison). "A new mass spectrograph and the whole number rule," by Dr. F. W. Aston. "Researches on menthones, menthols, and menthylamines," by Prof. J. Read. "Air conditioning," by Dr. E. Griffiths. Demonstrations: (a) Prof. B. A. McSwiney and Dr. Berenbloom—Apparatus for regulating p_H of solutions for smooth muscle experiments; (b) Miss W. J. Wadge—Methods for determining H-ion concentration; (c) Dr. H. W. Davies—Apparatus for oxygen and CO_2 administration. "Rancidification and oxidation of olive oil," by Dr. L. L. Lloyd. Discussion on plot technique: (Dr. R. A. Fisher, T. Eden, Dr. J. Tocher, A. Millar). "Note on a molecular theory of liquid viscosity," by Prof. E. N. da C. Andrade. "Co-ordination compounds of molybdenum," by Dr. W. Wardlaw. "Manufacture of viscose by parallel bobbin and centrifugal systems (illustrated by cinematograph film)," by Dr. A. Perl. "Transmission of power by belts," by H. W. Swift. "Effect of an electric field on the adsorption of ions at the interface of mercury and

solutions of electrolytes," by Dr. J. A. V. Butler. *Afternoon*.—Visit to works of Messrs. Rowntree, York. Visit to works of Messrs. Joseph Watson & Sons, Ltd., Leeds. "Influence of ultra-violet light on the structure of plants," by Miss A. Martin. "Influence of ultra-violet light radiation on the growth of plants," by Miss A. Westbrook.

Sept. 7. *Morning*.—"Repetition stresses on cast iron," by Prof. C. H. Bulleid.

The sectional officers for Section B—Chemistry are as follows:—

President.—Dr. N. V. Sidgwick, F.R.S. *Vice-Presidents*.—Dr. S. H. C. Briggs; Prof. J. B. Cohen, F.R.S.; Prof. R. W. Whytlaw Gray; Prof. J. F. Thorpe, C.B.E., F.R.S. *Recorder*.—Prof. C. S. Gibson. *Secretary*.—Dr. E. K. Rideal, and *Local Secretary*.—H. S. Patterson.

Sept. 2
to 12.

Sept. 6
to 9.

COKE OVEN MANAGERS' ASSOCIATION. Continental Tour. (See also p. 749.)

INSTITUTE OF METALS. Autumn Meeting to be held at Derby. On September 6, at 8 p.m., the Sixth Autumn Lecture on "Non-ferrous metals in modern transport" will be delivered by Dr. L. Atchison, in the Municipal Technical College. On September 7, a general meeting of members will be held at 10 a.m., and in the afternoon, at 2.30 p.m., visits will be paid to the Carriage and Wagon or Locomotive Works of the London, Midland and Scottish Railway Company, or Derby Crown China Works. On September 8, at 2.30 p.m., visits will be paid to the works of Messrs. Rolls-Royce, Ltd., or Messrs. Leys Malleable Castings, Ltd., or to Messrs. W. Bemrose & Sons, Ltd. (printing works). During the meeting the following papers will be read at the different sessions:—"Copper-magnesium alloys. Part II," by W. T. Cook and W. R. D. Jones; "Researches on intermetallic compounds. VI. The reaction between solid magnesium and liquid tin," by W. Hume-Rothery. "Age-hardening tests with elektron alloys," by K. L. Meissner. "Equilibrium diagram of copper-tin alloys containing from 10 to 25% of tin," by A. R. Raper. "Note on cathodic disintegration as a method of etching specimens for metallography," by C. S. Smith. "Protection of aluminium and its alloys against corrosion," by H. Sutton and A. J. Sidery. "Nature of the film produced by anodic oxidation of aluminium," by H. Sutton and J. W. W. Willstrop. "Grain growth in compressed metal powder," by C. J. Smithells, W. R. Pitkin and J. W. Avery. "The undercooling of some aluminium alloys," by Marie L. V. Gayler. "Constitution of alloys of aluminium with silicon and iron," by A. G. C. Gwyer and H. W. L. Phillips. "Effect of work and annealing on the lead-tin eutectic," by F. Hargreaves. "The system magnesium-cadmium," by W. Hume-Rothery and S. W. Rowell. "Constitution and physical properties of some of the alloys of copper, zinc and cadmium," by C. H. M. Jenkins.

Sept. 9. INSTITUTE OF BREWING, Research Fund Committee and Corporate Members. Visit to hop-growing districts in Kent. Luncheon will be held at Canterbury.

Sept. 12
to 14. INTERNATIONAL SOCIETY OF LEATHER TRADES' CHEMISTS. Bi-Annual Conference in London. (See CHEM. AND IND., August 12, p. 724.)

PERSONAL AND OTHER ITEMS

The Rev. T. B. Woodd has been elected Master of the Salters' Company, and Mr. W. N. Watson and Mr. G. C. R. Marshall of the Plaisterers' and Pewterers' Companies respectively.

Mr. Harold Moore, M.Sc.Tech., has been appointed consultant chemist to the National Lubricating Oil & Grease Federation.

Mr. J. D. Bernal, B.A., has been appointed University lecturer in crystallography at Cambridge.

Mr. G. Evans, C.I.E., M.A., has been appointed principal of the Imperial College of Agriculture, Trinidad. Mr. Evans has had wide agricultural experience in India and in Queensland.

Mr. J. V. N. Dorr, B.Sc., E.M., was recently awarded the degree of Doctor of Science by Rutgers University for his scientific attainments and the services he had rendered to the University, of which he is a governor. Dr. Dorr is at present in Europe visiting the Dorr organisations in London, Berlin, and Paris. He will return to New York at the end of September.

The Morehead medals of the International Acetylene Association have been presented at a banquet in New York to M. E. Fouché, who developed the first successful oxy-acetylene torch for cutting and welding, and to Mr. A. Davis, who contributed to the design of the medium pressure acetylene generator and of many accessory parts which are at the foundation of generator practice in the United States.

Mr. H. Skinner, president of the Pharmaceutical Society of Great Britain and Mr. T. Marns, a member of council, have left England en route for Canada and the United States, where they will study Canadian and American pharmaceutical legislation and conditions.

Prof. Bergmann, director of the Kaiser Wilhelm Institute for Leather Research at Dresden, is the new president of the International Society of Leather Trades Chemists.

A new beet-sugar factory is to be built during the autumn at Blunham, near Bedford.

The late Mr. S. H. Smith, who invented one of the first anti-gas compounds for use in the earlier forms of gas-mask during the war, left £4,045.

Judge E. H. Gary, the chairman and chief executive officer of the United States Steel Corporation, who was the leader of the amalgamation movement which reorganised the United States steel industry, has died at the age of 80.

The death is announced of Mr. C. A. Grasselli, president of the Grasselli Chemical Company, one of the largest chemical manufacturing firms in the United States.

The death is announced of Prof. B. B. Boltwood, professor of chemistry at York University, who was a prominent investigator in the field of radioactivity, and the discoverer of "ionium."

The death is announced of the distinguished physiologist, Prof. A. Kossel, who was emeritus professor of physiology and director of the Institute for Protein Research at Heidelberg. His early work was devoted to the constitution of the nucleic acids, and later, when

investigating the proteins of fish roe, he discovered histidine and developed the classical method for the quantitative separation of the hexone bases. One of his most distinguished pupils was H. D. Dakin, with whom he carried out important investigations on arginase. With his death biochemistry loses one of its foremost workers.

Mr. F. G. Skelton, late of Skelton Brothers, soap manufacturers, who died on March 5, left £53,168, with net personalty £44,562.

The late Prof. D. A. Gilchrist, until recently Professor of Agriculture at Armstrong College, Newcastle, left £22,442, with net personalty £22,015.

The late Mr. E. D. Gravill, managing director of William Hill, Ltd., manufacturing chemists, left £14,057, with net personalty £8913.

Coke Oven Managers' Association—Continental Tour

The following Itinerary has been arranged for the Continental tour of the Coke Oven Managers' Association: September 2.—Leave London, Liverpool Street, 20.30; Sail from Harwich, 22.00. September 3.—Arrive Hook of Holland, 5.30; Leave Hook of Holland, 7.20; Arrive Essen, 11.33. September 4.—Visit German Otto installation at Dahlhausen, also a new battery of 72 ovens under construction at Bruchstrasse. September 5.—Visit to Bruckhausen works of Messrs. Thyssen by the invitation of the Koppers Co., also the Koppers Silica Brick Works at Dusseldorf. September 6.—Leave Essen, 11.17; Arrive Cologne, 12.56; Depart Cologne, 14.10; Arrive Brussels, 19.20. September 7.—Visits to the State Mines at Heerlem (Holland) by the invitation of the Coppee Co., and (in the afternoon) to the Maurice Mine. September 8.—Visit the Piette installation at Alliance Monceau, near Charleroi, at the invitation of the Semet-Solvay & Piette Co., Ltd.; in the afternoon visit the new Becker installation at Chateaucneau, near Charleroi, at the invitation of the Woodall-Duckham Co. September 9.—Visit the Carl Still benzol plant at Jette-St.-Pierre, Brussels, in the morning; in the afternoon leave Brussels, 16.52; arrive Lille, 20.10. September 10.—Visit the synthetic ammonia works at Waziers, near Douai, by invitation of Messrs. Simon Carves, Ltd.; in the afternoon proceed by charabanc to Ostend. September 11.—Visit the synthetic ammonia installation and new Semet-Solvay battery at Ostend in the morning; the afternoon and evening will be free. September 12.—Depart Ostend, 10.30, via Dover for London. Arrive London, 16.30.

Research Association of British Paint, Colour, and Varnish Manufacturers

The Research Station and Laboratories of the above Association will be officially opened at an inaugural luncheon, to be held at the Clarence Hotel, Teddington, on September 21 at 1 p.m., which will be attended by a number of distinguished guests.

Potash from Palestine

Mention was recently made in CHEMISTRY AND INDUSTRY (July 22, 1927, p. 659) of the invitation of the Colonial Office and the Palestine Government for tenders for concessions to recover the vast chemical resources of the Dead Sea. It is now understood that

negotiations between the Crown Agents for the Colonies and certain British principals have reached an advanced stage, but no public announcement can be made until certain questions of detail have been settled. The realisation of the project is likely to have an important influence on economic conditions in Palestine. If it results in a large export trade in potash, it is probable that the Hedjaz railway which runs straight through Transjordan territory from north to south will eventually link up the Dead Sea with the Gulf of Akaba, and thereby create a trade route to India and the Far East, independent of the Suez Canal with its heavy dues. It is estimated that the quantities of salts in the Dead Sea, in millions of metric tons, are as follows: -Potassium chloride, 2,000; magnesium bromide, 980; sodium chloride, 11,900; magnesium chloride, 22,000; calcium chloride, 6,000. For practical purposes the supply of potash may be considered inexhaustible. The salts will be extracted by a system of evaporation and crystallisation in three principal stages. Firstly, the common salt will be crystallised out and the mother liquors drained off into the carnallite crystallising tanks. Secondly, the carnallite will be crystallised and the mother-liquor drained off and allowed to flow back into the Dead Sea unless required for the production of magnesium, calcium chloride, and bromide. Thirdly, the carnallite will be dissolved in water and concentrated in a pan until the potassium chloride crystallises out, first, in very pure crystals—probably until at least 50% of the total potash has separated—after which sodium chloride will come down with it. When the stage is reached that the final potassium chloride product would be less than 80% purity, were evaporation to be continued, the mother-liquor will be run off for crystallisation of the second fraction in a second potash pan. The potash will then be piled to drain and exposed to the sun and air until the salt is sufficiently dry to handle. For every ton of 80% potash, five tons of common salt will be produced, and if the production of potash ever reaches 100,000 tons, the disposal of 500,000 tons of salt will have to be considered. For every 100,000 tons of potash produced, 40,000 tons of bromide will be returned to the Dead Sea, the greater part of which will be in the second mother-liquor after the crystallisation of the carnallite. Three possible means of transport from the Dead Sea to the Mediterranean coast have been under consideration: a railway constructed up the Jordan Valley to join the Damascus-Haifa railway at Beisan; an aerial ropeway to Jaffa over the Judean hills; and a rope railway to Beisan or Jerusalem. As it has been decided to build a regular port at Haifa, it is anticipated that an electric railway will be constructed from the Dead Sea to Beisan, to join up with the existing line from Damascus to Haifa.

The Dating of Patents

The Committee appointed by the President of the Board of Trade to inquire into the dating and sealing of patents has issued its report. The Committee considers that no change is desirable in the existing practice in the United Kingdom as to the dating and sealing of patents. If, however, for any reason it should be considered expedient to make a change, the Committee recommends that such change should be limited to an alteration in

the term of the patent whereby the fixed portion of the monopoly period would run from the filing of the complete specification.

Survey of Empire Oils and Minerals

In order to assist in the development of the mineral resources of the Empire, an investigation, financed jointly by the Australian Government and the Empire Marketing Board, is to be undertaken into the methods of surveying for oils and minerals within the Empire. The work will be conducted under the guidance of a competent expert, and will probably take two years to complete. Within the Empire there are large areas of proved metalliferous value, in which the natural outcrop of the rocks is obscured by an overlying blanket of recent geological age, which in many cases is comparatively shallow, but renders the task of the geologist and of the prospector both difficult and expensive. During recent years certain methods, known as geophysical methods, have been evolved for detecting the possible existence of minerals or oils without the necessity of boring. Other methods have also been suggested, and to a certain extent tested, and it is thought that if complete information as to the possibilities and limitations of these methods, both individually and in conjunction, could be obtained, the development of the mineral resources of the Empire might be greatly assisted.

Tar Products in the Black Country

During the last few years research has been proceeding with a view to the fuller commercial exploitation of tar products at the works of the South Staffordshire Mond Gas Company at Dudley Port, and as a result of a recent investigation of the potentialities of their by-products, the company sought Parliamentary powers for giving wider scope to their activities which would enable them to manufacture and deal in chemical products which, it was claimed, would open up a new era in certain directions (cf. CHEM. AND IND., July 22, 1927, p. 671). It is stated that the tar derived from the manufacturing processes at Dudley Port is quite different from that which is obtained from the manufacture of town gas. As a result of investigation of its properties, a substance was produced which was found to be superior to creosote as a preservative of timber, was an effective protection against the ravages of the white ant, and was a preservative against dry rot. Another discovery of the research staff was that by blending different varieties of bitumen and reducing them to a colloidal state, a paint could be obtained which resisted corrosion in iron and steel. Another derivative provided a powerful germicide, which, being non-poisonous and non-irritant, is free from the objections to ordinary coal-tar disinfectants. Preparations are being made for turning these new discoveries to commercial use, thus bringing about important industrial developments in the Black Country.

The Constitution of Lead

In a letter to *Nature* (Aug. 13, 1927), Dr. F. W. Aston states he has succeeded in obtaining the mass spectrum of ordinary lead, using its tetramethyl compound. The three principal lines are 206 (4), 207 (3), 208 (7), the relative intensities (roughly expressed by the figures in brackets) being in good agreement with

the atomic weight, 207.2. Indications were obtained that other isotopes, 203, 204, 205, may be present in small proportions, but certain proof will only be available when mercury can be eliminated from the discharge. The mercury lines were more intense than any previously obtained, and indicate the presence of a seventh isotope, present to the extent of 0.04%.

Gaseous Helides

Mr. D. M. Morrison writes from the Cavendish Laboratory, Cambridge, to *Nature* (Aug. 13, 1927) to record evidence for the formation of gaseous helides when helium, excited by an electrodeless discharge, was passed over a strong radioactive source of radium B and radium C. It is considered probable that gaseous helides analogous to Paneth's hydrides can be formed.

Patents in the Irish Free State

After October 1, when the new Patents and Trade Marks Act comes into force in the Irish Free State, British patents and trade marks will no longer hold force unless fresh patents and trade marks are taken out in that country. British patents granted before December 6, 1921, will, however, be continued on the Irish register, if a copy of the patent or mark is lodged in Ireland and renewal fees paid. British patents and marks granted after December 6, 1921, and before the passing of the Act, will be granted, subject to search in the Irish register.

Soapstone Industry in Canada

Canadian sulphate pulp mills use some 2,500 tons of soapstone a year in the form of sawn blocks and bricks for building the furnaces used in recovery of the alkali or black liquor from the digestors, as soapstone is the only natural product known that will satisfactorily resist the action of the molten alkali. Since the recovery of such alkali is of great moment in kraft-mill practice, it follows that soapstone is a very important material to the pulp mill operators.

Prior to 1922 little attention had been directed towards developing a domestic supply of soapstone, and the requirements of the mills were met entirely by imported stone. In 1922 the Mines Branch in a published report (Memorandum Series No. 4) drew attention to what appeared to be a promising deposit of soapstone in the Lake of the Woods region, in Western Ontario. Following this, two companies were formed to exploit soapstone in this region, but these have not so far commenced operations. A third company, however, started work in 1924 in the same district.

In the Province of Quebec, however, the most active development has been undertaken, operations here having been helped by the fact that many of the largest kraft mills are situated in the Province, within a relatively short rail haul from the deposits. Production has, in the main, been confined so far to a single operator, the Robertsonville Soapstone Quarry Company, which has opened up a number of small quarries in the eastern portion of the serpentine belt, with which are associated the principal asbestos mines. Work is at present confined to a single quarry, where the stone has been found to be of superior quality to that hitherto worked. It is the intention of the company to undertake operations on a larger scale, and to grind the quarry waste, making products suited to the roofing and foundry trades.

Starting with an initial production of 167 tons in 1922, the industry had grown to 768 tons in 1925, with the probability that 1926 will show a still further increase. The greater proportion of the output hitherto has come from the Province of Quebec.

While a certain amount of soapstone continues to be imported from the United States and from Scandinavian countries, it is gratifying to note that Canada seems now well on the way to filling her requirements in respect of this material from within her own borders.

Nitrogen Fixation in the U.S.A.

A large nitrogen-fixation factory is to be built at Hopewell, Va., by the Atmospheric Nitrogen Co. at a cost of over 5 million dollars for the steam-electric power plant alone.

U.S. Potash Output in 1926

Potash produced in the United States in 1926 amounted to 46,324 short tons of crude potash salts containing 23,366 short tons of potash (K_2O), according to the U.S. Bureau of Mines. Sales by producers amounted to 51,369 tons of crude potash, containing 25,060 tons of K_2O . Potash materials of domestic origin sold by producers in 1926 were valued at \$1,083,064 f.o.b. plants. About 26,000 tons of crude potash, with an available content of 9000 tons K_2O , remained in stock at December 31, 1926. The production was chiefly from natural brines in California and distillery residue from molasses in Maryland. Small amounts were also obtained from steel plant dust in Pennsylvania, alunite in Utah, and glauconite in Delaware.

Salt in the U.S.A. in 1926

The production of salt in the United States in 1926 was 7,371,600 short tons, valued at \$25,056,012, a decrease of 1% in quantity and 4% in value. The salt content of the brine used in producing chemicals was 3,037,820 short tons, an increase of 8%. Bromine recovered from natural brines amounted to 1,245,760 lb. (\$426,837), a decrease of 2%, whilst 82,340 s.t. (\$1,710,405) of calcium chloride was recovered, representing an increase of 21%.

Soil Oxygen

At the Washington meeting of the International Congress of Sciences, Dr. L. M. Hutchins (U.S. Department of Agriculture) described an apparatus with which he determines the oxygen-supplying power of the soil. Nitrogen is passed through a porous porcelain vessel buried in the soil and the outgoing gas is passed through a solution which changes colour in accordance with the amount of oxygen which has passed through the porous porcelain and mixed with the nitrogen.

Chromium-plating in the U.S.A.

The General Chromium Corporation has been formed by the old General Chromium Corporation, the General Motors Corporation, the Union Carbide & Carbon Corporation, and the Vacuum Pan Co. to consolidate patents, research laboratories, experience and facilities for the process of chromium plating known as "Duro-Chrome." A plant is now being operated at Detroit, Michigan, for commercial plating work, and research work is being carried out in the laboratories of the participating concerns.

REVIEWS

CHEMICAL REFLECTIONS. By STEPHEN MIALL. Pp. 39.
London: Ernest Benn, Ltd., 1927. Price 1s.

We have here a reprint in pamphlet form of thirty of the weekly editorials which have appeared in this JOURNAL during the last four years. All who have appreciated the articles will be glad to see them issued in a collected form. The only likely complaint is that the form is hardly worthy of the substance, and probably many readers will think that, without going to the excesses of ragged-edged hand-made paper and expensive fonts of type, we might yet have had, at no seriously increased price, something looking a little more like a book of essays. There would have been a better chance for the collection to get outside chemical circles. Undoubtedly there is a growing desire among the lay-public to learn more about the ways of the scientific world, and it is a desire that should be met. There is a great deal in the present collection to enlighten and entertain such readers. Further than this, constant complaint is made that science cannot get itself put into any passable sort of literary currency. A young Oxford writer discussing recently whether history should be an art or a science said that "if by being called a science history was condemned to be written about like other sciences by total illiterates he did not agree." It would be good for this young man to read the articles before us. At the same time we must admit that they are of a type that is not common within scientific circles. They are indeed remarkable most of all for their originality and individuality in the use of literary art for associating the interests of science and applied science with the general topics that interest most mankind. The articles are highly distinctive, and we can hardly expect that the qualifications for doing this kind of thing as it is done by Dr. Miall will often be found. But all those who are intent upon making the work and the aims of science better known to the multitude may at least take a leaf out of his book. We certainly need to improve our literary ways and acquire more of the art of explaining ourselves to those who do not understand the language of science. We do not mean to suggest that there has been any studied artifice or severe mental exertion involved in writing the articles before us. They have, on the contrary, the character of spontaneity, and will be valued most by his friends for reflecting so vividly the personality of the author as he is known in the intimacy of private life.

A survey of the titles of the articles now reprinted suggests a make-up of our Editor hardly less complex than that of Gilbert's heavy dragon. He writes upon gardens, holidays, the general election, the English language, education, the art of writing, science and religion, and his chemistry ranges over the whole science and its applications. Like Silas Wegg with poetry he "drops" with sudden ease into languages ancient and modern, and like Silas can, if necessary, connect his commentary with the Rise and Fall of the Rooshian Empire. He seems to take pleasure in holding over us the threat of irrelevance or indiscretion.

It would be improper to proceed in this place with any criticism or appraisal of the editorial articles.

What has been said above was not intended to be more than impartially descriptive. The articles are provocative in many ways. They are a very notable feature of our JOURNAL, and give rise to a good deal of discussion. They import an element of liveliness unusual in scientific periodicals. They raise questions of policy and opinions on which opinion may differ, but everyone will acknowledge the absence of dogmatism, and the readiness of the Editor to give space to his critics, as well as the sincerity and kindness pervading everything that comes from his pen.

A. SMITHIELLS

A SHORT HAND-BOOK OF OIL ANALYSIS. By DR. A. H. GILL. Eleventh edition, revised and enlarged. Pp. 293. London: J. B. Lippincott Co., 1927. Price 18s.

It is quite clear that any book which runs through ten editions, and of which an eleventh is required, has fulfilled a useful purpose. This one has, however, certain defects which are possibly explained by a statement on the wrapper that it is "one of the few chemical books which is simple enough to be taken up without immediately previous preparation in the intervals of an engineer's work."

The major portion of the book is given over to the testing of motor spirits and lubricants. The methods given are based on the American standard methods, and these are well described, many useful comments being made. As the methods involved are, of necessity, mostly physical ones, it may be possible for chemical engineers to carry them out "without immediately previous preparation."

In the case of the fatty oils, however, a different conclusion must be reached. The examination of fatty oils is often of such difficulty that experienced workers have to use the utmost caution in giving definite reports. Where experience is lacking this section of the book will not be of much assistance, but it may provide a useful summary if used under skilled supervision. This, possibly, is the idea the author has in mind, as he is the Professor of Technical Analysis at Massachusetts, and the Preface states that the book was originally written for the author's own classes. There is need of some revision, however, even for this purpose, in several such cases, for example, as the recommendation to measure Harius iodine solution and N/2 alcoholic potash from a burette to weigh "one or 5 c.c. of oil carefully measured from an accurately calibrated pipette" in order to determine accurately its specific gravity—and certain descriptions of tests such as the Valenta, where we find "Enough oil is poured into a test-tube to fill it to the depth of about one inch, the exact height being marked by the thumb, an equal quantity of glacial acetic acid is poured in, that is, until the acid reaches the point indicated by the thumb," and where no reference is made to the valuable work of Fryer and Weston.

The book is almost free from misprints; it is attractively bound and well printed on good paper. The rough surface of the paper has, however, resulted in many of the diagrams being somewhat poorly reproduced.

COMPANY NEWS

SOUTH METROPOLITAN GAS COMPANY

The South Metropolitan Gas Company announces a dividend of 5% per annum, less tax, on the ordinary stock, payable on September 3. For several years the interim payment has been the same as above.

WALKERS PARKER & CO.

The directors state that the trading results for the past half-year of this lead and shot manufacturing company have been unsatisfactory, and show only a small profit. It has, however, been decided to continue the interim dividend of 6d. per share, less tax, payable September 30, in view of the amount of undivided profits accumulated in previous years.

THE INTERNATIONAL NICKEL COMPANY

The earnings of this company for the six months ended June 30, 1927, amount to \$4,217,162, against \$4,267,576 for the first half of 1926; other income gave \$40,020, against \$85,888, making the total income \$4,287,183, compared with \$4,353,464. Administration and general expenses absorbed \$304,001, reserved for Federal and franchise taxes \$326,024, leaving net operating income of \$3,657,157, compared with \$3,597,162. Depreciation and depletion took \$799,706, and Orford works property expense was \$54,820, the profit on the period thus being \$2,802,630, against \$2,774,689. Preferred dividends absorbed \$267,378, and common dividends \$1,673,384, leaving \$861,868, against \$833,927.

THE STANDARD CHEMICAL COMPANY

The report of the Standard Chemical Company for the year ended March 31, 1927, shows profits of \$194,979, compared with \$34,835 for 1925-26. After deducting \$30,303 for interest on bonds and debentures and \$160,000 for depreciation (as compared with \$75,000 last year), net profit was \$4,676, compared with net loss of \$73,580. During the year the funded and mortgage debt was reduced by \$61,846, and current liabilities by \$54,813, making a total reduction of \$116,660. The current assets show an increase of \$112,872. Total sales were \$1,634,657, and 40,182 cords of wood were carbonised, an increase of \$117,262 and 428 cords respectively over the previous period. In consequence of the improved financial position of the company, coupled with the recent amendment to Dominion Companies Act, the directors are now in a position to recommend a scheme of capital readjustment.

TAYLORS (CASH CHEMISTS) TRUST, COMPANY

Announcement is made of a first interim dividend of 10% on the deferred ordinary shares, payable on August 31. The company has an authorised capital of £1,000,000, of which £120,000, in 2,400,000 deferred shares of 1s. each, was issued in March last.

KAHLBAUM A.-G.

The C. A. F. Kahlbaum A.-G., which amalgamated with the Schultheiss-Patenthöfer Brauerei A.-G. in 1926, has now amalgamated with the Hartwig Kautowicz A.-G., a firm which is connected with the wine and spirit trade, to form a new company, the Hartwig Kautowicz-C. A. F. Kahlbaum Co.

MARKET REPORT

This Market Report is compiled from special info received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.

Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.

Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.

Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.

Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 80s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.

Ammonia Alkali.—£8 15s. per ton, f.o.r. Special terms for contracts.

Bisulphite of Lime.—£7 10s. per ton, packages extra.

Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.

Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)

Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.

Copper Sulphate.—£25—£25 10s. per ton.

Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.

Nickel Sulphate.—£38 per ton d/d.

Nickel Ammon. Sulphate.—£38 per ton d/d.

Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.

Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.

Salt Cake.—£3 15s.—£4 per ton d/d. bulk.

Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.

Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.

Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.

Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.

Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.

Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot

£8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod.

Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.

Arsenic Sulphide, Yellow.—1s. 9d. per lb.

Barytes.—£3 10s.—£6 15s. per ton, according to quality.

Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.

Carbon Bisulphide.—£20—£25 per ton, according to quantity.

Carbon Black.—6½d. per lb., ex wharf.

Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.

Chromium Oxide, Green.—1s. 1d. per lb.

Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.

Lamp Black.—£35 per ton, barrels free.

Lead Hyposulphite.—9d. per lb.

Lithopone, 30%.—£22 10s. per ton.

Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d. 7d. per lb., carboys extra.

Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.

Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Grey, £15 per ton. Liquor, 9d. per gal. 32° Tw.

Charcoal.—£6—£9 per ton according to grade and locality.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liquor.—9d.—10d. 16° Tw. per gal.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 4s.—4s. 1d. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.

Wood Tar.—£4 10s.—£5 per ton and upwards, according to grade.

Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolie.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 6d.—2s. 8d. per gal.

Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 1½d.—2s. 3d. per gal. Pale, 95%, 2s.—2s. 1½d. per gal. Dark, 1s. 9d.—1s. 10d. per gal.

Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.

Benzole.—Crude 65's, 10d.—10½d. per gal., ex works in tank wagons; Standard motor, 1s. 3d.—1s. 3½d. per gal., ex works in tank wagons; Pure, 1s. 6d.—1s. 7d. per gal., ex works in tank wagons.

Toluene.—90%. 1s. 4d.—1s. 9d. per gal. Pure, 1s. 7d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 2s. 5d. per gal.

Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Standard specification, 7½d.—7½d. per gal. Middle Oil, 9d.—10d. per gal. Heavy, 8½d.—8½d. per gal. Salty, 7d. per gal., less 1½%.

Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/160, 1s. 2d.—1s. 4d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, 1s.—1s. 4d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.

Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—88s. 9d.—92s. 6d. per ton, f.o.b. according to district.

Pyridine.—90/140.—5s. 9d.—7s. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.

Acid H.—3s. 3d. per lb. 100% basis d/d.

Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.

Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilio.—9d. per lb. 100% basis d/d.

Aniline Oil.—7½d. per lb., naked at works.

Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.

Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—4½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—2s. 3d. per lb.

Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.

Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.

Dinitrochlorobenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—11d.—1s. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb. d/d.

β-Naphthylamine.—3s. per lb. d/d.

p-Nitraniline.—1s. 8d. per lb. d/d.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb. d/d.

R. Salt.—2s. 2d. per lb. 100% basis d/d.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d. per lb., naked at works.

p-Toluidine.—2s. 2d. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—20 cwt. lots. Cryst. 40s. per cwt. Powder 44s. per cwt. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 7½d.—1s. 8d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 5d. per lb. Technical 11½d.—1s. per lb.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—11s. per oz. for English make.

Barbitone.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth

Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—

8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—

8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb.

Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Sub-

chloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—

7s. 9d.—8s. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liquor

Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.

—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—20 cwt. lots. Crystal 24s. per cwt. Powder 26s.

per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d.—2s. 6d. per lb. Potassium. 1s. 10d.—2s. 1d. per lb. Sodium.—2s. 1d.—2s. 4d. per lb. Granulated $\frac{1}{2}$ d. per lb. less. All spot.

Calcium Lactate.—1s. 2 $\frac{1}{2}$ d.—1s. 3 $\frac{1}{2}$ d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 6d. per lb., duty paid.

Chloroform.—2s. 3d.—2s. 7 $\frac{1}{2}$ d. per lb., according to quantity.

Creosote Carbonate. 6s. per lb.

Ethers. Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2 $\frac{1}{2}$ d.; 1s. 2d.; 1s. 1 $\frac{1}{2}$ d.; 1s. 0 $\frac{1}{2}$ d.; 720 tech.—1s. 5 $\frac{1}{2}$ d.; 1s. 5d.; 1s. 4 $\frac{1}{2}$ d.; 1s. 3 $\frac{1}{2}$ d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3 $\frac{1}{2}$ d.; 2s. 3d.; 2s. 2d.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiaicol Carbonate.—5s. per lb.

Hexamine.—2s. 4d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., bulk 2s.—2s. 3d. per gal.; Winchester, 2s. 11d.—3s. 6d. per gal.; 20 vols., bulk 3s. 6d.—4s. 6d. per gal.; Winchester, 5s.—6s. per gal.

Hydroquinone.—2s. 11d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate. B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—3d.—4d. per lb., 22s. per cwt.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £82 10s. per ton, less 2 $\frac{1}{2}$ %; Heavy Commercial £21 per ton, less 2 $\frac{1}{2}$ %; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 10s. 6d.—12s. 9d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, R.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fino, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonal.—9s. 6d.—9s. 9d. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 9d.—3s. per lb.

Phenazone.—4s. 3d.—4s. 6d. per lb.

Phenolphthalein.—6s.—6s. 3d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2 $\frac{1}{2}$ % for ton lots.

Potass. Citrate.—R.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferriocyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 5d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).

Rosoroin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 9d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 8 $\frac{1}{2}$ d.—1s. 10d. per lb. Crystal, 1s. 9 $\frac{1}{2}$ d.—1s. 10 $\frac{1}{2}$ d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.

Sulphonal.—6s. 6d.—6s. 9d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.

Thymol, Puriss.—10s. 6d.—11s. 6d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (ex Anethole).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 17s. per lb.

Coumarin.—10s. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. 6d. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.

Camphor.—75s. per cwt. Cananga, Java, 26s. per lb. Cassia, 80/85%.—7s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure—6s. per lb.

Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%, 22s. 6d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—10s. 6d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 70s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 17s. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Oct. 11th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on August 26th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Chem. Fabr. Milch. Production of emulsifying and wetting agents. 20,358. Aug. 2. (Ger., 2.8.26.)

Cox. Centrifugal separators. 20,484. Aug. 3.
Drying Systems, Inc. Drying-ovens. 20,703. Aug. 5.
(U.S., 5,826.)

Eley. Furnaces. 20,298. Aug. 2.
Hannuch. Refrigerating-compounds. 20,563. Aug. 4.
Koff. Apparatus for mixing etc. liquids etc. 20,645.
Aug. 5.

Kolitsch. Separation of solid materials. 20,407. Aug. 2.
(Austr., 14,826.)

Manchester Oxide Co., Ltd., Clayton, and Scholefield.
Catalysts. 20,511. Aug. 4.

Wüst. Furnaces. 20,690. Aug. 5. (Ger., 6,826.)

I.—Complete Specifications

2158 (1926). Gilchrist & Co. Treatment of liquids.
(247,512.)

11,132 (1926). Schucker. Apparatus for the hydrogenation
of liquids and semi-liquids. (274,952.)

11,210 (1926). Altenheim (Klem). Separation of liquids
from solids. (274,958.)

12,640 (1926). Dessauer. Apparatus for quantitative
analysis with the aid of Röntgen or cathode rays. (252,207.)

24,435 (1926). Trocknungs-, Verschweißungs- und Vergas-
ungs-Ges., Homgmann, and Bartling. Annular ovens or
furnaces with rotary hearths. (275,041.)

3467 (1927). Holmes, Henshaw, and Holmes & Co., Ltd.
Apparatus for bringing liquids and gases into intimate
contact. (275,092.)

*15,622 (1927). Steam Production Corp. Furnaces.
(275,177.)

*15,698 (1927). Piron. Distillation process. (275,178.)

*18,523 (1927). Rosenheim. Adsorbing-agent. (275,203.)

*19,531 (1927). Meyerhofer. Furnaces. (275,222.)

*19,944 (1927). Maschinfabr. Grevenbroich. Drying-
apparatus. (275,239.)

*20,079 (1927). I.-G. Farbenind. Supplying heat in
high-pressure reactions. (275,248.)

*20,358 (1927). Chem. Fabr. Milch. Producing and
employing purifying, emulsifying, and wetting agents.
(275,267.)

II.—Applications

Asiatic Petroleum Co., Barton, and Egerton. Fuel for
internal-combustion engines. 20,806. Aug. 6.

Ault and Wiborg Co. Treating hydrocarbons. 20,517.
Aug. 3. (U.S., 282,27.)

Bellay. Gas generator. 20,764. Aug. 6. (Belg., 11,826.)

Cezanne. Gas-producers. 20,467. Aug. 3.

Crawford, King, Lander, and Simmatt. Treatment of coal
etc. 20,595. Aug. 4.

Gardner. Manufacture of carbon. 20,403. Aug. 2.

Ges. f. Lände's Eismaschinen, and Soc. Anon. Métall. de
Sambé. Separation of benzol etc. from cokery gas etc.
20,513. Aug. 3. (Ger., 4,826.)

I.-G. Farbenind. Production of active masses containing
carbon. 20,354. Aug. 2.

Marchand. Apparatus for treating heavy hydrocarbons.
20,653. Aug. 5. (Fr., 5,826.)

Marion Steam Shovel Co. Production of fuel from oils etc.
20,376. Aug. 2. (U.S., 15,122.)

Parkes and Robinson. 20,722. See III.

II.—Complete Specifications

11,195 (1926). I.-G. Farbenind. Manufacture of active
carbon. (251,636.)

11,212 (1926). Tinker. Distillation of crude oils.
(274,959.)

19,637 (1926). Vickers, Ltd., and Berger. Combustible
compositions for pyrotechnic, smoke- and flame-producing
and other like purposes. (275,021.)

7742 (1927). Northrup. Conversion of heavy hydro-
carbon oils into lighter oils. (275,120.)

*4916 (1927). Suida. Recovery of concentrated acetic
acid and other products in carbonisation of wood.* (275,158.)

III.—Applications

Ges. f. Lände's Eismaschinen and Soc. Anon. Métall. de
Sambé. 20,513. See II.

Parkes and Robinson. Removal of tar acids from ammonia
liquor etc. 20,722. Aug. 5.

III.—Complete Specification

11,212 (1926). Tinker. See II.

IV.—Applications

Carmichael (I.-G. Farbenind.). Manufacture of sulphur
dyestuffs. 20,610. Aug. 4. Manufacture of vat dyestuffs of
anthraquinone series. 20,415. Aug. 2.

I.-G. Farbenind. Manufacture of amidated sulphurised
benzanthrone derivatives. 20,409. Aug. 2. (Ger., 2,826.)
Condensation products of anthraquinone series. 20,583.
Aug. 4. (Ger., 4,826.)

Imray (Soc. Chem. Ind. in Basle). Manufacture of azo
dyestuffs. 20,582. Aug. 4.

Johnson (I.-G. Farbenind.). Production of aromatic
amines from nitro compounds. 20,575. Aug. 4.

IV.—Complete Specifications

11,196 (1926). I.-G. Farbenind. Manufacture of disazo
dyestuffs. (251,637.)

11,311 (1926). Durand & Huguenin. Manufacture of
acid dyestuffs of the rhodamine series. (251,644.)

11,321 (1926). Carmichael (I.-G. Farbenind.). Manu-
facture of leuco-oxyanthraquinones. (274,966.)

15,586 (1926). Imray (I.-G. Farbenind.). Manufacture of
dyestuffs. (274,999.)

*30,872 (1926). Fabr. de Prod. Chim. Rohner. Manu-
facture of dyestuffs. (275,147.)

*19,493 (1927). Geigy A.-G. Manufacture of azo dye-
stuffs. (275,220.)

*19,986 (1927). I.-G. Farbenind. Manufacture of stable
diaz-salt preparations. (275,245.)

*20,194 (1927). I.-G. Farbenind. Manufacture of azo
dyestuffs. (275,258.)

*20,409 (1927). I.-G. Farbenind. Manufacture of amid-
ated sulphurised benzanthrone derivatives. (275,271.)

V.—Applications

Bemberg, A.-G. Production of artificial silk. 20,602.
Aug. 4. (Ger., 5,826.)

British Dyestuffs Corp., Adams, and Shephardson. Manu-
facture of products from lignin sulphonic acid. 20,490.
Aug. 3.

Elod. Production of cellulose esters. 20,617. Aug. 4.
(Ger., 9,826.)

Hetherington & Sons, Ltd., and Carle. Production of
artificial filaments etc. 20,308. Aug. 2.

I.-G. Farbenind. Application of cellulose ethers etc.
20,708. Aug. 5. (Ger., 23,122.)

Wright. Manufacture of artificial silk. 20,601. Aug. 4.

V.—Complete Specifications

8426 (1926). Brysilka, Ltd., and Schubert. Washing and
conditioning artificial silk. (274,928.)

10,691 (1926). Kershaw, Barrett, Parker, and Bleachers
Assoc., Ltd. Treatment of cellulosic materials. (274,940.)

24,585 (1926). Courtaulds, Ltd., Shedden, Delph, and
Baguley. Manufacture of artificial silk. (275,042.)

VI.—Applications

Chem. Farb. Milch. 20,358. See I.

Flesch. Application of highly sulphonated oils in the
textile industry. 20,572. Aug. 4. (Ger., 261,27.)

Moreton, and Prufix, Ltd. Waterproofing textiles etc.
20,656. Aug. 5.

Schoenfeld. Wet treatment of textile threads. 20,717.
Aug. 5.

VI.—Complete Specifications

1388 (1926). I.-G. Farbenind. Treatment of fibrous materials and textiles. (246,468.)

*19,711 (1927). I.-G. Farbenind. Producing yellow dyes on cellulose esters or ethers. (275,230.)

*19,986 (1927). I.-G. Farbenind. *See* IV.

*20,358 (1927). Chem. Fabr. Milch. *See* I.

VII.—Applications

Anderson, Cash, and Stephens. Manufacture of titanium oxide. 20,422. Aug. 2.

Gareau. Production of alumina, soda, and hydrochloric acid. 20,522. Aug. 3.

Gülker. Production of hydrogen. 20,432. Aug. 2. (Ger., 30.7.26.)

Mond (I.-G. Farbenind.). Production of alumina etc. 20,567. Aug. 4.

VII.—Complete Specifications

1330 (1926). Soc. L'Air Liquide. Manufacture of formates. (246,186.)

2666 (1926). Fielding. Manufacture of sulphuric acid. (274,918.)

2667 (1926). Fielding. Production of sulphuric acid from sulphur dioxide. (274,919.)

7966 (1926). Meyerhofer. Decomposing salts of complex hydrofluoric acids. (249,860.)

25,249 (1926). Wiley and Mensing. Granular caustic alkali (275,044.)

6220 (1927). I.-G. Farbenind., and Stalib. Converting oxides into anhydrous fused chlorides. (275,116.)

10,669 (1927). Urbain Corp. Recovery of phosphorus and hydrogenated compounds thereof in the form of phosphoric acid. (269,908.)

*29,350 (1926). Wittek. Extracting metalloids from their compounds. (275,145.)

*4916 (1927). Suida. *See* II.

*20,432 (1927). Gülker. Producing hydrogen (275,273.)

VIII.—Complete Specifications

25,900 (1926). Marlow. Tunnel ovens or kilns for tiles, pottery, etc. (275,048.)

8609 (1927). British Thomson Houston Co., Ltd. Producing silica articles. (268,780.)

IX.—Complete Specifications

11,170 (1926). Colas Products, Ltd., and Levy. Bituminous paints etc. (274,955.)

32,251 (1926). Schantz. Preserving wood. (264,473.)

X.—Applications

Coley. Manufacture of zinc. 20,348. Aug. 2. Apparatus for reduction of ores etc. 20,512. Aug. 3.

Warren and Warren. Coating with metals. 20,387. Aug. 2.

Zähler & Schiess & Co. Lead coating. 20,317. Aug. 2. (Ger., 30.8.26.)

X.—Complete Specifications

11,146 (1926). Strasser. Coating iron or iron alloys with metals. (255,417.)

16,273 (1926). Zwiebel. Protecting iron or steel melts in furnaces or converters. (275,002.)

30,706 (1926). Fourment. Treatment of ores, oxides, metals, etc. (265,548.)

4112 (1927). Lucas. Purifying iron scale. (275,099.)

*20,349 (1926). Wittek. Reducing ores. (275,144.)

*19,608 (1927). Siemens & Halske A.-G. Electrical depositing of chromium. (275,223.)

*19,807 (1927). General Electrical Co., Ltd., and Weintraub. Metallic coatings. (275,233.)

XI.—Applications

Bosch A.-G. Electric storage batteries. 20,447. Aug. 3. (Ger., 11.1.27.)

British Thomson-Houston Co., Martin, Smith, and Warren. Insulating material. 20,514. Aug. 3.

Neale. Selenium cells. 20,743. Aug. 6.

Schuster. Voltaic cells. 20,584. Aug. 4. (Ger., 5.1.27.)

XI.—Complete Specifications

10,318 (1926). Kodak, Ltd. Electrical deposition of organic materials. (251,271.)

11,888 (1926). Wade (Philips Gloeilampenfabr.). Oxide cathodes. (274,981.)

17,021 (1926). Haddon and Burnett. Accumulator plates. (275,010.)

3133 (1927). Wreschner and Loeb. Manufacture of a preparation which emits β -rays. (265,600.)

7311 (1927). Pechkranz. Electrolyser diaphragms of the filter-press type. (271,043.)

*19,608 (1927). Siemens & Halske A.-G. *See* X.

*20,081 (1927). Siemens & Halske A.-G. High-frequency induction furnaces. (275,249.)

XII.—Applications

Flesch. Production of sulphonated oils etc. 20,573. Aug. 4. (Ger., 23.12.26.)

Overstraten. Extracting fatty materials from waste waters. 20,493. Aug. 3. (Belg. 6.8.26.)

XII.—Complete Specifications

10,692 (1926). Kokatnur. Hydrolysis or saponification of glycerides or other esters. (251,290.)

10,966 (1926). Jirotko. Production of margarine and like edible fats. (274,949.)

11,132 (1926). Schueler. *See* I.

XIII.—Applications

I.-G. Farbenind. Colouring lacquers. 20,352. Aug. 2. (Ger., 13.8.26.) Varnishes. 20,707. Aug. 5. (Ger., 23.12.24.)

XIII.—Complete Specifications

4598 (1926). Pollak. Manufacture of condensation products of urea or its derivatives and formaldehyde. (248,729.)

11,170 (1926). Colas Products, Ltd., and Levy. *See* IX.

31,038 (1926). Giovagnoli. Submarine paints. (262,486.)

*19,844 (1927). Rostschutz-Farbw. Liebreich. Manufacture of rust-preventing oil paints. (275,234.)

XV.—Applications

Clifford. Dehairing skins etc. 20,502. Aug. 3.

Flesch. Use of sulphonated oils in tanning. 20,574. Aug. 4. (Ger., 27.12.26.)

Robinson. Treatment of leather. 20,714. Aug. 5.

XV.—Complete Specification

13,945 (1927). Botson. Treatment of hides and skins preliminary to tanning. (272,195.)

XVI.—Applications

Johnson. Production of fertilisers. 20,680. Aug. 5.

Tyrer. Manufacture of fertilisers. 20,408. Aug. 2.

XVI.—Complete Specification

11,541 (1926). Saccharin-Fabr. A.-G., and Klages. Preserving seeds from attack by pests etc. (274,974.)

XVIII.—Complete Specification

3357 (1927). Hansen, and Nathan. Pasteurising beer. (275,090.)

XIX.—Applications

Robertson. Preserving perishable products. 20,578. Aug. 4. (N.Z., 24.8.26.)

Verity. Preserving etc. eggs etc. 20,744. Aug. 6.

XIX.—Complete Specifications

10,966 (1926). Jirotko. *See* XII.

*16,862 (1927). Food Chillers, Ltd. Conservation of meat, eggs, fruit, etc. (275,184.)

XX.—Applications

Chem. Fabr. vorm. Schering. Obtaining germ gland hormones. 20,727. Aug. 5. (Ger., 11.9.26.)

Flesch. Production of sulphuric esters of poly-oxy fatty acids. 20,571. Aug. 4. (Ger., 14,327.)

I.-G. Farbenind. Production of acetaldehyde from gaseous mixtures. 20,353. Aug. 2. (Ger., 28,926.) Manufacture of diamino-propanols. 20,472. Aug. 3. (Ger., 3,826.)

Imperial Chemical Industries, Ltd., and Horsley. Production of esters. 20,452. Aug. 3.

XX.—Complete Specifications

45,98 (1926). Pollak. See XIII.

10,092 (1926). Kokatnur. See XII.

11,213 (1926). Crawford and Willson. Production of hydroxylic compounds. (274,960.)

19,782 (1927). Canadian Electro Products Co., Ltd. Manufacture of lactic acid esters. (257,907.)

19,782 (1926). Canadian Electro Products Co., Ltd. Manufacture of lactic acid esters. (257,907.)

32,057 (1926). Canadian Electro Products Co., Ltd. Manufacture of hydroxy acid esters. (264,143.)

16,995 (1927). Hoffmann-La Roche & Co. Manufacture of a glucoside of *Adonis Vernalis* L. (265,941.)

*16,513 (1927). Eichellbaum and Atenburg. Increasing efficiency of preparations of animal organs. (275,183.)

*18,924 (1927). Chem. Fabr. vorm. Schering. Manufacture of iodine-substituted benzonitriles. (275,213.)

XXII.—Complete Specifications

19,637 (1926). Vickers, Ltd., and Berger. See II.

*19,682 (1927). Guthke. Manufacture of explosives. (275,228.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Austria and Succession States*: Drugs, perfumery (116). *Belgium*: Semi-finished metal products other than iron (117). *British India*: Steel boiler-plates, copper rod, copper tubes (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *British West Indies*: Drugs, chemicals (111). *Bulgaria*: Tin (A. 5022). *Canada*: Gas and oil cookers (Canadian Trade Commissioner, The Canadian Building, Trafalgar Square, London, S.W.1). *Germany*: Perfumery (118). *Holland*: Boiler materials, brass (121). *Hungary*: Electrical insulating materials (mica, mica-nite, synthetic resin, ebonite) (122). *Near East*: Drugs, perfumery (116). *New Zealand*: Steelwork (B.X. 3685–8); Newsprint (B.X. 3706). *South Africa*: Porcelain insulators, steel, iron (114); machine oil (B.X. 3692); electrically-driven centrifugal pump (A.X. 5021). *Switzerland*: Raw materials for chocolate factories and confectioners (127). *Turkey*: Constructional steelwork (128); galvanised iron wire (A.X. 5025).

Dried Milk Regulations

The Minister of Health is about to make regulations amending the Public Health (Dried Milk) Regulations, 1923, so far as they relate to the labelling of dried milk. The regulations will apply to all dried milk intended for sale for human consumption in England and Wales. Copies of the draft regulations can be purchased from H.M. Stationery Office, or through any bookseller (price 1d.). Any representations on the subject should be addressed to the Secretary to the Ministry at an early date.

Gas-making Plant

The Spalding Urban District Council has placed an order with the Woodall-Duckham Vertical Retort & Oven Construction Co. (1920), Ltd., for a further installation of Woodall-Duckham continuous vertical retorts. The new installation will comprise 6 unit retorts, and includes the necessary coal and coke-handling plant, and is arranged so that a waste heat boiler can be added at a later date. This is the second Woodall-Duckham continuous vertical retort plant to be erected at Spalding.

The Newmarket Gas Company has also placed an order with the Woodall-Duckham Vertical Retort & Oven Construction Co. (1920), Ltd., for an installation of Woodall-Duckham continuous vertical retorts. The installation comprises 6 unit retorts. The plant will be complete with coal and coke-handling plant and waste heat boiler, and will be similar in all respects to the continuous vertical plant recently erected for the Wisbech Lighting Co.

News from Advertisements

A single cylinder vacuum drying machine is for sale (p. v).

An old-established chemical business is for sale (p. v).

A private technical secretary is required by a chemical engineer (p. v).

Half-gallon and 1-gallon stone jars are offered for delivery in Great Britain and Ireland (p. v).

Situations are required by two young men (p. v).

There are 107 firms represented under the various headings in our Buyers' Guide.

PUBLICATIONS RECEIVED

THE INDUSTRIAL CHEMISTRY OF THE FATS AND WAXES. By T. P. Hilditch, D.Sc., F.I.C. With an introduction by E. F. Armstrong, D.Sc., LL.D., F.R.S. Pp. xv + 461. London: Baillicre, Tindall & Cox, 1927. Price 18s.

FLAME AND COMBUSTION IN GASES. By W. A. Bone, D.Sc., Ph.D., F.R.S., and D. T. A. Townend, Ph.D., D.I.C. Pp. xvi + 548. London: Longmans, Green & Co., Ltd., 1927. Price 32s.

BIBLIOGRAPHY OF PERIODICAL PUBLICATIONS ON PAPER-MAKING AND ALLIED SUBJECTS DURING 1925. Paper-makers' Association of Great Britain and Ireland, 1912 (Incorporated). December, 1925. Pp. 48. London: Papermakers' Association, 26, Farringdon Street, E.C.4. Price 5s.

REPORT OF THE DOMINION CHEMIST. By F. T. Shutt, M.A., D.Sc., for the Year ending March 31, 1926. Division of Chemistry. Dominion of Canada, Department of Agriculture, Dominion Experimental Farms. Pp. 102. Ottawa: F. A. Acland, 1927.

ALUMINIUM BRONZE POWDER AND ALUMINIUM PAINT. By J. D. Edwards. Pp. 104. New York: The Chemical Catalog Co., Inc., 1927. Price \$3.0.

ABRIDGED SCIENTIFIC PUBLICATIONS FROM THE KODAK RESEARCH LABORATORIES. Vol. X., 1926. Pp. 247 + xxvi. New York: Eastman Kodak Co., 1926.

ALLEN'S COMMERCIAL ORGANIC ANALYSIS. Vol. V. Edited by S. S. Sadtler, S.B., E. C. Lathrop, A.B., Ph.D., and C. Ainsworth Mitchell, M.A., F.I.C., and other contributors. Pp. xii + 700. Fifth edition, revised and in part rewritten. London: J. and A. Churchill, 1927. Price 30s.

EDITORIAL

The Empire Mining and Metallurgical Congress

THREE years ago the First Empire Mining and Metallurgical Congress was held in Wembley under the presidencies of the Prince of Wales and the late Viscount Long. The glories, though not the results, of the British Empire Exhibition have faded, its stadium has gone to the dogs, but the success of the First Empire Congress seems likely to be surpassed very greatly by that of the Second Congress, which opened in Montreal this week under the presidency of Sir Robert Horne. It is unanimously agreed that the choice of Canada as the home of the Congress this year was an exceedingly happy one. Canada is still in festive mood, for the celebrations of its Diamond Jubilee have not yet ended, and Canadian hospitality is famous. No country in the world, as Sir Robert Horne said at the opening ceremony, has made such rapid progress as Canada during the last twenty years in the development of mining and metallurgy. Gold, silver, nickel, cobalt, copper, lead, zinc, as well as coal, asbestos and many other minerals are produced in Canada. There are many electrochemical and electrometallurgical processes of a unique character, and there will be variety of interest more than enough to satisfy even the most exacting visitor. Numerous papers will be read, in which the wisdom of the Empire will be focussed on important subjects, and there will be visits, trips and tours of a variety and extent that will try even the most hardy. One cannot but envy those who are able to enjoy such a survey of the industrial and mining achievements and possibilities of the Dominion, and applaud the public-spirited action of Sir Robert Hadfield, who has provided two travelling scholarships to give two more delegates the opportunity of attending the Congress, as we have already recorded. We shall publish a special article about the Congress, and we look forward to its publication, for we know that Canada has a royal way of organising such meetings.

Synthetic Perfumes

In the manufacture of perfumes and perfumed products synthetic materials are being largely used to-day, and the artist perfumer no longer condemns them out of hand. It may be that natural flower extracts are essential to the production of the most subtle and delicate perfumes, but the "synthetics" may be successfully blended with natural perfumes and amongst themselves, whilst in many instances new odour notes may be created with their aid. Thus it is that a large industry has sprung

up for the manufacture of many perfuming materials without which the soap maker and the manufacturer of perfumed toilet requisites would find it difficult to supply the ever increasing demands for their wares. It is not too much to claim that the synthetic perfumes industry, like the synthetic dyestuffs industry, was born in this country, for in the late 'sixties of the nineteenth century Sir W. H. Perkin first made coumarin and noticed its characteristic odour of new-mown hay. As in the case of synthetic dyestuffs, however, it was left largely to others to develop the industry, and the names of Harman, Tiemann, Reimer, Wallach and Bauer come readily to mind in this connexion. It was not until comparatively recent years that manufacturers in this country began to follow the lead of German and French rivals, and although much progress has been made it is probable that we have not caught up in this field so much as in the case of dyestuff and fine chemical manufacture. It is true, to cite a few instances, that we are producing enough coumarin for our own requirements and have an exportable surplus, and that vanillin, ionone, many flavouring and perfuming esters, aldehydes, ketones and alcohols are to be ranked amongst British-made organic chemicals. We believe that the manufacture of artificial musks of the Bauer type is soon to begin in this country, and there can be little doubt that fine chemical manufacturers are able to produce most of the standard synthetics. It is also true that British firms have shown commendable enterprise in developing the manufacture of synthetic thymol and synthetic menthol, which have both fulfilled all expectations even when compared with their natural analogues. At the same time we confess to a feeling of regret that British chemists have not taken a leading part in fundamental research in the domain of synthetic perfuming materials. Synthetic vanillin and ionone were discovered in Germany, the artificial musks were discovered in France, and the German, French, Swiss and Dutch makers have advanced our knowledge of synthetic perfumes by elaborate research programmes. Perhaps the most recent instance is to be found in the determination of the constitution of the true odorous principle of natural musk—which is, of course, not at all akin to the well-known "artificial" musks except in odour—and the consequent production of a true synthetic musk. It is not unfair to compare this synthesis with the famous synthesis of thyroxine by Dr. Harington.

If the British industry of synthetic perfume-making is to develop to a worthy position, much more attention

will have to be given to fundamental scientific research, possibly along the broad lines of determining the relation between odour and chemical constitution. This is a field of study which at present is full of contradictions in spite of the intensive work of the Swiss school under Ruzicka and the American under Bogert, to mention but two outstanding instances the like of which, we fear, is not to be found in this country.

The demand for synthetic perfuming materials is growing, and many British users place large orders abroad. We must not be content to follow in the wake of our foreign rivals, but must strike out for ourselves and, upon the basis of fundamental research, produce new and original synthetics.

A Question of Transmutation

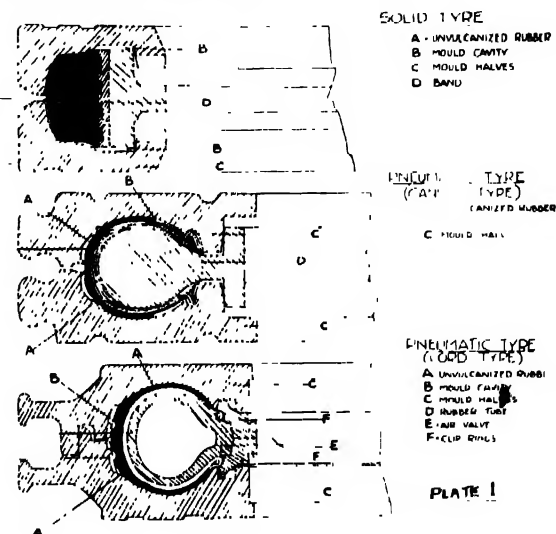

* Recently *The Times*, in an article on the centenary of the death of that amazing visionary, William Blake, remarked that, 'compared to the average Englishman, he corresponds to what chemists call a 'hypothetical radical,' such as ammonium, known and recognised in combination, but never isolated.' It is not the place here to pay tribute to the genius of Blake either as a poet or as an artist, though we are glad to find that it is becoming more usual to drive home a point, even in discussions of literary subjects, by means of a chemical allusion. Further, the quotation has no connexion with our title, unless in an inverse sense, for the alchemist was probably always an isolated worker. This supposition, however, cannot be upheld, as there is an active Alchemical Society in France, complete with a president and other officers, which is still actively pursuing the will o' the wisp of transmutation. M. Jollivet-Castelot, the President of the Société Alchimique de France, indeed, in the pursuit of pure scientific truth, as he calls it, claims to have realised an age-long dream by transmuting silver into gold. The method he has revealed consists in melting, with the aid of the usual fluxes, and at a temperature of 1100°, a mixture of 6 grams of silver, 2 grams of golden sulphide of antimony, and a gram each of orpiment and tin, all chemically pure, with certificates of analysis from a well-known firm. The ingot obtained on cooling is treated with nitric acid, and the insoluble residue is washed with distilled water and ammonia, and then treated with aqua regia. The final filtrate was found to contain 20 milligrams of gold, which, as M. Jollivet-Castelot remarks, is an imposing yield from only 6 grams of silver. The process should, he thinks, be capable of industrial application, though he wilfully puts aside such a base motive from his considerations. We should have mentioned a useful hint of procedure, one which seems to give the true alchemical atmosphere, for, during the heating of the mixture, which required one hour, M. Jollivet-Castelot on two occasions threw small pinches of golden sulphide of antimony into the melt. The author has made his method public, and now, at last, riches are within our grasp. But is the method all? Surely the successful alchemist would have appropriate incantations? And, suppose the silver were of the current alloyed brand, would one obtain metals of the platinum group? Alas, we do not know, and until we do know our happiness has departed.

THE MOULDING AND VULCANISATION OF RUBBER ARTICLES*

By H. WILLSHAW

In dealing with this subject, owing to the fact that moulding and vulcanisation are for all purposes the final operations that are applied to rubber articles, the author has considered it advisable to describe briefly the condition that the unvulcanised article bears before presentation for moulding; and, although the description deals chiefly with tyres, it is hoped that the following examples will give the reader sufficient knowledge to enable him to understand the moulding and vulcanisation of rubber goods in general.

The articles of most importance affecting the rubber industry are pneumatic and solid tyres, tubes, and so forth, all of which call for either steam, hydraulic or air pressure, in conjunction with heavy plant, to effect the requisite final moulding.

Vulcanisation and moulding are produced in one operation, applied pressure and heat being necessary.

Most moulded rubber articles are produced from unvulcanised components, which are shaped and assembled by various previous processes to bear a definite volume relation to the mould in which they are finally shaped and vulcanised.

The foregoing can, perhaps, be more clearly explained by specific examples of three types of tyres, as illustrated on Plate I.

It will be observed that the cord type of pneumatic tyre differs from the description of the two previous tyres inasmuch as the rubber tube has to remain inflated during vulcanisation, such pressure being the means to produce the equalising reaction of the rubber during its expansion. Generally this pressure is round about 200 lb. per sq. in., and the most economical means of introducing and maintaining this pressure inside the rubber tube is by what is known as central or continuous inflation. Briefly explained, it may be said that the air under pressure is carried into the autoclave after the

* Paper read at a Meeting of the Chemical Engineering Group, November 10, 1926.

hydraulic pressure is applied through a central steam pipe with tappings along its length for connexion to the rubber tubes, now located inside the moulds, as shown on Plate II.

Types of pressure vessels

In selecting the most suitable type of pressure vessel for his purpose, the engineer will, of course, be guided by the type of article which has to be vulcanised and by the time taken to effect such vulcanisation.

Where this period of vulcanisation is a lengthy one, there is no doubt that the most suitable type of pressure vessel is that illustrated on Plate II—the autoclave.

Autoclave.—This is a steam vessel designed generally

economically employed. These may be of either the horizontal or vertical type, each type having its particular merits.

Plate III illustrates one of the horizontal type, as now used in the vulcanisation of motor-cycle or light-car tyres. The most important point to note in connexion with this vulcaniser is that the use of hydraulic pressure is completely eliminated.

The vulcaniser consists of upper and lower steam chests wherein are housed the mould halves. The upper steam chest is hinged, thus permitting the tyre—pre-assembled in the manner shown on Plate I—to be placed in the bottom half of the steam chest, which is a fixture.

PLATE 2.

for a working pressure of 100 lb. per sq. in., although actual pressures usually range from 40 to 100 lb. per sq. in., in the interior of which works an hydraulic ram operated by pressure varying from 1600 lb. to 2240 lb. per sq. in.

The diameter of the ram varies according to the total pressure required, and it may be of interest to know that for solid tyre vulcanisation this diameter ranges from 24 in. to 32 in., whilst for pneumatic tyres the range is from 12 in. to 20 in.

The head of the autoclave is designed so that by rotation it can be locked in position to take the thrust of the ram as and when required.

Individual vulcaniser.—Where the period of vulcanisation is shorter, individual vulcanisers can be more

Before moulding, the hinged steam chest is lowered and locked into position by either swing bolts, or, as illustrated, by cam-locking gear. This completed, the connexion for the supply of the air pressure to the rubber tube is made and the air then admitted.

Vulcanising press.—Plate IV illustrates an example of a vulcanising press of the vertical type where hydraulic pressure is again utilised. This type of press is used where the period of vulcanisation is comparatively short, as with cycle tyres.

The two halves of the mould are bolted together against a steam chest, or are themselves chambered for the circulation of steam.

The hydraulic ram on its upward stroke forces the bottom half of the mould upwards and at the same time

expands the solid core segments in order to effect the moulding of the tyre before vulcanisation. The return stroke, of course, reverses these movements and allows the vulcanised tyre to be withdrawn easily.

With this class of article, recent developments have tended to make the operation almost entirely automatic, and the writer believes that before very long the whole operation will be automatic with the exception of merely placing the assembled uncured tyre in the vulcaniser.

Moulding

Since the results produced by the various types of presses described are practically identical, it is considered that a brief description of the conditions existing at the time of moulding in any one of them will be sufficient for the purpose.

Referring to Plate II, it will be followed that with the autoclave head removed, the ram is suitably raised to allow the moulds to be placed one on top of the other, nearly to the full depth of the autoclave casing or steam vessel, following which the head is placed in position and locked.

Low-pressure water (generally around 300 lb. per sq. in.) is used for the ram movements referred to, and the ram is raised by suitable valve operations until the thrust is taken up by the head and then the moulds.

When this has occurred, the high-pressure water is applied by the same valve, in order to give the necessary pressure to close the moulds and to keep them closed against either the expansion of the rubber or the internal pressure in the rubber tubes.

This means that the rubber is displaced gradually to obtain the mould impression.

There is, however, a compacting or additional compression necessary to produce a suitable vulcanised rubber, and this is produced by the rubber itself during vulcanisation.

Vulcanisation

The number of articles vulcanised by open steam pressure is gradually being reduced in favour of curing in some form of mould, as it is realised that a compression of the rubber against the expansion occurring during vulcanisation is necessary to give a vulcanised article of consistent formation.

It is well known that to effect vulcanisation, sulphur (already compounded in the uncured rubber) unites with the rubber on reaching a temperature of about 115° C. Therefore, in order to effect correct vulcanisation of autoclave vulcanised articles steam must be admitted to the vessel after the hydraulic pressure is applied.

In a modern installation the admission and regulation of steam is controlled by means of air-operated diaphragm valves and thermostats, referred to later on.

The effect of heat on the unvulcanised rubber causes it to expand with considerable effect, the expansion being determined to some extent by the rubber content of the compound used.

As for all practical purposes the unvulcanised rubber

when heated up is incompressible, it becomes easier to understand the condition that prevails in the autoclave at the commencement of vulcanisation, when the rubber, displaced by the effect of the ram, is expanded

by the heat from the steam admitted, in an endeavour to open the mould and release any excess.

It has previously been stated that the potential expansion is proportional to the rubber content of the compound used, and it will be followed that, before any release of rubber can occur, a compression of everything inside the moulds takes place, equal to the total load upon the ram, thereby resulting in compacting the rubber against the mould, producing an exact impression of the mould.

Why pressure is necessary

As is generally known, unvulcanised rubber contains, to a varying extent, very small air cells, and is sometimes, to the naked eye, porous, whilst if vulcanised without pressure it becomes very porous.

To obtain complete consolidation, correct pressure is necessary in order to disperse this porosity throughout the entire rubber mass, and so give an uniform condition together with the requisite physical properties.

In addition, for the rubber article to bear correctly all the markings of the mould, a proper determination of hydraulic and, where required, air pressure is necessary, to equalise the pressure set up within the moulds due to the rubber itself during vulcanisation.

It is always a check on whether the article has had the correct pressure to note the surplus of rubber that is expelled during the vulcanisation, which is referred to as "spew." This should be as thin as possible, as it will be realised that if the moulds are open the "spew" will be much thicker than is desired, and the shape of the article will be affected.

Control of temperature during vulcanisation

It has been previously mentioned that the admission and regulation of steam is controlled by means of thermostats and air-operated diaphragm valves.

One of the greatest problems in connexion with the vulcanising of all rubber goods is that of producing uniform temperatures throughout the curing vessel, and in all installations a considerable amount of study and experimentation is made in order to produce, by suitable arrangement of the controlling thermostat and the condensate regulators, correct circulation.

Perhaps it would be as well for a moment to dwell on the condition that occurs in a vertical vulcanising vessel where the above arrangement has not been carried out correctly, in which case the controlling valve simply admits steam to the vessel, displacing and driving to the bottom of the vessel the air that was previously in the vulcaniser before the admission of the steam. If the air is allowed to remain undisturbed, a very noticeable effect on vulcanisation will occur, as those articles that are in the lower zone will not be vulcanised as well as those that are in the steam under more or less better conditions.

An ideal vulcanising condition is where there is a definite circulation of steam or heat, but, owing to the high cost of steam, it is necessary to arrange for the ideal conditions of minimum steam consumption and uniform temperatures to be obtained.

The importance of time control

Where the vulcanising time is short, as with cycle tyres, or, further, a light-car tyre, to obtain correct vulcanisa-

tion it is necessary to ensure that the correct time of the tyre in the moulds is observed. This has brought about the development by one large company of a number of timing devices. Plate No. V illustrates one such device in which a screw-operated shaft, driven at a definite speed, drives by suitable gears a battery of screwed vertical shafts. Encircling each of these shafts at equal spaces are a number of vertical spindles, attached to each of which are two arms, which in turn support a square bar on which is attached a segmental nut, free to

slide and capable of being set at any desired point on the bar.

To the bottom of each spindle is attached a metal plate, separated from a pair of magnetic coils by a small gap, whilst at the top is a smaller plate, insulated from the spindle, which operates the light switch as afterwards described.

Briefly, the action of this device is as follows:—The segmental nuts are set at the desired position according to the length of cure required. The closing of the vulcaniser completes an electric circuit which energises the coils and magnetic attraction causes the metal plate to move towards the coils. As this takes place the vertical spindle is turned, thus bringing the segmental nut into mesh with the vertical shaft. This causes the nut to travel upwards, and at the same time prevents

the metal plate from coming into actual contact with the coils. When the nut reaches the top of the shaft, which is recessed, the plate is pulled home against the coils. This further rotation of the spindle brings the nut into the recess and the top plate completes a separate electric circuit and lights a coloured lamp over the particular press in operation.

The opening of the press breaks the coil circuit, and under the influence of a spring the vertical spindle returns

to its original position, and the nut is thereby withdrawn from the recess and falls on to its stop. At the same time the top plate is moved away from its contact, thus breaking the lamp circuit.

By such means the operators on the vulcanisers are advised of the progress of events; but to keep check on the personal element, which cannot entirely be eliminated, an additional device is incorporated in the above-described timing gear whereby any particular vulcaniser can be checked by plugging into the particular circuit, thereby connecting it to a recording mechanism and producing a graphic record on a chart of the actual time of vulcanisation.

A further development in this direction consists in placing in the circuit a suitable mechanism, which in the case of the cycle press results in the hydraulic pressure being released at the exact time determined by the period of vulcanisation, thereby automatically lowering the press and leaving the tyre in such a way as to be readily removed.

Effect of temperature throughout cure

During the period of vulcanisation of tyres, the heat penetrates from outside to inside, so that the temperatures of the inner portions of the tyre lag behind those of the outer ones to a fairly considerable extent.

Plate VI illustrates a typical example of this temperature lag, and it will be followed from this how essential it is that the arrangement of the various component parts is such as to give uniform vulcanisation of the moulded article.

(To be continued)

WEIGHING IN THE CHEMICAL INDUSTRIES

By W. A. BENTON

(Concluded)

All self-indicating balances actually in use to-day depend for their operation on the yielding of a variable resistant in proportion to the load. Springs of various kinds have been used both in cheap and in very costly devices.

For certain special purposes where strictly maintained accuracy is not essential I should not hesitate to use a spring to-day; but in, I suppose, nine-tenths of the better-class technical and industrial instruments used throughout the world the variable resistant is not a spring, but a pendulum or bent lever. This resistant has been proved to be more reliable and more constant than the spring when used under the changing atmospheric and thermal conditions prevailing in industrial laboratories and factories.

The extension of a spring of the very best class under a given load varies with change of temperature. Such change produces two different effects, both of which are inimical to the accuracy of weighments. Firstly, the length of the spring is altered, causing a variation in the zero or no-load indication. Secondly, the specific elasticity of the steel is altered, causing an increasing variation in the indications from zero to maximum capacity.

It is possible to compensate perfectly the former of these variations, which, in the case of a symmetrical spiral spring can be shown mathematically to be always

FIG. 10

The cam-operated pendulum resistant

The rate of change of the arm-lengths corresponds very closely with the rate of change of the pendulum moment-arms.

small, owing to the configuration of the elastic material in the form of an open spiral. The latter aberration is not so easily compensated, and has not been entirely obliterated on any commercial instrument with which I am acquainted. It would, however, be possible by several known devices to effect a rectification within any assignable limits. A much more serious objection

to spring resistants is the lag or hysteresis of the material—steel—of which the spring is made. Load a spring for a time with a heavy load, and then carefully remove the weight, or let the return of the spring and pointer be steadied by means of a dash-pot, as is necessary in all good commercial instruments, and it will often be found that the pointer will not exactly return to zero, or will not do so until after a certain time, or until the instrument has been subjected to some shock or vibration.

Now, while it would be quite possible to exaggerate the evil of this slight hysteresis in industrial weighing instruments, the defect is undoubtedly a very real one, and has resulted in the abandonment of the spring as a weighing resistant in high-class industrial instruments by nearly all the leading makers in Europe and America. The spiral spring has, however, one great advantage which no other known resistant shares in an equal degree: it conforms almost absolutely to Hooke's Law,

FIG. 11

Double-pendulum visible weigher

and gives equal chart divisions for equal increments of load.

This is not the case with the pendulum resistant, and in the weighing machines illustrated two devices are used to obtain the great practical advantages which result from equality of sub-divisions. The first method, exemplified in the semi-automatic platform machine,

is to reduce the angular movement until the arcs and sines (perpendiculars) of the angles are of practically the same length. This method always renders the instrument susceptible to slight changes of level. By using two pendulums rotating in opposite senses the tendency is overcome. Some of the machines illustrated embody opposed pendulums which serve this purpose.

The second method of obtaining equal graduations is by connecting the main weighing lever to the resistant

FIG. 12

Visible weigher platform machine

The deposition of the load moves a pointer which shows the "notch" on the steelyard in which the pole should be placed. As soon as this is done, the machine indicates in *cists.*, *grs.*, and *lb.*, to the nearest half-pound, the weight of the goods.

by means of a strap passing round a circular cam affixed eccentrically to the knife-edge axis of the pendulum. The diagram (Fig. 10) shows that this displacement effects a correction which almost completely compensates for the so-called circular aberration of the resistant.

Various mechanisms suitable for industrial use embodying these devices are shown in Figs. 11 and 12.

The advantage of a tare-bar and of tare-indicating devices will be readily understood by those engaged in industries in which receptacles have to be filled with a nett weight of a commodity or chemical substance. Very convenient and rapid weighers are available for practically all technical operations in which weighing is involved.

"Difference weighers" are particularly useful, as they permit the exact divergence of a load from a pre-determined weight to be automatically indicated in excess or deficiency.

Perhaps it may here be profitably pointed out that the advantages of self-indicating weighers—in which the handling of weights is either dispensed with or reduced to a minimum—are by no means limited to the increased speed of operation, or the saving of labour and its resulting fatigue. Careful study of the mistakes made by skilled and unskilled weighmen engaged in technical weighing on loose-weight and steel-yard machines shows that while the latter—the unskilled—make mistakes of all kinds, the former generally correctly balance the varying loads, but more or less often make mistakes in reading the weights, or the steel-yard indications, or both. That is a very important point, and one to which as a result of personal investigation, I have often called the attention of factory and laboratory superintendents.

In the case of self-indicating machines, it is very seldom that a weighman reads or records the dial readings incorrectly, and in the case of printing machines the human element is practically eliminated.

FIG. 13
A modern automatic feed-weigher

I invite anyone interested in the accuracy of industrial weighing oftentimes a question of immense financial or technical importance—to investigate for himself the conclusions just indicated. It will also be found that when weighing has for any reason to be hurried, and pressure is put upon an operator to hasten his task, the number of mistakes made is always much greater with the old-fashioned instruments than with the new.

One other remark before leaving this aspect of my subject: accurate and frequent weighing throughout any series of technical processes embodied in a chemical or metallurgical industry almost always results in the discovery and subsequent elimination of unsuspected sources of waste, and sometimes in the discovery of very surprising leakages. It would not be difficult to give instances of this, but lack of time compels me to pass on to another and quite different type of automatic weigher. I refer to the huge class of automatic and semi-automatic feed weighers.

If a substance can be induced to flow through a conduit, or fall down a chute, it can be automatically weighed. Thus, all liquids, except such very corrosive ones as present special problems in respect of the few substances available to resist their action, can be automatically weighed. So can all powders, granular and lumpy materials, all grains, berries, seeds, crystals, and most fuels, from coke-breeze to best lump coal.

The principles and devices embodied in most of the machines are very similar. In almost all the best machines equal-armed beams are used. The unbalanced pressure of the weights when the machine is empty causes the receptacle end of the beam to rise and open the valve or jaws admitting the substance to the weighing hopper. As the load approaches a balance the weight of the jaws, or the weight of a counterpoise on the beam in this position, causes the receptacle to fall and so cut off the main supply by closing the main feed valve. A small feed valve, however, remains open, constituting the "dribble" feed, and this is not closed until the loaded receptacle moves to the balanced position and permits the appropriate mechanism to close this little valve. At this stage in the cycle of operations, by raising a small lever called the compensating lever, and throwing it over, it is possible rapidly to test the accuracy of the weighing by noting whether the beam is properly balanced.

Left to itself the counterpoise will cause the receptacle to fall and release a detent which opens the emptying valve of the receptacle, or alternatively causes the receptacle to be overturned. When empty the receptacle resumes its former state or position, and the cycle automatically commences again. (Fig. 13.)

It is possible, and quite usual, to employ batteries of automatic or semi-automatic feed-weighers to supply the different constituents of a mixture, liquid or solid, or both, and to maintain quite accurately the relative proportions of the parts.

As to the accuracy of such weighments—modern machines give quite astonishing results, especially in the case of granular materials. An error of one-fifth of 1% should not be exceeded, and on a large number of weighments the total error, when it can be ascertained, will generally be found to be less than half the above. Even coal for boilers can be weighed if the conditions are reasonably good to within half of 1%. Remarkable results in checking boiler economies are now possible by combining closed water-weighers with coal weighers, so that for each boiler the coal consumption and accompanying water consumption can be ascertained either continuously or over any given period. Moreover, the machines can be made to record the coal and water consumptions on charts or on one and the same chart.

I feel very sure that eventually this will become a standard method of checking boiler-plant economies. It is direct. Its records need no interpretation. They give just what the engineer and the financial authority want to know, namely, water evaporated per pound of coal.

Too often the real facts—the vital facts—are hidden under a cloud of CO_2 readings, thermometer readings and the like, and what actually is happening with any particular boiler during ordinary use—as distinguished

from what happens on the occasion of a full-dress test—is entirely lost sight of.

The CO_2 recorder is a useful and indeed almost indispensable instrument in the hands of a skilled power-station engineer with a sound knowledge of the chemistry of combustion, but the blind faith shown by many engineers in the supposed inevitable relationship of high CO_2 readings with high boiler-plant economy is one of the strangest phenomena of recent years, and not very creditable to the engineering profession. A little knowledge of chemistry would have prevented some of

FIG. 14

The new Avery automatic steam condition-testing plant, for spinners, combers, and manufacturers

the more glaring absurdities that came under one's notice when engaged in general engineering practice. A very well-known consulting engineer told me some months ago that in a survey of a large number of plants he had been unable to find any understandable relationship between the CO_2 records and real boiler economies. Perhaps matters have somewhat improved during the last two or three years, but, personally, when I was engaged in that sort of work I never found a stoker so dull as not to be able to give his employer as high a CO_2 reading as the heart of man could desire—or his employer afford to pay for.

This is a digression, but not, I hope, quite out of place. Weighing is the real test, and sooner or later will come into its own, as is instanced by the equipment of recently-built stations.

A word is needed about an instrument called a *weighing totaliser*, now much used for weighing loaded trucks, or a succession of loads varying in individual amount. The weighments are made automatically and recorded, one weighment being added to another so that at any moment the total load passed over the machine can be known. This instrument in various applications is now much used in industrial concerns.

Another instrument of considerable technical importance is the *automatic steam-heated condition-testing plant*. This instrument (Fig. 14) is used chiefly in the woollen, cotton, silk, and artificial silk industries, but is also used by paint manufacturers and others. It enables the "condition" of "tops," yarn or the like to be rapidly ascertained. The material is weighed, and then hung from a self-indicating quadrant balance in a pre-heated steam-jacketed testing oven raised to a temperature of 240° Fahr. corresponding in the case of this particular instrument to a steam pressure of 35 lb. per square inch. The entire operation may occupy from 40 to 60 min., but may be reduced to about 30 by the use of an auxiliary oven. The amount of moisture extracted is automatically indicated by the pointer of the balance moving over a divided dial. The instrument is perfectly safe and very reliable. The steam chamber is hydraulically tested up to 160 lb. per square inch before being sent from the works.

This very brief and inadequate sketch of weighing instruments suitable for use in chemical industries must now close. It has only been possible to give a bare outline of the subject. Most industrial weighing propositions can now be dealt with by standard instruments, and, where this is not the case, a suitable device can almost always be designed—whether it be for automatically weighing molasses or weighing dynamite.

CANADIAN INDUSTRIAL NOTES

The net profits of the Royalite Oil Co., Calgary, Alta., amounted to \$535,496 for the year 1926. The revenue from the well for gas was \$307,776, and from naphtha \$898,361. Royalite well No. 4 produced 205,421 barrels of naphtha during 1926.

The Price Development and Refining Co. will commence the construction, at Wainwright, Alta., of a 10,000 barrels a day oil refinery. The first unit, for 1000 barrels, will be operating before September next.

It is reported that Anglo-Persian interests will take over British Petroleums, Ltd., the pioneer producers in the Wainwright field, Alta.

The Royal Crown Soaps, Ltd., of Vancouver, B.C., will add a new factory to its present establishment.

Another distillery will be erected at Sarnia, Ont., by the recently chartered Sarnia Wine and Cognac Co. Wines and brandies will be manufactured. Expert distillers are to be brought from the Rhineland district of Germany.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICE

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, will be available at the end of this month. The reprints will be in JOURNAL format, with paper cover, and the price will be 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent at once to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

CHEMICAL SOCIETY'S LIBRARY

The Library of the Chemical Society will close each evening at 5 o'clock from August 15 to September 10.

CALENDAR OF FORTHCOMING EVENTS

- Aug. 31 BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. Annual Meeting (97th year) at Leeds. (*See CHEM. AND IND., August 19, p. 747.*)
- Sept. 2 COKE OVENS MANAGERS' ASSOCIATION. Continental Tour. (*See CHEM. AND IND., August 19, p. 749.*)
- Sept. 6 INSTITUTE OF METALS. Autumn Meeting to be held at Derby. (*See CHEM. AND IND., August 19, p. 748.*)
- Sept. 9. INSTITUTE OF BREWING. Research Fund Committee and Corporate Members. Visit to hop-growing districts in Kent.
- Sept. 12 to 14. INTERNATIONAL SOCIETY OF LEATHER TRADERS' CHEMISTS. Bi-Annual Conference in London. On Sept. 12, at 10 a.m., at the Leathersellers' Hall, St. Helen's Place, E.C.3, reception of members by Prof. D. McCandlish (president), supported by the Master of the Leathersellers' Company (H. C. Dove), and the presidents of the Society of Chemical Industry, Chemical Society, Institute of Chemistry, Society of Dyers and Colourists, British Association of Chemists, and the Royal Microscopical Society. At 1 p.m., Luncheon will take place at the Connaught Rooms, Great Queen Street, W.C., by invitation of the United Tanners' Federation and the Federation of Curriers, Light Leather Tanners and Dressers. At 3 p.m. a discussion will be held of Technical Agenda. On Sept. 13, at 10 a.m., the discussion will continue, also at 2.30 p.m., and at 7 p.m., Dinner will be held at the Hotel Cecil, Strand, W.C., by invitation of the Members of the British Section of the International Society of Leather Trades' Chemists. Sept. 14, at 10 a.m., the discussion of Technical Agenda will continue, and also at 2.30 p.m. The Chemical Industry Club, 2, Whitehall Court, S.W.1, has kindly granted facilities for members attending the Conference to have the use of the Club during the period of the Conference.
- Sept. 13. SOCIETY OF CHEMICAL INDUSTRY. Official Visit to the Shipping, Engineering and Machinery Exhibition at Olympia, London, W.
- Sept. 14. INSTITUTION OF SANITARY ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.
- Oct. 7. SOCIETY OF CHEMICAL INDUSTRY. Manchester Section. Chairman's Address, by C. J. T. Cronshaw.

CORRESPONDENCE

THE COLLEGE MAN AND CHEMICAL INDUSTRY

SIR, - I have read with much interest the letter in your issue of August 12, signed "William Cullen," relating to the usefulness of the college-trained chemist in industry.

There is no doubt that many university men have been unsuccessful under the conditions prevailing in factories. The reason is generally summarised under the comprehensive title, "Lack of experience." Two main causes contribute to the failure of most chemists: (1) faulty training, (2) lack of personal direction.

The present university system was founded as an educational measure pure and simple, and numerous traditions have been handed down from generations of professors to their assistants. The general methods of teaching have improved, but only as a separate and individual item. There is no meeting place between industry and education as far as the chemist is concerned. The chemical teacher has, generally speaking, no practical knowledge of technical processes, and he is therefore incapable of dealing with industrial problems or imparting knowledge thereon. This is greatly to be deplored, as industrial processes are based on ordinary chemical principles, and are quite as interesting and educational as the highly academic problems which are most frequently discussed in the university centres. The knowledge which the student gains is generally without practical importance, and the young man's judgment of values is consequently faulty.

The British system of university education provides largely for the professional man. The system and spirit of research which dominate the German universities are not so highly developed in this country. The young trained chemist therefore has no self-reliance as compensation for his faulty education. It is grossly unfair to expect a young man of this type to do anything of practical value in a works without further assistance. The young graduate needs above all the guiding hand of experience, which he is only too frequently unable to obtain. The best position for a young chemist is as assistant to an older and more experienced man, but this, of course, is not always possible.

Many firms are of the opinion that the employment of a chemist will solve all their problems, and such firms are generally those which can offer the least assistance to the inexperienced man. Failure is inevitable under such conditions, and it very rarely happens that a young chemist is able to obtain the direction which he needs. Most firms do not know how to utilise the trained knowledge which the chemist has stored in his brain. The solution is difficult. Some universities have technical branches where the principles of various industries are well taught, and there is a general desire to utilise the instruction given in these departments as a portion of the educational system. This is excellent where specialisation is desired, but practically nothing is done for industry as a whole in the chemical department itself.

Every trained chemist needs some tuition in factory methods, and this he can acquire only from practical men. Every university should have one lecturer who has had at least five years' practical works' experience. Each

student should be compelled to make one chemical product on an economic basis, and such experiments should be run successfully for at least a month.

The spirit of the workshop should be grafted on to the highly academic and educational system of our universities.

A discussion on this subject before one of the learned societies would undoubtedly lead to interesting and profitable results.

Yours faithfully,

H. DRAKE LAW

PERSONAL AND OTHER ITEMS

Lieut.-Colonel L. F. Goodwin, commanding the Princess of Wales' Own Regiment (Professor of Chemical Engineering at Queen's University, Ontario), had the honour of receiving their Royal Highnesses, the Prince of Wales and Prince George, on their recent visit to Kingston at the beginning of August, when the Prince of Wales consented to visit the officers of the Regiment, of which he is Colonel-in-Chief.

Sir Oliver and Lady Lodge celebrated their golden wedding this week.

Mr. H. Talbot, M.I. Chem.E., B.Sc., A.R.C.Sc., General Manager of the Welsbach Light Co., Ltd., and until recently Hon. Secretary of the Chemical Engineering Group of the Society of Chemical Industry and a joint Hon. Secretary of the Fuel Section of the Society, has been appointed a delegate of the Society of British Gas Industries to the forthcoming Industrial Commission on Illumination, which will begin in Bellagio on August 31.

Prof. P. Baldi has been appointed to the chair of general and analytical chemistry at the Turin Technical Institute.

Dr. H. Stadlinger, a director of the Scheidemandel A.-G., and head of that firm's technical research laboratories, has replaced the late Herr Blucher on the editorial staff of the *Chemiker-Zeitung*.

The death is announced of Prof. Pulfrich, director of the section for scientific measuring instruments of the Zeiss optical firm, and the originator of the refractometer which bears his name.

The late Mr. F. Lloyd, chairman and governing director of Edward Lloyd, Ltd., papermakers, left £679,923, with net personalty £618,051.

Fastness of Dyestuffs to Light

The British Research Association for the Woollen and Worsted Industries, in a communication to the Journal of the Society of Dyers and Colourists, gives an account of the research work organised by its colour laboratories in relation to the fastness to light of dyestuffs on woollen and worsted fabrics, with the co-operation of leading scientists in all parts of the world. The results may be summarised as follows:—The experiments performed on fading of dyestuffs in the tropics, in town and country in England, and by artificial means, show that the present system of artificial fading does not agree in results with those given by sunlight, and that there was actually less

fading in the tropics than at country stations in England. The discrepancy was largely due to humidity conditions in the atmosphere around the patterns. As the colour loss increases with increase of humidity, a standard humidity must be prescribed for all fading tests. Under standard conditions, the loss of colour has a direct relationship, but is not directly proportional, to time of exposure. Therefore, sufficient time should be given to the exposure to allow the fading to be in excess of the initial, more rapid, fading action. An explanation is suggested for the statement that deeper shades are faster than pale shades. An increase in the ultra-violet radiation produces an increase of fading, the effect being intensified by increase of humidity. The general conclusion points to the necessity for observing standard conditions of light-intensity, temperature and humidity at the surface of the pattern during the test exposure. A new type of fading cabinet and a new colorimeter are described in the communication, which also mentions a new fading lamp, to be described later.

Sugar Beet Prices

As a result of negotiations with the representatives of the existing beet sugar factories, the Sugar Beet Committee of the National Farmers' Union has decided to recommend the following terms with regard to the price to be paid under a three years' contract for beets delivered during the next subsidy period (1928—30):—A fixed guaranteed price of 46s. per ton for beets of 15½% sugar content, plus an addition at the rate of 3s. for the first 1% above 15½%, and at the rate of 3s. 4d. for each additional 1%, the reduction in respect of beets below 15½% to be at the rate of 3s. for each 1%.

Platinum in Canada

Seven ounces of platinum have been won from placer gravels in Coalmont and the Upper Tulameen Valley in British Columbia. During the past year or two there has been considerable prospecting along the Tulameen valley for platinum and gold, but the annual report of the British Columbia Minister of Mines indicates that the results of placer-mining on the Tulameen have been disappointing as far as actual production of platinum and gold are concerned. Federal Government statistics indicate that in 1926 production in British Columbia of platinum totalled 50 fine ounces, as compared with 6 ounces in the previous year. Besides platinum, small quantities of related metals such as iridium, osmium, ruthenium and rhodium have been found in concentrates shipped from British Columbia to England for refining.

The New Ontario Oil Field

Ten producing wells have now been completed in the new Camden township oil field, in Kent County, Ontario, where the Vacuum Gas and Oil Co., Ltd., has been drilling for the past few months. The Ajax Oil and Gas Company has recently acquired new leases along the northerly extension of the field, and has let a drilling contract. The first well will offset the No. 1 Vacuum, which gave such large initial production, and is still one of the best wells in the field, being rivalled only by the No. 1 Eagle Well, stated to be producing over 30 barrels a day.

Asbestos in Cyprus

Speaking at the annual general meeting of the Cyprus Asbestos Co., Ltd., the managing director, Mr. F. C. Jenkins, said that the output of asbestos, already double that of last year, was expected to reach 12,000 tons a week before the end of the season.

The Sugar Trade of India during 1925-26

The output of sugar by modern factories and refineries in India in the year 1924-25, fell from the record figure of 94,800 tons in 1923-24 to 66,300 tons, a decrease due to the curtailed production of sugar both from cane and from refining gur. Factories making sugar direct from cane produced 33,745 tons as against 38,312 tons in 1923-24. Taking India's production of refined sugar by the indigenous process roughly at 50,000 tons, a total production of 116,300 tons of refined sugar is calculated for the year 1925-26 as against 144,800 tons in the previous year. India's imports of foreign sugar during the same period were the largest recorded since 1921-22, totalling 732,600 tons against 671,000 in 1924-25 and 717,600 tons in 1921-22, the record figures being 803,000 tons in 1913-14. Exports by sea in 1925-26 of palm and cane jaggery, including molasses, fell from 20,000 tons, valued at Rs. 47 lakhs, to 1900 tons, valued at Rs. 5 lakhs. Of this, the United Kingdom took the small amount of 19 tons, as compared with 17,600 tons in 1924-25. Exports of refined sugar for the same year amounted to 600 tons, valued at Rs. 2,18,625, against 1058 tons, valued at Rs. 1,55,357, exported in the previous year, the decrease being due to Ceylon taking only half the amount of sugar she required in 1924-25.

World Consumption of Fixed Nitrogen

In the fertilizer year 1926-27 (ending on June 30), the world consumption of nitrogenous fertilizers, expressed in terms of pure nitrogen, was 1,315,000 tons, compared with 1,206,000 tons in 1925-26, and 1,088,000 tons in 1924-25. The share of the Chilean nitrate industry was 271,000 tons compared with 323,000 tons in 1925-26, whereas the consumption of synthetic nitrogen compounds was 734,000 tons, as against 583,000 tons in 1925-26 and 450,000 tons in 1924-25. It would seem that if the output continues to rise to the same degree, there will be danger of a glut of nitrogen compounds, unless new markets are opened out. Most relief would be possible if the demand from India and China was encouraged. In fact, speaking before the Royal Commission on Agriculture in India, Mr. Speyer, the general manager of Nutram, Ltd., states that Imperial Chemical Industries, Ltd., would consider the erection of a plant in India to manufacture synthetic nitrogenous fertilizers. Close attention to the potentialities of the Eastern markets is being paid by other countries, particularly the United States.

World Production of Celluloid

According to the U.S. Trade Commissioner at Berlin, the world production of celluloid is estimated at 40,000 tons a year of which between 10,000 and 15,000 tons is produced in Germany. About half the German production is due to one company in Frankfurt.

Cellulose Acetate in the U.S.A.

The Celanese Corporation of America is planning the construction of an addition, to cost 2½ million dollars,

to its Amcelle, Md., plant, to produce cellulose acetate for use by the Celluloid Company, which the Celanese Corporation recently took over.

American Institute of Chemistry

The first annual session of the Institute of Chemistry, promoted by the American Chemical Society, has now concluded, after four weeks' work. Altogether 360 chemists, including a number from abroad, were present.

A New Photographic Developer

A paper by E. Gebauer-Fulnegg and E. E. Fleck (*B. J. Phot.*, August 19, 1927) suggests the use of amino-resorcinol (1:3-dihydroxy-4-aminobenzene) as a photographic developer. The hydrochloride of amino-resorcinol is very soluble in water, and is a developer of high energy, which does not produce fog even in the absence of bromide.

Para-cymene in the Paint Industry

Para-cymene, a by-product of the sulphite pulp industry, is formed during the digestion of spruce woods by the sulphite liquor, and is blown off, together with other volatile products, with the relief steam from the digesters. Recent work (*Chem. & Met. Eng.*, 34, 5, 1927) has shown that para-cymene is a satisfactory thinner for paints, varnish and lacquers, and as some 1,300,000 gals. could probably be recovered in the United States alone, it is suggested that recovery should be worth while, especially as the operation would be comparatively simple.

Amyl Alcohols from Gasoline

An interesting account has been published (*Chem. & Met. Eng.*, 34, 5, 1927) of the process by which the Sharples Solvents Corporation produces amyl alcohol from casinghead gasoline. The gasoline is fractionated to give a "cut" which is practically a pure mixture of normal and iso-pentane. This is chlorinated at 100° C. under pressure in a reaction unit, amyl chloride and hydrogen chloride being formed. The hydrogen chloride passes through a condensing system to a fused silica absorption plant developed by the Thermal Syndicate, Ltd., and the mixture of condensed amyl chloride and pentane is distilled, the pentane being returned to the system. The amyl chloride is purified by distillation, mixed with soda lye and hydrolysed in columns containing a catalyst, the alcohols thus produced being redistilled and fractionated to yield a mixture of amyl alcohol with its isomers. A certain amount of the product is converted into amyl acetate by acetylation with acetic acid, using sulphuric acid as the catalyst. Close attention to the various fractionations is necessary to ensure a product of high purity and uniform character.

Removing Rust from Piping

A method is described (*Chem. & Met. Eng.*, July, 1927) of removing rust from a system of piping by means of a strong, hot solution of hydrochloric acid (prepared by mixing commercial acid with hot water) which had been rendered inert to the metal by the use of an inhibitor. The action was limited to the dissolution of the rust, and the metal piping was not appreciably attacked. The inhibitor used was of a type originally used in pickling metals, and in view of the many organic substances

which have inhibitory properties, even when used in very small quantities, a wide field is open for choice. A later paper will show that inhibitors have a strong electrochemical effect in raising the hydrogen over-voltage, and they may be considered to act by forming over the bare cathodic metal a film which prevents the ready evolution of hydrogen.

Changes in U.S. Patent Law

A recent amendment to the United States Patent Law provides that notice must be given to the public that an article is patented either by fixing the word "Patent" and the number of the patent on the article, or, if this cannot be done, by fixing the like notice on the package. Articles patented prior to April 1, 1927, however, merely require the addition of "Patented," together with the date of the patent; in suits for infringement, proof of continuance of the infringement after notice of infringement was served will be required. The rates of patent fees have been established as follows:—Applications, \$20; issue of patent, \$20; reissue, \$30; filing a disclaimer, \$10; appeal from primary examiners, \$10; appeal from examiners in chief, \$20.

Commercial Testing and College Research Laboratories in the U.S.A.

The U.S. Bureau of Standards is too occupied with official work for it to make tests for private individuals if other laboratories can do the work, and it has accordingly prepared a "Directory of Commercial Testing and College Research Laboratories," which lists 207 commercial testing laboratories throughout the country, together with indications of the types of commodities they are prepared to test, in addition to a list of 143 college laboratories which are used for research work as well as instruction. The Directory gives an outline of a certification plan, in accordance with which there have been compiled 48 lists of manufacturers who are ready to certify to purchasers that material supplied on orders based on 48 U.S. Government master specifications complies with the requirements of these specifications. In this connexion the Bureau publishes a Directory of Specifications for over 6000 commodities, and points out the economy to be realised by their use. These publications are found to be of considerable utility to industry in the United States, and the provision of similar directories in this country deserves serious consideration, particularly in view of the increasing demand for standardisation.

New Spirit-Soluble Colours

It is announced that E. I. du Pont de Nemours & Co. has placed on the market a new series of spirit-soluble colours, the "Luxol" colours, which are soluble in methyl and ethyl alcohols, pyridine, furfural and diacetone alcohol; some are soluble in acetone. The production is made possible of a wide range of transparent coloured pyroxylin lacquers of exceptional fastness to light.

The I.-G. Farbenindustrie

We recently recorded the intention of the I.-G. to utilise aerial transport. The object of that decision now becomes clear, as the Höchst-am-Main branch of the I.-G. has dispatched, on the request of the Persian Government, 100,000 tubes of anti-cholera serum to Teheran by aeroplane, by way of Moscow.

The Times reports that two employees of the Höchst-am-Main branch of the I.-G. are alleged by the police to have stolen the "formulae" of certain proprietary articles made by the I.-G., including "pyramidon," for sale to a British firm. Pyramidon is a well-known antipyretic, dimethylamidoantipyrine, first patented in 1896 and 1897.

Reports of varying nature still continue to appear regarding the agreement between the I.-G. and the Standard Oil Co. of New Jersey. As far as anything definite can be deduced it would appear that the Standard Oil Co. is to utilise the I.-G.'s new method of refining "the products of coal distillation," which is said to be better and cheaper than the cracking process. The I.-G. has been working at its synthetic motor fuel process for some time, but none has appeared on the market, and some trials with it on a racing car are said to have proved disappointing. It is said that no agreement was made regarding the world rights of the new process, and negotiations concerning various European rights for the process if it proves successful—may be expected. The discussions are said to have related also to the manufacture of synthetic ammonia, glycol, and other products.

Recent statistics indicate that out of 12,392 stock companies in Germany, with an aggregate capital of 20,354 billion marks, the chemical industry comprises 620 companies, with a capital of 1853 billion marks, 81 of these companies being included in the I.-G., which represents 62% of the total capital. Of the chemical companies, 118, representing 82.7% of the total capital, are members of the "concerns," which are based on joint capital, arrangements for community of interests, and so on.

A new plant has been built at Wolfen to work up the copper pyrites residues from the works, which were formerly sold to the Mansfield A.-G.

Chromium Plating in Germany

At the end of 1925, chromium plating was employed in but two works in Germany, but during 1926, 23 new works were opened, most of which employed the "chromo-industrie" process, the remainder using the Liebreich process. Plating with chromium has been adopted on a large scale at Solingen for the production of cutlery, and the use of chromium-plated parts is spreading. The "chromo-industrie" process is said not to require technical handling, whilst it works with a very small current density, gives rise to but little free hydrogen, and forms a uniform, strong and finely-ground deposit.

New Use for Aluminium

The German Research Institute for Aluminium has found that containers made from aluminium that has been treated by a special process can be used to replace tinned containers for fruit, vegetables, oil, and so on. Aluminium prepared in this way is stated to be already in use by German food manufacturers.

Intellectual Property in France

By a ministerial decree dated May 12, and published on July 18 19, a committee of three legal experts has been appointed to examine legal questions concerning the rights and interests of writers, artists, and scientists

and of their works, and to prepare bills, decrees, and regulations relating to those questions. The committee has power to call upon expert advice.

Activated Charcoal

At an extraordinary meeting of the Société des Charbons Actifs Edouard Urbain in Paris on August 5, it was decided to increase the capital from 4 to 54 million francs by the issue of 184,000 A shares of 250 francs each, and of 40,000 plural-vote B shares of 100 francs each, the latter to be taken up by the Urbain Corporation of America. The concern has changed its name to "Charbons Actifs et Procédés Edouard Urbain, S.-A.," and will extend its work to the manufacture of all types of chemical products. The directors' report states that the Urbain Corporation will work the American market, whilst the French company will have the whole of the European market (except England), and will be entitled to use, by licence, all the patents and products of the American concern. The French company, which, in addition to activated charcoal, produces hydrogen and oxides of carbon, will extend its activities into the domain of organic high-pressure syntheses. To this end, it will co-operate with a friendly industrial group in the formation of the "Société Immobilière et Industrielle de Berre," which has already acquired an excellent site at Berre.

Petroleum in France

The French Ministry of Commerce announces that since the "Office National des Combustibles Liquides" began boring at Hérault, 9000 metric tons of petroleum have been extracted.

Chemical Industry in Spain

Active development is proceeding in Spanish chemical industry. The Industrial Resinera Ruth concern, of Bilbao, has obtained fiscal and other concessions in view of the manufacture of synthetic camphor, and has raised its capital to 2 million pesetas. A new oxygen factory has been established at Madrid; paint and varnish are to be made at Barcelona by the Pablo Scharlau concern; the Myrurgia firm is increasing its output of perfumes; and the Cia. Siderurgica del Mediterraneo, of Bilbao, is enlarging its factory and producing pure benzene and toluene for the dye and explosives industries.

Petroleum Monopoly in Spain

A State monopoly has been established in Spain of the importation, industrial manipulation, storage, distribution and sale of the liquid mineral combustibles and their derivatives which form Group 3 of Class I. of the current Customs Tariff. The monopoly, to be valid for 20 years, is to be administered by a company which is to be wholly Spanish.

Among the obligations imposed on the company are the following: (1) The encouragement of prospecting for natural petroleum in Spain; (2) the distillation of coal, lignite, peat, and shale, and the supply of benzol produced in gas works; (3) the purchase of national spirit for the manufacture of combustible liquids by mixing with petrol; (4) the establishment of stocks of fuel for commercial and military purposes; and (5) the purchase of oilfields abroad, particularly in Spanish America. Within five years the company is to acquire sufficient vessels to transport sufficient oil to meet

national requirements. At the end of the same period the refining industry must be in a position to supply 80% of national consumption. No duties of any kind will be levied on crude petroleum and its derivatives imported by the monopoly, and machinery etc. of a kind not made in Spain for the refining of oil, may be imported duty free. The text of the Decree-Law (in Spanish) may be seen at the Department of Overseas Trade, 35, Old Queen Street, London, S.W.1.

Third Census of Production (Engine and Boiler Packing and Asbestos Trades)

Below are given particulars of the output in the year 1924 of the establishments engaged in the manufacture of asbestos goods and engine and boiler packings and coverings. The figures relate to Great Britain only:—

Products, 1924	Quantity Tons	Selling Value £
Engine and boiler packing and coverings (not including asbestos or metallic packing):—		
Quantities stated	1700	227,000
Quantities not stated	125,000
Total engine and boiler packing and coverings not of asbestos	352,000
Asbestos manufactures (total)	2,717,000
Slag wool and silicate cotton	81,000
Metallic packings	103,000
Other products	327,000
Work done in applying compositions etc.	239,000*
Total value	3,819,000

* Amount received for work done

The aggregates shown above for the year 1924 are believed to cover the bulk of the output of the main classes of products specified, with the exception of metallic packings, to which supplementary amounts of importance may require to be added on the final summarisation of the returns covering the metal industries. The total value of asbestos manufactures and engine and boiler packings and coverings, so far as returned on schedules for this trade, was £3,253,000 in 1924, compared with £908,000 in 1912 and £577,000 in 1907. These sums are inclusive of the value of any part of the slag wool and silicate cotton shown above that was used for other purposes than engine and boiler packings.

Exports of asbestos manufactures in 1924 amounted to 13,960 tons, valued at £957,000, and net imports to 14,850 tons, valued at £231,000. The quantity of engine and boiler packings exported in the same year was 1220 tons, valued at £119,000, and net imports amounted to 87 tons, valued at £20,000. The net output of the factories and workshops engaged in the industry was £2,127,000 in 1924, and the net output per head of persons employed in 1924 was £320, compared with £166 in 1912 and £137 in 1907. The average number of persons employed in the trade in 1924 was 6641, as against 2349 in 1907. The total capacity of engines at work in 1924 in these trades was 5866 h.p., of which nearly 38% was in reserve or idle during the year. In 1912 the capacity was returned as 3729 h.p., and in 1907 as 2286 h.p. The capacity of electric motors at factories was not ascertained in 1907, but in 1924 motors aggregating 7630 h.p., driven by purchased electricity, were recorded. About 14% of the capacity of these motors was shown as in reserve or idle during the year. The capacity of electric generators in factories in 1924 was 2062 kw., in 1912, 1030 kw., and 172 kw. in 1907.

REVIEWS

THE DYEING OF COTTON FABRICS. By FRANKLIN BEECH. Third edition, revised and enlarged, by A. J. HALL, B.Sc. Pp. xii + 296. London: Ernest Benn, Ltd., 1927. Price 18s.

It would be impossible to transform Mr. Franklin Beech's once useful book on cotton dyeing into a volume of practical, as apart from historical, value to-day without robbing it of all resemblance to the earlier editions. Mr. Hall, in thus attempting the impossible, has achieved in full measure the evil result of applying a modern patch to an ancient garment.

In 1901, the date of the first edition, there was no doubt still some demand for a book on dyeing which consisted largely of mere recipes, with a connecting thread of theory and general statement and a little - a very little - chemistry. But nowadays our foreman dyer, even if not, as many are, a graduate of Leeds or Manchester, has usually had sufficient technical training to enable him to work out his own recipes when the properties and reactions of dyestuffs and materials have been lucidly conveyed to him. And though such ability were lacking, has he not shelves filled with the pattern cards and instruction books showered upon him by the colour makers? These not only tell him how to dye a bottle green or a nigger brown, but show him the exact shade of bottle or nigger produced; in brief, recipes without patterns are useless.

For a modern book on dyeing, the work is sadly out of proportion; undue space is devoted to the older dyes, Turkey Red, Logwood Black, etc., whilst the vat colours (except Indigo) are dismissed in two pages and the whole of the Naphthol A S series in nine lines.

The matter is carelessly put together and there are evidences of negligent proof reading. In a series of recipes (e.g. pp. 117-121), the indication which class of colours is being dealt with sometimes occurs in a headline, sometimes in the running text. The NH_2 group is indifferently amido or amino; amino-azo-benzene is scarcely recognisable as benzene-azo-aniline. In the section on union dyeing, Diamine Green G and Diamine Blue RW are given on one page as dyeing wool and cotton the same shade, on the next page they dye wool more deeply than cotton. Very few dyestuffs of any kind are mentioned which first appeared later than 1901, and only in the added chapters do modern British dyestuffs make their appearance.

This third edition is an error of judgment, but from internal evidence it may be gathered that if Mr. Hall were presented with a new fountain pen and sheets and sheets of blank foolscap and persuaded not to hurry he could write an excellent and up-to-date book on the dyeing of cotton fabrics.

REGINALD BROWN

DIE UNIVERSALITÄT DER GRAVITATION IN DEN GRÖSSTEN UND KLEINSTEN SYSTEMEN. By Dr. H. KOLLER-AREY. Pp. 104. Basle: Benno Schwabe & Co., 1927. Price 8 fr.

The author seeks to interpret physical phenomena exclusively with the aid of classical mechanics. He attempts to put the idea of "force at a distance" on a new basis by deriving a new law of gravitation, and claims

that the law is universally valid for both large and small systems. Colloid phenomena, sorption, osmosis, dissolution, and atomic structure are among the subjects discussed. Exactly what reception this book is likely to achieve from those qualified to appreciate it will doubtless be determined by the comparative ascendancy of their convictions and their curiosity. A. A. E.

SECOND EXPERIMENTAL REPORT TO THE ATMOSPHERIC CORROSION RESEARCH COMMITTEE OF THE BRITISH NON-FERROUS METALS RESEARCH ASSOCIATION. By Dr. W. H. J. VERNON. Discussion held by the Faraday Society, March 30, 1927. Pp. 113-204. London: The Faraday Society, 13, South Square, Gray's Inn, W.C., 1927. Price 8s. 6d.

Dr. Vernon's first report was published in 1923. Since that date the work has steadily gone forward, and has led to further most valuable results, which are embodied in the second report.

The research has comprised tests, in indoor and outdoor atmospheres, of six materials, namely, copper, zinc, brass, aluminium, lead, and iron. The marked differences of behaviour observed among these different materials serves to show the complexity of the problem, and indicates how fruitless the task of unravelling the mysteries would have been if Dr. Vernon had adopted a less thorough policy than that actually pursued. As it is, one may fairly claim that the main facts of atmospheric corrosion have been established, and that investigators can now go on to devise methods for mitigation of the damage done by atmospheric attack. Indeed, the present report already suggests preventive measures. It is shown that by heating copper in air at 75-100° C., an oxide-film is produced which, although hardly visible to the eye, serves to protect the metal against tarnishing. It is also shown that the indoor corrosion of iron, which is largely due to suspended solid particles, can be reduced by screening with mushn. Evidence is brought forward of the value of lanoline treatment for the protection of brass.

In a short review it is impossible to give an idea of the wealth of information which can be gained by consulting the report. It must suffice to say that the report contains ten tables of quantitative data, and twenty-nine figures, mostly curves connecting the weight-increment with time. Some of the curves are of forms familiar in previous work, for instance, the parabolic and linear types, but the aluminium specimens yield some interesting new varieties of curves: The amount of corrosion slows off with the time, approaching asymptotically a limiting value, but in some cases the weight, having reached an almost stationary value, discontinuously leaps up again, probably owing to spontaneous cracking of the protective film. The practical importance of these observations is obvious; for details the reader must turn to the report itself. It is, however, impossible to omit an appreciation of the exceptional care which alone has made it possible to obtain such curves at all. The actual weight-increment was in one case as little as 0.000115 grams on a total weight of 50 grams, and it requires no special imagination to recognise the patience which has gone to produce work of this kind. U. R. E.

ADVERTISING, PRINTING AND ART IN COMMERCE. By J. F. PRESTON and E. ARCH. With a foreword by Sir R. A. HADFIELD, Bart., D.Sc., F.R.S. Pp. xvi + 301. London: Chapman & Hall, Ltd., 1927. Price 16s.

This admirable work forms a welcome addition to the recent publications dealing with the study of advertising. The authors have succeeded in presenting the essential facts in a clear and non-technical manner, and it is pleasant to find that they are not averse to the use of a gentle humor to aid the reader in grasping the subtleties of advertising.

The book is divided into three main sections, covering all the psychological and mechanical operations gone through from the customer's original wish to advertise until the appearance of the final printed advertisement. A close study of Sections 1 and 2 by business men who conduct their own advertising without the necessary experience would doubtless lead to a considerable improvement, both in their advertisements and in the results obtained from them.

The authors state that "trade advertising and trade support seem to us to be the most important of all marketing considerations," but the subject is hardly dealt with at all. It is to be hoped that at a later date a chapter will be added giving some detailed consideration to the questions of circulation, choice of journals, and "copy" in relation to advertising in trade journals.

A point of interest to the readers of this JOURNAL is raised in the early part of the book, where, in connexion with the question of fugitive inks, it is said "Here it is that the chemist can be of great service to the advertiser and the good cause of more beautiful publicity matter."

The book is excellently printed, and contains a large number of illustrations which are clear and to the point.
V. R. R.

COMPANY NEWS

COMMERCIAL SOLVENTS CORPORATION

Rapid progress is being made by this company, which was incorporated in 1919 and purchased the Government's plants and research laboratories at Terre Haute, Indiana. The chief manufactures are butanol (normal butyl alcohol), acetone, solvents required for the manufacture of lacquers, varnishes, films, motor-car and other finishes, artificial silk textiles, artificial and patent leathers, drugs, dyes, etc. Butanol is the most important of the company's productions, and is a substitute for fusel oil. The success of this product made it necessary to enlarge the output capacity, the 1927 additions to plant resulting in a further increase in capacity to the extent of 40%. The profit for 1926 amounted to \$1,152,127, compared with a profit of \$650,385 for 1925, a profit of \$701,612 for 1924, and a loss of \$115,526 for 1923.

INTERNATIONAL PAINT AND COMPOSITIONS CO., LTD.

The usual interim dividend has been declared of 3%, less tax, on the preference shares, and 3% interim dividend, less tax, on the ordinary shares.

PINCHIN, JOHNSON AND CO., LTD.

*An interim dividend has been declared on the ordinary shares of 10% actual, less tax, being the same as the interim for the previous year.

RHODESIAN AND GENERAL ASBESTOS CORPORATION, LTD.

The profit for the year ended March 31 last amounted to £244,858 (against £223,241 for the previous year), plus £83,795 brought in. A final dividend has been recommended of 10%, less tax, making 20%. An interim dividend has also been declared on account of the year ending March 31, 1928, of 5%, less tax. During the year a large amount of capital expenditure had been incurred, principally at the Shabanie mine, with a view to increasing the production. When the new plant etc. is in full operation, it is estimated that the output from the Shabanie mine will be increased by 75-100% over the quantity produced during the year ended March 31, 1927. In view of the satisfactory mine developments and the necessity for further additions to the machinery and plant, it has been decided to increase the capital by the creation of a further 50,000 shares.

AGUAS BLANCAS NITRATE CO., LTD.

The eighteenth ordinary general meeting was held on April 29, Mr. W. J. Welch presiding. The year's trading had resulted in a loss of £7350, to which must be added the cost of closing down oficinas and subsequent stoppage expenses. Science had produced several formidable competitors, containing, in some instances, a greater number of units of nitrogen than their commodity, but lacking other elements which time was proving were of considerable value in purifying and enriching the soil. The chairman believed that soon it would be found that the sole use of synthetic sulphate of ammonia—their greatest competitor—might not prove so helpful as was anticipated. Germany had admitted that the returns of crops generally had fallen off, due, it was alleged, to the non-employment of nitrate of soda. Before the war that country consumed from 700,000 to 800,000 tons of the Chilean commodity, but since 1914 the whole of her nitrogen requirements had been met by synthetic sulphate of ammonia. He was of the opinion that in the near future Germany would again turn to nitrate of soda. It would be impossible for the company to resume working operations until the Chilean Government came to the assistance of the industry. In the meantime, they thought it would lead to more economical working later, and help to mitigate the present labour troubles in Chile, if they started extracting caliche on a large scale. Consequently they had instructed their agents to ask the Government to advance the company £50,000 for that purpose.

LONDON AND THAMES HAVEN OIL WHARVES, LTD.

An interim dividend has been declared on the ordinary shares of 5%, free of tax, being the same as for several years past.

CALICO PRINTERS' ASSOCIATION

The net profit for the year ended June 30, 1927, was £223,497 (against £216,228 for 1926), after providing £508,336 (against £511,960) for maintenance, depreciation, repairs, renewals, and upkeep, and £128,000 (same) for debenture interest. With £131,111 brought forward, there was an available balance of £354,608. The directors recommend payment of the balance of the preference dividend, and also a dividend of 7½%, less tax (same), on the ordinary shares, leaving £52,998 to be carried forward.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 —£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£8 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.

Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Grey, £15 per ton. Liquor, 9d per gal. 32° Tw.
 Charcoal.—£6—£9 per ton according to grade and locality.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d. 16° Tw. per gal.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 4s.—4s. 1d. per gal., 60% O.P. Solvent, 4s. 3d. per gal., 40% O.P.
 Wood Tar.—£4 10s.—£5 per ton and upwards, according to grade.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 4½d.—2s. 8d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 1½d.—2s. 5d. per gal. Pale, 95%, 2s.—2s. 3d. per gal. Dark, 1s. 9d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.
 Benzole.—Crude 65's, 10d.—10½d. per gal., ex works in tank wagons; Standard motor, 1s. 3d.—1s. 3½d. per gal., ex works in tank wagons; Pure, 1s. 6d.—2s. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 4d.—1s. 9d. per gal. Pure, 1s. 7d.—2s. per gal.
 Xylol.—1s. 3d.—2s. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 9d.—10d. per gal. Heavy, 8½d.—8¾d. per gal. Standard specification, 7½d.—7¾d. per gal. Salty, 7d. per gal., less 1¼%.
 Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/160, Country, 10½d.—11d. per gal.; London, 1s. 2d.—1s. 4d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, Country, 10d.—11d. per gal.; London, 1s.—1s. 4d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.
 Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—90s.—93s. per ton, f.o.b. according to district.
 Pyridine.—90/140.—5s. 9d.—7s. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.
 Acid H.—3s. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.
 Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene. 9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol. 11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline. 1s. 8d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate. 1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P. Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric. 1s. 6½d.—1s. 7½d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogalllic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 3d.—1s. 4d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d.—2s. 5d. per lb. Potassium.—1s. 10½d.—2s. 0½d. per lb. Sodium.—2s. 1d.—2s. 3d. per lb. Granulated ½d. per lb. loss. All spot.
 Calcium Lactate.—1s. 2½d.—1s. 3½d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730.—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., bulk 2s.—2s. 3d. per gal.; Winchesters, 2s. 11d.—3s. 6d. per gal.; 20 vols., bulk 4s.—4s. 3d. per gal.; Winchesters, 5s.—6s. per gal.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 9s. 6d.—12s. 9d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonol.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 8½d.—1s. 9d. per lb. Crystal, 1s. 9d.—1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonol.—6s. 6d.—6s. 9d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
 Aubepine (ex *Anethole*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. 6d. per lb.
 Ethyl Phthalate.—2s. 9d. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex *Bois de Rose*) 15s. per lb.—(ex *Shui Oil*) 10s. 6d. per lb. Linalyl Acetate.—(ex *Bois de Rose*) 18s. 6d. per lb.—(ex *Shui Oil*) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. 6d. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—17s.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anisc.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.
 Camphor.—75s. per cwt. Cananga, Java, 26s. per lb. Cassia, 80/85%.—7s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%, 22s. 6d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 17s. 6d. per lb. Japanese, 8s. 3d. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Oct. 18th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Sept. 1st. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Burt, Boulton, & Haywood, Ltd. Grinding-machines. 21,297. Aug. 12.

Comyn. Apparatus for separating liquids. 21,068. Aug. 10.
 Duckham, and Woodall-Duckham, Ltd. Tunnel kilns. 21,299. Aug. 12.
 Filtration Engineers, Inc. Filter-cake treating devices. 21,039. Aug. 9. (U.S., 4.11.26.)
 Frankl. Separation of gaseous mixtures. 21,206. Aug. 11.
 Gray. Furnaces. 20,888. Aug. 8.
 Harter. Apparatus for exothermic catalytic gas reactions. 20,869. Aug. 8. (Ger., 10.8.26.)
 Johnson (I.-G. Farbenind.). Purification of gases. 21,105. Aug. 10.

I.—Complete Specifications

2890 (1926). Cabot. Colloidally-dispersed material. (246,874.)
 11,294 (1926). Sandberg. Heat-exchanging device. (255,418.)
 11,808 (1926). Sweetland. Filters. (275,333.)
 18,239 (1926). Nyrop. Apparatus for atomising and drying liquids. (275,404.)
 26,746 (1926). Soc. L'Air Liquide. Carrying out exothermic chemical reactions. (208,722.)
 6126 (1927). Industrial Associates, Inc. Spray-drying. (272,859.)
 *16,619 (1927). Vernay. Thickening filtering-apparatus. (275,573.)
 *17,391 (1927). Electrolux, Ltd. Evaporators. (275,576.)
 *19,187 (1927). Soc. L'Air Liquide. Carrying out exothermic chemical reactions. (275,592.)
 *20,176 (1927). Bisch. Continuous kilns. (275,616.)
 *20,703 (1927). Drying Systems, Inc. Drying-ovens. (275,650.)

II.—Applications

Akt. Separator-Nobel. Separating paraffineous constituents etc. from oils. 21,349. Aug. 13. (Sweden, 24.8.26.)
 Arnold (Standard Development Co.). Manufacture of hydrocarbons. 20,902. Aug. 8. Treatment of hydrocarbon residues etc. 20,957. Aug. 9.
 Berridge. Gas-producing furnaces. 21,340. Aug. 13.
 Capiau, Gauquier, and Lahaut. Removing graphite incrustations from coke ovens etc. 21,072. Aug. 10.
 Florentin, Kling, and Matignon. Obtaining light hydrocarbons from organic compounds. 21,203. Aug. 11. (Fr., 17.12.25.)

I.-G. Farbenind. Hydrogenation of carbonaceous materials. 20,890. Aug. 8. (Ger., 7.8.26.) Production of liquid etc. hydrocarbons etc. 20,891—2. Aug. 8. (Ger., 7.8.26.) Production of liquid etc. hydrocarbons. 20,966. Aug. 9. (Ger., 9.8.26.) Destructive hydrogenation of carbonaceous materials. 21,181. Aug. 11. (Ger., 11.8.26.)

Turnbull. Separating-apparatus for treating coal etc. 20,830. Aug. 8.

II.—Complete Specifications

5736 (1926). Longhi. Splitting fluid hydrocarbons. (275,281.)
 11,423 (1926). Roessler & Hasslacher Chem. Co. Carbonaceous material. (251,982.)
 11,817 (1926). Parker. Fuel. (275,334.)
 4130 (1927). Still. Recovery of by-products in coke oven or like plants. (266,004.)
 10,178 (1927). Bataafsche Petroleum Maatsch., and Rudolf. Treatment or cracking of sludge residues. (270,274.)
 *435 (1927). Plassmann. Low-temperature distillation furnace. (275,546.)
 *18,491 (1927). Soc. Internat. des Proc. Prudhomme-Houdry. Manufacture of synthetic liquid fuels. (275,585.)
 *20,513 (1927). Ges. f. Linde's Eismaschinen. Separation of benzol etc. from cokery or other gases. (275,633.)
 *20,663 (1927). Marchand. Treatment of heavy hydrocarbons. (275,642.)

*20,890 (1927). I.-G. Farbenind. Destructive hydrogenation of carbonaceous materials. (275,662.)

*20,891 -2 and 20,966 (1927). I.-G. Farbenind. A.-G. Manufacture of hydrocarbons and derivatives. (275,663-4 and 275,670.)

III.—Applications

Arnold (Standard Development Co.). 20,902 and 20,957. See III.

McDermott. Purification of benzol etc. 21,362. Aug. 13.

III.—Complete Specifications

• 11,608 (1926). Cross. Producing mixed phenols and related compounds. (275,313.)

*20,513 (1927). Ges. f. Linde's Eismaschinen. See II.

IV.—Applications

Beuss. Manufacture of dyestuffs. 20,989. Aug. 9. (Austria, 2,10,26.)

British Dyestuffs Corp., and Mendoza. Manufacture of intermediate compounds etc. 21,098. Aug. 10.

Soc. of Chem. Ind. in Basle. Dyestuff preparations etc. 21,008. Aug. 9.

IV.—Complete Specifications

6056 (1926). Brit. Alizarine Co., Ltd., Dawson, and Beghin. Manufacture of dyestuffs. (275,283.)

9424 (1926). Carpmael (I.-G. Farbenind.). Manufacture of vat dyestuffs containing sulphur. (275,292.)

11,319 -20 (1926). Carpmael (I.-G. Farbenind.). Manufacture of compounds of the naphthosulfam series and of dyestuffs therefrom. (275,301.)

11,664 (1926). Marks (Du Pont de Nemours & Co.). Catalytic oxidation of hydrocarbons. (275,321.)

17,163 (1926). Durand & Huguenin A.-G. Manufacture of mordant dyestuffs. (275,086.)

20,507 (1926). British Dyestuffs Corp., Shepherdson, and Tatum. Anthraquinone dyes and dyeing therewith. (275,421.)

30,655 (1926). I.-G. Farbenind. Manufacture of indigoid dyestuffs. (262,457.)

*19,985 (1927). I.-G. Farbenind. Manufacture of triaryl-methane-dyestuffs. (275,609.)

*20,087 (1927). I.-G. Farbenind. Manufacture of azo-dyestuffs. (275,613.)

*20,583 (1927). I.-G. Farbenind. Manufacture of condensation products of the anthraquinone series. (275,636.)

V.—Applications

Chamagne. Treatment of marine algae. 21,135—6. Aug. 11. (Fr., 11,8,26.)

Czapek, Weingand, and Wolff & Co. Production of films etc. from viscose etc. 21,314. Aug. 12. (Ger., 13,9,26.)

Ellis (Soc. Fabr. Soie Rhodaseta). Manufacture of artificial threads etc. 21,099. Aug. 10.

I.-G. Farbenind. Manufacture of cellulose derivatives. 20,863. Aug. 8. (Ger., 6,8,26.) Manufacture of cellulose esters of inorganic acids. 21,007. Aug. 9. (Ger., 26,10,26.)

Imray (I.-G. Farbenind.). Manufacture of ethers of earl hydrates. 21,006. Aug. 9.

Vles. Preparing artificial silk. 21,080. Aug. 10.

Want. Preparing artificial silk. 21,258. Aug. 12.

V.—Complete Specifications

8276 (1926). Dreyfus. Manufacture of cellulose derivatives. (275,286.)

22,615 (1926). Erste Bohmische Kunstseidefabr. Manufacture of artificial textile threads. (258,582.)

*20,493 (1927). Overstrullen. Extracting and purifying fatty materials from washing waste waters. (275,627.)

*20,602 (1927). Bemberg A.-G. Production of artificial silk. (275,637.)

*20,617 (1927). Elöd. Production of cellulose esters. (275,641.)

*20,708 (1927). I.-G. Farbenind. Application of cellulose ethers or esters. (275,653.)

*20,863 (1927). I.-G. Farbenind. Manufacture of cellulose derivatives. (275,660.)

VI.—Application

Lord, and Tootall Broadhurst Lee Co. Mercerising textile fibres. 20,816. Aug. 8.

VI. Complete Specifications

11,543 (1926). Imray (I.-G. Farbenind.). Dyeing cellulose acetate silk. (275,307.)

11,731 (1926). Carpmael (I.-G. Farbenind.). Dyeing and printing with ice colours. (275,326.)

12,928 (1926). I.-G. Farbenind. Dyeing cotton with vat- and azo-dyestuffs. (252,384.)

13,256 (1926). Calico Printers' Assoc., and Whitfield. Ornamentation of artificial silk fabrics. (275,357.)

13,710 (1926). Winter and Jordan. Apparatus for bleaching, dyeing, etc. yarns or fabrics. (275,363.)

14,757 (1926). British Dyestuffs Corp., Horsfall, Lawrie, and Hill. Dyeing cellulose esters and ethers. (275,373.)

14,799 (1926). Haberkorn. Protection of fibrous materials during chemical treatment. (275,374.)

20,507 (1926). British Dyestuffs Corp., Shepherdson, and Tatum. See IV.

7458 (1927). Durand & Huguenin. Products for dyeing or printing. (267,952.)

7939 (1927). Durand & Huguenin. Dyeing animal fibres. (267,986.)

*5381 (1927). Soc. Chim. Usines du Rhône. Colouring cellulose esters and ethers. (275,553.)

VII.—Applications

Blumenfeld. Preparation of titanium etc. compounds. 20,987. Aug. 9. (U.S., 9,8,26.)

Büsching. Denitration of waste acid mixtures. 21,044. Aug. 9. (Ger., 3,9,26.)

Chem. Fabr. Gross-Weissandt, and Seidler. Preparation of large sal-ammoniac crystals. 21,046. Aug. 9. (Ger., 10,8,26.)

Crosland. Kilns for calcining lime etc. 21,239. Aug. 12. Evans. 20,827. See X.

Grothe, and Metallhütte Magdeburg. Treating copper etc. containing lyes. 21,209. Aug. 11. (Ger., 11,8,26.)

I.-G. Farbenind. Recovery of copper from liquors by precipitation. 21,346. Aug. 13. (Ger., 14,8,26.)

Neill. Preparation of iron compounds from solutions of iron. 21,045. Aug. 9.

Traun, and Traun & Solme. Container for hydrofluoric acid etc. 21,073. Aug. 10. (Ger., 18,1,27.)

VII.—Complete Specifications

29,390 (1926). Rhenania-Kunheim Ver. Chem. Fabr. Production of solid ammonium carbonate. (275,459.)

29,998 (1926). White (Dwight & Lloyd Metallurgical Co.). Treatment of carbonate materials. (275,463.)

*17,627 (1927). Titan Co. Akt. Dissolving titaniferous materials in acids. (275,578.)

*17,628 (1927). Titan Co. Akt. Treatment of titaniferous materials. (275,579.)

*17,629 (1927). Titan Co. Akt. Utilising titanium materials containing iron. (275,580.)

*20,987 (1927). Blumenfeld. Preparation of titanium and like compounds. (275,672.)

VIII.—Applications

Johnson (I.-G. Farbenind.). Production of silica. 21,104. Aug. 10.

United States Metals Refining Co. Magnesite refractories. 21,343. Aug. 13. (U.S., 8,6,26.)

VIII.—Complete Specification

*7890 (1927). Hartford-Empire Co. Glass furnaces. (275,555.)

IX.—Applications

Dowdeswell. Asphaltic paving-compounds. 20,838. Aug. 8.
Kobiolke. Preserving timber etc. 20,976. Aug. 9.

IX.—Complete Specifications

13,732 (1926). Westrum. Manufacture of bituminous concrete. (275,364.)
26,803 (1926). Bia, and Granville de Bielize. Manufacture of artificial marble. (275,448.)
4509 (1927). Aerni. Manufacture of artificial stone. (266,364.)
7393 (1927). Ackermann, and Scheidhauer & Gessing A.-G. Manufacture of bricks. (267,948.)

X. Applications

Dufour and Metzner. Obtaining low-fusion dental alloys. 21,215. Aug. 11.
Evans. Utilisation of waste iron pickle. 20,827. Aug. 8.
Grah. Chromium plating. 21,191. Aug. 11.
Grothe, and Metallhütte Magdeburg. 21,209. See VII.
I.-G. Farbenind. Magnesium alloys for pistons of internal-combustion engines. 20,920. Aug. 8. (Ger., 13.8.26.) 21,346. See VII.
Jackson (New Jersey Zinc Co.). Reduction of zinciferous materials. 20,909. Aug. 8.
Klopsch. Protective treatment of iron etc. 21,108. Aug. 10.
Mond (Norddeut. Chem. Fabr. in Harburg). Recovering lead etc. from lead-sulphur compounds. 20,919. Aug. 8.
Schrobsdorff. Producing alloys of refractory carbides. 21,260. Aug. 12. (Ger., 12.8.26.)
Soc. Anon. des Acieries et Forges de Firminy. Protection of metals in cementation process. 21,286. Aug. 12. (Fr., 7.9.26.)
Taylor. Electrodeposition of metals. 21,195. Aug. 11.
Vogel. Pickling iron etc. 21,302. Aug. 12. (Ger., 8.9.26.)

X.—Complete Specifications

11,989 (1926). Harris. Refining and separation of metals. (275,344.)
12,192 (1926). Gustafsson. Producing metals in electric furnaces. (252,162.)
29,930 (1926). Gustafsson. Producing malleable iron and steel directly. (262,126.)
29,931 (1926). Gustafsson. Producing iron and steel. (262,127.)
*11,441, 11,445, 11,448 (1927). Guggenheim, MacGowan, and Smith. Flotation processes. (275,561-2.)
*19,653 (1927). Krupp A.-G. Operating shaft furnaces. (275,601.)
*20,231 (1927). Metallbank u. Metallurgische Ges. Converting tin ores. (275,618.)
*20,690 (1927). Wüst. Furnaces for treating iron with a low proportion of carbon. (275,646.)

XI.—Applications

Baesa. Production of nickel oxide electrodes. 20,853. Aug. 8.
D. P. Battery Co., Ltd., and Waddell. Secondary batteries. 21,363. Aug. 13.
Frost and Parrington. Manufacture of electrodes. 21,025. Aug. 9.
Stewart. Metallic filaments for electric lamps. 21,219. Aug. 11. (Ger., 18.9.26.)
Taylor. 21,195. See X.

XI.—Complete Specifications

12,192 (1926). Gustafsson. See X.
13,365 (1926). Marks (Munroe & Co.). Anode. (275,359.)
17,019 (1926). Burgess Laboratories, Inc. Galvanic cells. (255,067.)
17,020 (1926). Haddon and Burnett. Accumulator plates. 275,392.)

18,014 (1926). Krupp A.-G. Electric resistance furnaces. (257,896.)

19,816 (1926). Oldham & Son, Ltd., and Darby. Galvanic batteries. (275,418.)

26,913 (1926). Wade (N. V. Philips' Gloeilampenfabr.). Incandescent cathodes. (275,449.)

*20,059 (1927). Dufour. Electric furnaces. (275,611.)

XII.—Application

Industrial Spray-Drying Corp. Manufacture of soap product. 20,817. Aug. 8. (U.S., 25.5.27.)

XII.—Complete Specifications

*23,140 (1926). Metallbank u. Metallurgische Ges. Treating crude oils and fats. (275,536.)
*16,763 (1927). Harvel Corporation. Treating cashew nut shell and like oils. (275,574.)
*20,493 (1927). Overstraten. See V.

XIII.—Complete Specifications

502 (1927). Production of coats of lacquers, oil paints, etc. (275,477.)
*19,841 (1927). Bakelite Corp. Artificial resin compositions. (275,604.)
*19,989 (1927). Tauber. Coating and binding compositions. (275,610.)
*20,707 (1927). I.-G. Farbenind. Varnishes etc. (275,652.)

XIV.—Application

Dunlop Rubber Co., Ltd., Murphy, and Twiss. Production of sheet rubber etc. 21,262. Aug. 12.

XIV.—Complete Specification

6451 (1926). Grasselli Chem. Co. Vulcanisation of rubber substances. (249,113.)

XV.—Application

Geigy A.-G. Process for preparing tanning agents. 21,305. Aug. 12. (Ger., 16.8.26.)

XVI.—Complete Specification

*25,739 (1926). I.-G. Farbenind. Fungicide. (275,539.)

XVIII.—Complete Specifications

11,743—4 (1926). Distillers Co., Ltd., and Meyer. Manufacture of yeast. (275,328—9.)
28,897 (1926). Siemens & Halske A.-G., Engelhardt, and Engelhardt. Ageing of alcoholic liquors and the like. (275,454.)

XIX.—Applications

Kobiolke. Destruction of insect pests in food products etc. 21,001. Aug. 9.

Salerni. Manufacture of chocolate etc. 21,303. Aug. 12.

XIX.—Complete Specification

14,821 (1926). Bamford. Making aqueous emulsions of dried milk or milk powder. (275,375.)

XX.—Applications

Chem. Fabr. vorm. Schering. Manufacture of thymol etc. 21,221. Aug. 11. (Ger., 16.8.26.) Manufacture of disodium salts of sulphomethylaminomethylmercapto sulphonic acids. 21,018. Aug. 9. (Ger., 8.2.27.)
I.-G. Farbenind. Manufacture of 1-amino-3-dialkylamino-2-propanols. 21,300. Aug. 12. (Ger., 13.8.26.)
Soc. Chem. Ind. in Basle. Manufacture of condensation products from formaldehyde etc. 21,113. Aug. 10. (Switz., 11.8.26.)

XX.—Complete Specifications

3274 (1926). Carpmacel (I.-G. Farbenind.). Manufacture of alkoxyaminoquinolines. (275,277.)
6103 (1926). Johnson (I.-G. Farbenind.). Manufacture of organic compounds containing oxygen. (275,284.)
11,664 (1926). Marks (Du Pont de Nemours & Co.). See IV.
12,228 (1926). Synthetic Ammonia & Nitrates, Ltd., and Smith. Production of methanol and other oxygenated organic compounds. (275,345.)

12,059 (1926). *B&C*. Production of iodized pyridine derivatives. (252,707.)

14,666 (1926). Darrasse, Darrasse, and Dupont. Manufacture of synthetic camphor. (253,542.)

15,242 (1926). Mackert. Catalytic methylation of ammonia and organic amines. (275,377.)

28,042 (1926). Consort. f. Elektrochem. Ind. Manufacture of polymerised vinyl esters. (261,406.)

*19,071 (1927). Bunz and Rätz. Production of nitro-pyridine arsinic acids. (275,590.)

*19,649 (1927). Comp. de Bethune. Catalysts for the synthesis of alcohols. (275,600.)

*20,472 (1927). L.-G. Farbennind. Manufacture of unsymmetrically-substituted diamino-propanols. (275,622.)

XXI.—Applications

Carpmael (Powrie). Colour photography. 21,310. Aug. 12.

Marconi's Wireless Telegraph Co., Ltd. Sensitised papers etc. for picture etc. telegraphy. 21,360. Aug. 13. (U.S. 14,826.)

XXI.—Complete Specification

11,787 (1926). Thornton. Kinematograph colour films. (275,331.)

XXII.—Application

Büsching. 21,044. See VII.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *Australia*: Machinery for bottling and bottle washing, bottle and can labelling, filling machines, sauce preparation plant, cereal manufacturing and auxiliary machines, corking and sealing plant, beverage making equipment, etc. (130); caustic soda primary cells (B.X. 3717). *British India*: Oxy-acetylene cutting plant, hydraulic press, spring steel (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Dominican Republic*: Corrugated iron sheets (147). *Egypt*: Oil engines, pumps, pipes (143). *Peru*: Earthenware (149). *Portugal*: Heavy chemicals, fertilisers (141). *New Zealand*: Gift or gold and other suitable papers for covering fancy chocolate boxes (B.X. 3707); cast-iron water pipes (A.X. 5031). *South Africa*: Structural steelwork (A.X. 5057); steel boiler tube ferrules (A.X. 5055); copper and steel plates (A.X. 5058). *Turkey*: Galvanised-iron wire (A.X. 5025).

Safeguarding of Key Industries

The Board of Trade announces that the Treasury has exempted from duty under the Finance Act, 1926, imported ethylene glycol (glycol: alcohol ethylene), and glycol ethers, from August 19, 1927, to March 6, 1928. The Treasury Order will be published shortly.

News from Advertisements

The University of Manchester announces particulars of its chemistry courses and of admission to the research laboratories (p. vi).

The proprietors of the British patent relating to synthetic production of ammonia are desirous of negotiating with interested parties (p. vi).

A chemist with experience in inorganic preparations is required (p. vi).

A chemical laboratory assistant is required by the Experimental Department of the Fine Cotton Spinners' and Doublers' Association (p. vi).

A single cylinder vacuum drying machine is for sale (p. vi).

An old-established chemical business is for sale (p. vi).

Radium element. 20.98 milligrammes for sale (p. vi).

The City of Cardiff Education Committee announce particulars of their courses and open scholarships (p. vi).

A platinum basin, crucible and lid, are for sale (p. vi).

There are 111 firms represented under various headings in our Buyers' Guide.

EDITORIAL

A Golden Wedding

PROFESSOR AND MRS. ARMSTRONG have this week celebrated the fiftieth anniversary of their wedding day, and were "At Home" to their relations and a few intimate friends at the house of their daughter, Mrs. Stephen Miall. They have played conspicuous parts in the history of modern British chemistry, and the celebration deserves therefore some notice. Professor Armstrong includes among his old students many who are well-known figures in chemical circles, for instance, Profs. Sir William Pope, Lowry, Forster, Lapworth and Philip. He has been intensely interested not only in chemistry, but also in his students, and his house in Lewisham was frequently visited by them not only while they were his students, but long after they had made their mark in teaching, in industry, or in research. His house has been a happy meeting place for chemists of all ages and many nationalities, and very many of these have on divers occasions, including this present one, shown their gratitude for the inspiration they owed to the professor and the hospitality they received from him and his wife. One of their daughters lives in America, and she and her family were not present on this occasion; but the other children and grand-children were present, all in good health and good spirits. The professor's children are, some of them, so well known as to require no introduction to the readers of this journal; the grand-children are on the whole not inordinately shy, nor reticent of their opinions, nor inclined without argument to accept the views of their seniors; some of them have a determination which verges on obstinacy. To what extent the characteristics of the young depend on heredity or on environment is a question which has puzzled all the pedagogues and psychologists, and is far beyond the intellectual level of a mere editor. We never knew the professor in his tender years, and cannot say whether he did as he was bid or did as he was bad. We have alluded to his singular gifts as a teacher; as a writer, he has advised his fellow creatures on many occasions and on many subjects; we think that he must have been profoundly

influenced by Carlyle and by Ruskin, followers in a way of the wise Socrates. If we had all followed the advice of Armstrong, or indeed of any of the other three great preceptors, the world would have been very different. People do not, however, take advice, and the professor has, often and often, urged them not to do as they are told. Whether the professor expects us to follow the path he points out or not, or whether he even wishes it, we hope he will long continue to exhort us, to instruct us, and to mingle his irony and humour with erudition and that long experience that doth attain to something like prophetic strain.

French Industrial Progress

Our esteemed contemporary *Chimie et Industrie* published some little time ago the second part of *Dix Ans d'Efforts Scientifiques et Industriels 1914—24*. This handsome volume of about 1500 pages is well written and well illustrated, and it gives a most interesting account of the economic organisation of France, of the colonial progress of France, and of the resources of the French colonies during the years in question, ending with an account of the principal fuel, mining, chemical, and transport companies in France. The French colonies are but little known to the average Englishman. They include, however, an enormous area in Africa, nearly half that continent being either French or under French administration; they include also a large colony in Indo-China, and a few small ones in India, the large colony of Madagascar, and a score of islands in the Pacific, in the Indian Ocean, and in the Atlantic. Those who wish to study the production of tobacco, cotton, olives, dates, vines, iron, zinc and lead, in the eastern (French) half of Africa will find full information about these, the railways over which they are transported, the ports whence they are shipped, and so on. The cattle and sheep in different countries, the native timber, the rubber plantations, the ravages of locusts and other insect pests are fully described, and the descriptions are enriched by many beautiful illustrations. In a later part of the volume will be found

accounts of the Kestner evaporators, De Dietrich & Cie, the Société Dorr, the Salerni Low Temperature Carbonisation, the Sharples Centrifuge, the Comptoir Français de L'Azote, the coal-mining companies of the north of France, the Société Le Nickel, the Schneider works, the Vieille Montagne, the Potash works of Alsace, the Etablissements Bertrand Produits Chimiques, the Usines Dior, the Etablissements Kuhlmann, Poulenc Frères, and the works of Saint-Gobain, Chauny et Cirey, which some of us visited in 1919, and shall not forget. Many other companies and works are described, and the whole volume is a worthy record of a great and successful industrial effort.

Beet Sugar

We hope it will not be long before an authoritative account is published of the work on the De Vecchis beet sugar process which is being carried out by the Institute of Agricultural Engineering in its laboratories at Oxford and small works at Eynsham, a few miles from Oxford, but in the meantime we may note with satisfaction the progress in the production of beet sugar by the older processes as revealed in the most recent official announcement of the Ministry of Agriculture and Fisheries. Although we cannot hope that the extent of ground under beet will increase in the future at the same geometrical rate of progression as in the last three years, we are glad to see an even better type of progress, namely, in respect of the actual working of the factories, fourteen of which were in operation during the season 1926-7 as compared with nine during the 1925-6 season. The acreage under beet during 1926-7 was about 130,000, as compared with 56,000 acres during the preceding season, but furthermore, in three important particulars—the yield of beets per acre, the average sugar content of the root, and the average amount of sugar extracted—a considerable advance is recorded by the Ministry. Almost a ton more beet root was grown per acre in 1926-7, the average crop being 8.63 tons per acre, whilst the average sugar content was almost 1% higher at 17.31% on the beets. The figure which reflects the growing efficiency of manufacturing operations, however, is that relating to the extraction of sugar, expressed as a percentage of the beets treated. Although the beets contained, as we have stated, almost 1% more sugar than in the previous year, nearly 2% more nett sugar was obtained, the actual figure being 13.83%. It is, therefore, not surprising that three times as much sugar was made in the 1926-7 season as in the previous season, whilst the acreage under beet cultivation has only increased some 2½ times.

We are disinclined to express any opinion as to the chances of the beet sugar industry in this country when the time shall come for the withdrawal of the subsidy, but the comparisons we have just made offer abundant cause for hoping that the industry will prosper under economic conditions which are bound to be difficult. The main factor would appear to be the supply of the roots at a price which the industry will be able to pay, but if the farmer profits sufficiently from his own continued experience with the beet crops, from the employment of specially prepared fertilisers and improved labour-saving devices, and from the help which the specialists in beet seed are able to afford, there would appear to be

no reason why the manufacture of beet sugar in this country should not be mutually profitable to both manufacturer and farmer.

There are several reasons why the work on the De Vecchis process is of special importance to the beet sugar industry, and in the forefront stands, in all probability, the fact that the making of sugar could be a continuous operation throughout the year, instead of being confined to a third or a quarter of the year. The effect upon overhead costs alone needs no stressing. The De Vecchis process embodies, of course, the fundamental stage of drying the beets and bringing them into such a general condition as will permit of long storage without detriment to the quantity or quality of their contained sugar. At the same time, the beets dried down by the elimination of 75% of their original content of water could be treated with water at any time suited to the factory operations to give a 50% solution of sugar. The troublesome problem of effluent disposal would be largely solved, so that one barrier would be removed from the path of the engineer.

We have noted above the increase in the amount of sugar recovered as such from the beets, and if this can be raised still higher an obvious decrease in the cost of the final product must result. It is an important phase of the De Vecchis process that the immediate dehydration of the fresh root brings about such an increased sugar return in the end. At present there is involved a considerable loss in sucrose between the uprooting of the crop and its treatment in the factory—17.31% of sugar in the beet, 13.83% of sucrose finally obtained during the 1926-7 season—due to the inverting action of enzymes, fermentation, insect pests, natural cellular respiration, and other causes. Cellular respiration alone is responsible for very large decreases in ultimate sugar yield, and we recollect that Dr. C. A. Browne, Chief of the Bureau of Chemistry, U.S. Department of Agriculture, recently estimated that the actual destruction of sucrose from this cause alone during the storage of beets between digging and slicing was responsible for an annual loss of five million dollars in the United States. Further, a similar monetary loss obtains in the factories, due to the inability to recover as much sugar on account of the presence of non-sugars formed and rendered soluble by metabolic changes taking place in the beets during storage.

If the De Vecchis process can supply dried and easily transportable beets to factories working all the year round, can conserve sucrose as such in the dried beet, can facilitate operations in the factory and help solve location and effluent disposal difficulties, it will go far to prepare the British sugar industry for the eventual economic struggle. Estimates of the cost of drying beets by an elaboration of the De Vecchis process already worked out in broad outline by the investigations of the Institute of Agricultural Engineering have been made which do not place the process in too unfavourable a light. We are sure that the British beet sugar industry, present and prospective, would welcome a full report of investigations made up to the present, even if finality cannot be claimed one way or the other. Such a report would considerably assist the definite formulation of next season's plans.

THE MOULDING AND VULCANISATION OF RUBBER ARTICLES

By H. WILLSHAW

(Concluded)

Generally, where a large mass of rubber, such as a solid tyre or rubber block and the like, is to be vulcanised, a slow heating or warming-up period is given, to bring the mass to a general temperature throughout, following which the temperature is raised to effect vulcanisation.

The articles cured on these lines have what is called "stepped" vulcanisations to distinguish them from those where the steam pressure immediately rises to a maximum vulcanising pressure, and is held there over a definite time.

Accelerators

Many rubber goods, especially such items as pneumatic and solid tyres, require a very lengthy period of vulcanisation, and in view of the heavy cost of this operation through this factor of time and the additional factor of expensive plant, every effort is made to reduce the time for vulcanisation.

The substances which have been used to reduce the time for vulcanisation are known as accelerators. Common forms are litharge, magnesium oxide, derivatives of aniline, etc.

If the material is thin, and where rubber mixings are used containing such active accelerators as xanthate, appreciable vulcanisation may take place at ordinary room temperatures, and with development along these lines, it is quite possible that with such articles, separate vulcanising operations may not be necessary.

On the chemical action of such accelerators the author does not propose to touch, but refers to them as a means whereby the chemist can co-operate with the engineer in reducing moulding costs.

Although the foregoing descriptions have referred to the moulding and vulcanisation of tyres, practically all rubber articles follow one of the processes described, as for example:—

Rubber heels and the like.—These are roughly shaped from unvulcanised rubber, placed in a plate mould, having cavities for 20–30 shapes, and the mould is placed between steam chests and vulcanised while hydraulic pressure is applied. The method for such articles very closely resembles the process described for solid tyres, although it must be understood that the moulding equipment is much lighter and does not call for the mechanical help required with heavy moulds.

Rubber toys, play balls and the like.—The manufacture of these classes of hollow rubber articles follows to a great extent the process and principles of moulding described for the present-day cord tyre, vulcanised against air pressure, while subjected to hydraulic pressure, or other means of mould closing. For example, rubber balls and toys are formed to rough shape from unvulcanised rubber and are inflated during vulcanisation by the introduction of pressure from an outside source, or are caused to expand against the mould during vulcanisation by the use of chemicals, such as ammonia

or ammonium nitrite, mixed with sodium chloride, which causes pressure amounting to several atmospheres to be exerted inside the ball during vulcanisation.

Naturally, in such cases as this, it is necessary to reduce the pressure by cooling before opening and emptying the mould.

Brief survey of present-day moulding equipment

Mould design.—Much has already been said about moulds in this paper, and a brief description of mould design and construction will here not be out of place.

On account of the repetition of heavy stresses which are set up during the moulding of a tyre, and the necessity to keep down the weight and thickness of moulds for ease of handling and to give maximum autoclave capacity, it has become the general practice nowadays to make moulds in steel. A further advantage of steel over cast iron or semi-steel, which were previously used, is the much better surface finish obtainable.

Steel castings generally are most suitable for moulds of intricate shape, as there is far less waste of material and machining than when steel forgings are used. The one drawback is that steel castings are more subject to surface blemishes. The weights of steel moulds for sizes generally moulded in autoclaves vary from 7 to 35 cwt. each, and it will be obvious that these weights would be greatly increased if cast iron were used.

As regards the design of the tyre mould, the first object is to get a perfectly-moulded tyre, which requires very careful machining work to gauges, so that the volume of the mould cavity and the shape are correct to close limits, and this is especially so in the case of tyres moulded on solid cores. One of the problems in tyre moulding is to ensure that all air is expelled from the mould, and for this purpose channels are cut from any isolated blocks in the pattern and from the shoulder of the tyre to permit the air to flow away to the joints of the mould. In some cases air holes are drilled through the sides.

Care is required in getting a correctly-proportioned spew groove at the joint of the moulds, this being very essential in the case of a solid tyre, to meet the two following conditions:—(a) To provide sufficient resistance to the outward flow of the rubber when the ram is forced back, and (b) to permit the ram to close the mould again by squeezing through the spew. In the case of the present-day pneumatic cord tyre, broad, flat surfaces are permissible, as there is no necessity for the mould to open, although this does actually occur, as there is always a little spew.

Deep-wearing surfaces on the spigots and bead ring joints are essential, otherwise wear rapidly takes place, causing a step on the joint of the tyre at the crown, due to the eccentricity of the two halves of the mould. At the same time, the depth of these joints must not be such as to interfere with the free opening of the moulds.

The outside shape of the moulds is determined by the requirements of the handling and conveyor system, but, apart from this, it is necessary to provide steam grooves on the backs of the moulds to ensure that the steam shall circulate between the mould surfaces with the consequent

necessary heating effect to the side of the tyre. These grooves also serve the purpose of inducing circulation in the pan.

Mould manufacture. Pattern cutting.—The initial machining operations on the mould follow the usual machine-shop practice, but it is general to use formed tools for the final finish of the tyre contour, leaving the mould ready for its particular pattern engraving.

This is done generally with an engraving machine employing copying mechanism based on the principle of the pantograph, but more and more frequently the pattern is being formed by riveting or welding on steel stampings, and sometimes white metal stampings or castings, methods which reduce the cost of the mould very considerably.

In some cases loose rings carrying the pattern are fitted into the mould; but when this is done it is very essential that care should be taken to prevent the pocketing of water from the steam under these rings, as the sulphur forms sulphuric or sulphurous acid during vulcanisation, and this rapidly attacks the joints between the mould body and the inserted ring.

Mould handling and conveying

Power conveyors.—Reference has been made to the efforts of the chemist towards reducing moulding costs; and now the work of the engineer comes under consideration.

The main problem confronting the engineer is that of making possible the rapid handling of moulds in and out of the vulcanising vessels or by the speeding-up of operations carried out on presses themselves wherein the mould is a fixture.

The moulds are fed by means of travelling apron or chain conveyors, and after vulcanisation are removed from the vulcanisers by suitable power means, to be conveyed to opening stations, where by hydraulic means they are opened, oyster fashion.

The upper half of the mould is then conveyed through its cleaning station by means of the overhead conveyor, whilst the lower half of the mould, travelling along its conveyor, has the vulcanised tyre ejected from it—again hydraulically—is cleaned, re-loaded with an unvulcanised tyre, and travelling along, meets its upper half, which is located accurately upon it, and both are conveyed to the autoclave for loading, thus completing the cycle.

Such an installation as that described has no extraordinary features about it, and similar conveyors are common throughout the country.

The combination, however, of a cable conveyor with a slat conveyor may be worth commenting upon, as the careful calculation of the exact speeds necessary is essential to ensure that the upper and lower halves of the mould meet as accurately as possible.

Since stoppages may occur on one or other conveyor, stop and start switches in easily accessible positions are so arranged that the two conveyors may be kept synchronised as regards movements.

Safety methods.—With such conveyor systems must be borne in mind the necessity of providing adequate safety controls, both for the protection of the operators concerned and for the maintenance of the conveyor.

Costs of moulding

It will be apparent from the various descriptions that the services required for moulding and vulcanising installations are of a very expensive character, and that the cost of steam, high-pressure water and high-pressure air means that the manufacturer has to exercise the utmost care in preventing unnecessary use of any of these services.

For example, the cost of an installation for a battery of 20 autoclaves, as that described, would be to-day around £50,000, exclusive of moulds.

In so far as the cost of moulds is concerned, this ranges from £15 to £25 for cycle moulds, which, of course, are of comparatively light weight, and from £30 upwards to £125 according to size for car and truck pneumatic tyre moulds.

If we consider that this initial expenditure on the moulds is spread over the whole of the tyres produced from each mould, it must be conceded that the actual cost per tyre, with the mould constantly in production, is comparatively small in the smaller sizes of moulds, as the following schedule will show, but for larger sizes it will be seen how heavy a charge is placed against moulding costs—more especially should the life of the mould, due to changes of design etc. be comparatively short.

	Weekly output Two 48 hr shifts		Yearly output.
Cycle moulds used in individual presses	600	1 000	30,000—50,000
Light-car moulds used in individual vulcanisers	100	200	7,000—10,000
Car and pneumatic truck tyres moulded in autoclaves	25	50	1,250—2,500
Solid tyres cured in autoclaves	20	30	1,000—1,500

In the case of the hydraulic service, it is general for low-pressure water to be used for all ram movements, which are necessary for the loading and unloading of the moulds from vulcanisers, and the high-pressure water is only used for final mould closing and onwards during the vulcanisation period.

As regards steam, the amount of steam required for a battery of 20 vulcanisers is approximately 10,000 lb. per hour. Also to complete this installation, 1000 cb. ft. of free air, together with 8000 gals. of high- and low-pressure water, are required, whilst cooling water consumes approximately 10,000 gals. per hour.

A further important point is the matter of floor space affecting floor charges. Such an autoclave installation as that described works out at 67 sq. ft. of floor area for every tyre moulded per hour.

It will be appreciated by the engineer that all this means heavy cost on the final production of rubber articles, and it is worth while comparing the vulcanisation of heavy goods described with that of similar articles which are now vulcanised in individual vulcanisers, where hydraulic pressure is eliminated and the amount of steam required for vulcanisation is reduced by approximately one-half, on account of the fact that there is less metal to heat up and the loss due to condensation is much less, whilst the installation of, say, 50 such vulcanisers will only represent a capital outlay of around £10,000.

In addition to the help that the chemist is giving with developments in the use of accelerators, with corresponding reduction in time required for vulcanisation,

the automobile engineer, by improving the springing of chassis and reducing the unsprung weight of the various component parts, is enabling the tyre manufacturer to utilise tyres of lighter construction and small cross-section, thus making possible the introduction and standardisation of individual vulcanisers to a greater extent than hitherto, with a consequent reduction of both capital outlay and moulding costs.

Bakelite, casoid, galalith and ceramic moulding

This paper would not be complete without making reference to other articles that are moulded, such as "bakelite" etc.

In the main, the moulding of "bakelite" has much in common with the moulding of rubber goods. The content of the mixed powder bears a definite relationship to the mould cavity. The main difference is that the powder can be poured into the mould direct or pressed beforehand into "tablet" form and then placed into the mould.

The mould design is similar to that described previously except that the smaller nature of the work enables the moulds to be economically housed in steam-heated platens, and also in the case of patterned moulds the pattern can be produced by hydraulic pressure from a master instead of being cut individually as in the case of the larger moulds.

With regard to moulding temperatures and pressures, these approximate very closely to those previously given, i.e., 300° to 350° F. and 1500 to 2000 lb. per sq. in. of mould surface.

During moulding—due to the pressure placed upon it—"bakelite" contracts to 25% of its original bulk, and therefore to obtain the best results it is essential to ensure that the hydraulic pressure is sufficiently high to obtain complete consolidation of the powder.

Small moulds which can be spaced in series on a platen are usually arranged so that between the two halves of the mould is a small space which is similar to the spew groove in the tyre mould, and into which any surplus powder is forced. These moulds are known as "flash" moulds.

Platens for moulds are so formed as to permit either of rapid heating or cooling, and the presses wherein these platens are fixed are usually designed so that the press on the lower portion of its opening stroke automatically ejects the "mouldings" from the moulds. More recent experience of this class of material has shown that where the "mouldings" are thin, the cooling of the moulds in the platens is unnecessary.

Casoid, erinoid, galalith.—These substances, which have a common base of casein material, have not as yet reached that stage of development wherein moulding is a definite process of manufacture, and judging from the experience gained in the handling of these substances, a fair amount of research work will have to be carried out before it can be said that moulding is a process which can be successfully performed on them.

At the present stage of developments the prepared casein substance is generally drawn to an approximate shape and pressed between steam-heated platens against hydraulic pressure approximating to 1½ tons per sq. in. of platen.

These materials, however, differ from rubber articles inasmuch as contraction takes place instead of expansion during the pressing operation, following therefore the characteristics of "bakelite" in this respect.

Subsequent to pressing, the casein material in its various shapes is subject to immersion in formalin solution which might be considered as analogous to the vulcanisation of rubber.

Ceramics.—There are a variety of ways in which clays are conducted through their moulding processes such as "throwing," "jollying," "pressing," etc., but the only one which may be said to come within the scope of this paper is that of "pressing."

Pressing is carried out in moulds which are designed similarly to those before described for "bakelite" and, like them, provided with grooves for the flash or spew.

The mould halves are mounted in steam-heated platens fixed in suitable fly or hydraulic presses. The pressure required varies according to the nature and volume of the work required, and may reach 5000 lb. per sq. in. on the ram.

The clay is taken from the press cloths, allowed partially to dry, and is then placed in a pulveriser from which it emerges in the form of a fine powder. This powder is poured to excess, since it contracts under pressure, in the lower half of the mould, the press closed and the surplus material forced into the flash grooves, whence it is usually trimmed off by the cutting edge on the top half of the mould.

Types of articles manufactured under this process are tiles, electric insulators, etc.

In conclusion, the author wishes to acknowledge the help given towards the compilation of this paper by Messrs. the Dunlop Rubber Co., Ltd., Messrs. the Darnall Lacquer Co., Ltd., Birmingham, and H. C. Young, Esq.

MINING AND METALLURGY IN CANADA

The Consolidated Mining and Smelting Co. at Trail has produced excellent electrolytic iron from the waste pyrrhotite of the Sullivan mine. The company has acquired chrome iron ore deposits at Rossland, evidently with the intention of manufacturing ferro-chrome alloys.

The Hollinger Consolidated Gold Mines, Ltd., recovered in 1926 gold of the net value of \$14,780,636. Dividends paid during the year amounted to \$5,805,000. The average value of ore milled was \$7.99, and the quantity was 1,932,559 tons. The cost of production was less than \$4.00 per ton.

The Canadian Bronze, Ltd., with headquarters in Montreal and subsidiaries at St. Thomas, Ont., Winnipeg and Calgary, and owned and directed by New York capitalists for the past thirty years, has passed into the hands of prominent Montreal industrialists and financiers. The company has always been the dominating producer in its industry, and operated as a close corporation.

The zinc output of Canada in 1926 was the highest ever recorded, being 74,969 tons, valued at \$11,110,413.

A lead-zinc field has been found west of Big Bunker Hill-Sullivan area, north of Sudbury, Ont. The St. Louis Smelting and Refining Company has a 70% interest in the new find. The field comprises about 2,200 acres.

CALENDAR OF FORTHCOMING EVENTS

- Sept. 2 COKE OVEN MANAGERS' ASSOCIATION. Continental to 12. Tour. (See CHEM. AND IND., August 19, p. 749.)
- Sept. 6 INSTITUTE OF METALS. Autumn Meeting to be held at Derby. (See CHEM. AND IND., August 19, p. 748.)
- Sept. 9. INSTITUTE OF BREWING, Research Fund Committee and Corporate Members. Visit to hop-growing districts in Kent. Luncheon at Canterbury.
- Sept. 12 INTERNATIONAL SOCIETY OF LEATHER TRADES' CHEMISTS. Bi-Annual Conference in London. (See CHEM. AND IND., August 26, p. 768.)
- Sept. 13. SOCIETY OF CHEMICAL INDUSTRY. Official Visit to the Shipping, Engineering and Machinery Exhibition at Olympia, London, W.
- Sept. 14. INSTITUTION OF SANITARY ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.
- Sept. 20. IRON AND STEEL INSTITUTE. *Glasgow Meeting.*
21 & 22. Royal Technical College, Glasgow, commencing each day at 10 a.m. The following papers will be read: (1) "High frequency induction melting," by D. F. Campbell. (2) "Magnetic and other changes concerned in the temper-brittleness of nickel-chromium steels," by H. A. Dickie. (3) "Influence of cold-rolling and subsequent annealing on the hardness of mild steel," by C. A. Edwards and K. Kuwada. (4) "Influence of nickel and silicon on an iron-carbon alloy," by A. B. Everest, T. H. Turner, and D. Hanson. (5) "Effect of varying ash in the coke on blast-furnace working," by C. S. Gill. (6) "Constitution of silicon-carbon-iron alloys, and a new theory of the cast irons," by D. Hanson. (7) "Work-hardening of steel by abrasion," by E. G. Herbert. (8) "On the quantitative measurement of the cutting power of cutlery," by K. Honda and K. Takahasi. (9) "Use of silica gel as a medium for drying blast," by E. H. Lewis. (10) "Mechanism of tempering of steels," by T. Matsushita and K. Nagasawa. (11) "Economic and social development of the American iron and steel industry," by T. W. Robinson. (12) "Behaviour of mild steel under prolonged stress at 300 C.," by W. Rosenhain and D. Hanson. (13) "Testing machine for repeated impact, and a preliminary investigation on the effects of repeated impact on Lowmoor iron," by J. H. Smith and F. V. Warnock. (14) "Solution of carbon in α -iron and its precipitation," by J. H. Whiteley. (15) "Contribution to the theory of the blast-furnace process," by F. Wüst.
- Oct. 5. INSTITUTION OF SANITARY ENGINEERS. Opening Sessional Meeting.

FRANCO-GERMAN TRADE AGREEMENT

The commercial agreement signed by France and Germany on August 17 will have the effect that German goods entering France will, with minor exceptions, be subject to the present minimum tariff. The German goods which are thus affected include "a whole series of chemical products," dye-wood extracts, foodstuffs, etc. Most of the German exports will, however, be subject to the new minimum tariff which will result from the anticipated revision of the French tariff. French goods for which special concessions are granted include various textiles, glassware, iron, steel, copper and so on.

OBITUARY

EMERITUS PROFESSOR H. R. PROCTER, D.Sc., F.R.S.

It is with the deepest regret that we record the death, in his eightieth year, of Henry Richardson Procter, for many years Professor in the Leather Industries Department of the University of Leeds, and an original member of the Society of Chemical Industry. Born on May 3, 1848, at Lowlights, near South Shields, his childhood was spent at the old tannery house amidst pleasant country surroundings until at fourteen he went to Bootham School, York, where, even in those days, his scientific interests were encouraged. After leaving school he was apprenticed to the family business, at which he remained until his father's death in 1888, except for a period of study at the Royal College of Chemistry in Oxford Street. Whilst at the College, Procter acted for a time as research assistant to Frankland and Lockyer in some spectroscopic work, and received, though he did not accept, an invitation to join the eclipse expedition then proceeding to India. Procter always showed a keen interest in astronomy, and was, in fact, author of the article on the "Aurora" in the ninth edition of the *Encyclopædia*.

On his father's death, Lowlights was "tanned out" under Procter's supervision, and the old tannery is now an electricity works. He then joined as chemist the old tanning business of his relatives, Edward and John Richardson, at Elswick, Newcastle-upon-Tyne, remaining there for a year or two, until in 1891 he took charge of the newly-formed Leather Industries Department at the Yorkshire College, Leeds. It was at Leeds that he spent the most fruitful years of his life. His work there did not actually terminate with his official retirement at the age-limit of sixty-five (1913), but continued until about 1922. His last paper of note was on the colour measurement of brown solutions, and was published in the *JOURNAL* in 1923. During the war (1914-1918) Prof. Procter had to resume charge of the Leather Department until Prof. McCandlish came from America to take up the position.

Lately Prof. Procter lived in retirement at Newlyn, Cornwall, near his son and daughter-in-law, Mr. Ernest and Mrs. Dod Procter, the artists, in whose now famous work he took the keenest interest and pleasure. His death came peacefully on August 17, after several months' illness, during long periods of which he was only feebly conscious, if at all.

Prof. Procter's work may be reviewed under: (1) teaching; (2) research; (3) the foundation of the International Society of Leather Trades' Chemists. As a teacher his career began before he came to Leeds, for already in 1885 he published his "Text Book of Tanning," which broke new ground in the endeavour to apply science and particularly chemistry to every part of leather manufacture. When in 1891 the classes at Leeds were begun, Prof. Procter had to make a start with little to guide him save what was learned by a brief visit to tanning schools already open in Austria and Germany. Lecturing, the preparation of the slide collection, formation of the museum, supervision of laboratory and practical work all fell to him, and the early years at Leeds were very busy. The separate building forming the present Leather Department was opened in 1898. As a

teacher, whether in lecture or in his writings, Prof. Procter was always interesting. He had a very remarkable store of miscellaneous information on which he freely drew for illustrations and which was often of great service to his colleagues. Whilst at Leeds he published the "Principles of Leather Manufacture," the "Leather Industries Laboratory Book," and a little work, "The Making of Leather," all written in easy and luminous English and exhibiting a mind of no common order.

In research, Prof. Procter spent much time on tannin analysis, and took much the greatest part in developing the present method, which, considering the indefinite nature of the substances to be estimated, and of the necessary reagent, hide-powder, may be claimed to be a remarkable achievement in empirical analysis. Much more congenial were his long labours on the swelling of gelatin in acids. He early saw that there could be no adequate theory of tanning until gelatin swelling was understood, and from about 1900 to 1916 he gave the best of his energies to this problem. Convinced that the varying and apparently irregular phenomena of swelling could be explained, and reluctant to evade anything by referring to "colloidal" properties, he finally arrived at a quantitative and complete theory involving nothing but orthodox physical chemistry and the properties of elastic solids. The work, of course, has direct application to other proteins, and is one of the most convincing demonstrations that such substances behave in accordance with their chemical structure. During his lifetime Prof. Procter published over one hundred original papers, the first appearing in 1871.

The International Society of Leather Trades' Chemists, which has as its first object the unification throughout the world of methods of tannin analysis, represents the fulfilment of one of Prof. Procter's dearest hopes. Unfortunately, owing to the war, the present unity amongst leather trades' chemists is not what it was in 1913, but progress is again being made, and we shall probably in a few months see one method of tannin analysis in use throughout Europe and America. The expectation of this gave much pleasure latterly to Prof. Procter.

Much could be written about his personal qualities. Kindly and urbane in temperament, free from prejudice on almost every subject, generous in his appreciation of the efforts of others, he endeared himself to all who worked with him. Conversation with him was always interesting and stimulating, and his mental habit of going back every time to first principles brought a freshness into every discussion in which he took part. Sometimes he exhibited a charming and delightful naivete. He once said smilingly to the writer: "I believe that I am open to conviction, and, do you know, very few people are!" This was perfectly true, and one felt that he was impartially surveying himself with the same lucid and easy judgment that he brought to his scientific work.

F. C. T.

The mortar and pestle used by the late Sir Edward Frankland, F.R.S., during his apprenticeship to a druggist in Lancaster has been presented to the Lancaster Museum.

CORRESPONDENCE

THE COLLEGE MAN AND CHEMICAL INDUSTRY

SIR,—The statements made on this subject by various writers in your correspondence columns, during the last two years, may be partly summarised thus:—

(1) The need for closer co-operation between science and industry should remind us that something, more than has hitherto been attempted, must be done to make our graduate and diploma students in chemistry useful to the manufacturer. Failing a scheme of chemical works apprenticeship, similar to that forming part of the training of many engineering students, the best solution would be the establishment of works or technical laboratories in many of the colleges training students to graduate standard.

(2) All those acquainted with the position of chemical industry in England will agree with Mr. F. H. Carr that we develop too much one type of chemist. We have hitherto failed to realise that a link must be furnished between the pure research chemist on the one hand, and the engineer and business man on the other, in the person of the industrial chemist. More than training in pure research, we need training in industrial chemistry, and to this end we need a clear realisation of industrial chemistry as a definite province to which chemistry, engineering and economics contribute in roughly equal shares.

(3) Employers regard graduates as actually unsuitable for works control because they find them impractical. Recognition of the need for training in industrial chemistry as a definite separate branch of science must be our first step, and the provision of suitable colleges the second.

(4) The raw University graduate who has not been taught to think industrially is of little use to his employer until he has had time to readjust his mental values to the hard facts of profit making.

The subject has been reopened by Dr. W. Cullen and Dr. Drake-Law (both having academic and industrial experience), who repeat and amplify many of the above statements.

Mr. F. H. Carr's Streatfeild lecture of 1925, and the discussion following it on this subject, have been printed, read and—perhaps—forgotten; the only school devoted to applied chemistry in London (at Finsbury Technical College) has been closed, and teaching institutions in the London area continue to strive after academic qualifications and honours with unabated vigour.

I agree with Dr. Cullen that the industrialists who know what they require should come out into the open and give a lead to the universities and technical colleges. I also agree that it is impossible to make a start in putting things right unless our leading industrialists speak out in no uncertain tones, and I hope we may now hear the definite views of many of them. If they are not satisfied with the type of man they are now getting from our colleges, they ought to make a serious effort to have our present system of training modified, in some respects, to produce the type of man they require.

I am, Sir, etc.,

ARTHUR J. HALE

Sydenham Avenue, S.E.26

PERSONAL AND OTHER ITEMS

On September 6, the University of Leeds will confer honorary degrees upon Sir Charles Parsons (LL.D.), Dr. J. S. Haldane (D.Sc.), Prof. R. A. Millikan (D.Sc.), and Dr. N. V. Sidgwick (D.Sc.).

Mr. L. H. Sensicle, B.Sc., F.I.C., chief chemist to the Stella Gill Coke and By-products Co., Ltd., has been appointed chief chemist to the Newcastle & Gateshead Gas Co., Ltd., in place of the late Dr. G. Weyman.

Prof. A. E. V. Richardson, director of the Waite Institute, has been appointed the Commonwealth delegate to the Imperial Conference for the co-ordination of agricultural research, which will be held in London next October.

Dr. R. H. Clark, professor of chemistry in the University of British Columbia since 1916, has been appointed head of the Department of Chemistry of that University.

The death is announced at the age of 67 years of Mr. George Edward Wilson, for 15 years a member of the firm of Messrs. Albright & Wilson, chemical manufacturers, of Oldbury. For many years he took a deep interest in the social, industrial, and public life of Worcestershire, and of the Oldbury district in particular. He was an Alderman of the Worcestershire County Council. The funeral at Churchill on Friday last was largely attended. Those present included the following:—Directors of Messrs. Albright & Wilson: Sir Richard Threlfall, K.B.E., Mr. W. B. Threlfall, and Mr. J. Elliott H. Lloyd (who is also secretary to the firm), Mr. C. D. Sykes (general works manager), and Mr. A. A. King (works manager), Mr. P. N. Collyer (chief engineer), and Mr. G. Inglis (research chemist). Mr. W. A. S. Calder (Messrs. Chance & Hunt, Ltd.), also attended.

The late Mr. S. H. Holmes, J.P., chairman of Thomas Holmes & Sons, Ltd., tanners, of Hull, left £167,599, with net personalty £165,331.

Professor Armstrong's Golden Wedding

Professor Henry E. Armstrong, F.R.S., and Mrs. Armstrong celebrated their golden wedding on Tuesday, August 30, and many friends and relations met to greet them at the house in Hampstead of their daughter, Mrs. Stephen Miall. Professor Armstrong is in his eightieth year, and Mrs. Armstrong in her eighty-fifth year, and both of them are active and vigorous. Among those present were their daughters, Mrs. Miall and Miss Nora Armstrong, their sons, Dr. E. F. Armstrong, F.R.S., Dr. R. R. Armstrong, Mr. H. Clifford Armstrong, and Mr. H. L. Armstrong, and a number of grand-children; the scientific guests included Sir William Pope, Sir Richard Gregory, Mr. H. B. Baker, the president of the Chemical Society, Mr. F. H. Carr, the president of the Society of Chemical Industry, Professor W. P. Wynne, Dr. Vargus Eyre, Dr. R. Seligman, Mr. Foster Morley, Mr. E. V. Evans, and Dr. Heller. Prof. Wynne presented an address from old students from many parts of the world, and explained that his old students had purchased the portrait of Prof. Armstrong exhibited at the Royal Academy this year, and given it as a lasting record of their appreciation and affection. Mr. Williams, of the Chemical Industry Club, presented a bouquet from several admiring friends, and the postal authorities had a busy time delivering telegrams of congratulation.

A New Ammonium Nitrate Fertiliser

It is announced that Messrs. Nitram, Ltd., will shortly place a new fertiliser on the market known as "Nitro-chalk," which consists of a mixture of ammonium nitrate and dried Billingham carbonate of lime. The carbonate of lime used comes from the works of Synthetic Ammonia Nitrates, Ltd., and has been much used by farmers for dressing the land. The use of ammonium nitrate alone as a fertiliser has hitherto presented certain difficulties, but in the new form it is perfectly suitable for agricultural use. "Nitro-chalk" will contain about 10% nitrogen, and will, it is expected, be marketed at a price equivalent to that of ammonium sulphate based on the content of nitrogen.

British Gas Industry in 1926

The quantity of gas made in 1926 was 296,082 million cb. ft., and the quantity sold 276,569 million cb. ft. This was 4.3% in excess of that made in 1925, which again exceeded that made in 1924 by 3.1%. The increase in 1926 was due entirely to the increased make of water gas, a rather smaller quantity of coal gas being made in 1926 than in 1925. Only 16,564,000 tons of coal was carbonised in 1926, compared with 17,031,000 tons in the previous year; but 1,436,000 tons of coke for water-gas, and 97,703,000 gals. of oil were used in the later year, as against 1,153,000 tons and 61,383,000 gals. in 1925. In 1926 the residual products included 11,177,000 tons of coke and breeze and 187,546,000 gals. of tar, showing reductions of 221,000 tons and 6,613,000 gals. as compared with 1925. The total number of consumers in 1926 was 8,405,000, an increase of 2.5% over the 1925 total, and their average consumption increased by 2.0%. The number of consumers in 1926 supplied by companies totalled 5,098,000 (about 60%), and the number supplied by local authorities was 3,307,000. The length of gas mains in 1926 was 44,470 miles, an increase of nearly 3% on the length returned for the preceding year.

Specialised Information: A.S.L.I.B. Conference

It is expected that some 200 organisations will be represented at the Fourth Conference of the Association of Special Libraries and Information Bureaux which meets at Trinity College, Cambridge, during the week-end September 23—26. Following a reception by Sir J. J. Thomson, O.M., Master of Trinity, Sir Geoffrey Butler, K.B.E., Senior M.P. for Cambridge University, will deliver the presidential address, whilst among those giving papers are Sir Henry Lyons (Director, The Science Museum), Mr. A. E. Overton (Principal, Board of Trade), and Sir Richard Gregory (Editor of *Nature*). The subjects to be discussed at the Conference include such topics as the recent Report of the Public Libraries Committee, co-operation between libraries, and book selection in science and technology. Sectional meetings will be held on information and statistics in commerce and industry, on patent classification, and on information bureaux questions. The conference is open to all interested, whether members of the association or not. A copy of the detailed programme and other particulars can be obtained from the Secretary, A.S.L.I.B., 38, Bloomsbury Square, London, W.C.1.

With the assistance of the Carnegie United Kingdom Trustees the association is publishing in the autumn

a directory of sources of specialised information, edited by Mr. G. F. Barwick, late Keeper of Printed Books at the British Museum. The book is unique in character inasmuch as it records under thousands of subject headings the various centres in Great Britain and Ireland to which those in search of specialised information should turn.

Asbestos in South Africa

It is stated that Bell's United Asbestos Company, with its subsidiary Bell's Poilite and Everite Company, has decided to erect a new modern plant in South Africa for the manufacture of poilite asbestos cement building materials, both corrugated and tiling, together with plant for the manufacture of asbestos-cement pipes for water mains etc. In view of the heavy tariff on imported asbestos goods, the products should find ready sale.

U.S. Purchase of Cornish Clay Mines

The Papermakers' Importing Co., an American firm which has been long one of the chief purchasers of English china clays, has acquired the Anchor United China Clay Co., Ltd., and the Melingoose China Clay Co., two Cornish firms capable of producing 50,000 tons of china clay a year.

The Interessen-Gemeinschaft

The I.-G. Farbenindustrie has been licensed by the National Lead Company of America to use the company's patents relating to the manufacture of titanium pigments. The sales area will probably be confined to Central Europe.

German Potash Production and Sales

H.M. Consul-General at Cologne (Mr. W. N. Dunn) informs the Department of Overseas Trade that according to figures issued by the Reich Statistical Office and published in the *Deutsche Bergwerks Zeitung* of August 9, the production of potash salts amounted to 94 mill. dz. (1 dz. = 100 kg.), equivalent to 12.6 mill. dz. pure potash. Thus the potash output as compared with 1925 has decreased by 21.9%, but is still considerably higher than in 1924, and comparatively speaking falls little short of 1913. The rationalisation of the potash mining industry is seen from the fact that of the 228 potash works to which a participation figure has been allotted, only 66 participated in the output of 1926 on a monthly average, as against 85 in 1925 and 126 in 1923. Sales of potash salts have decreased from 43.26 mill. dz. (12.25 mill. dz. pure potash) in 1925 to 38.94 mill. dz. (11 mill. dz. pure potash), a decrease of 10%. Of the amounts sold in 1926, 26.35 mill. dz. (6.94 mill. dz. pure potash) was sold on the home market and 12.59 mill. dz. with 4 mill. dz. pure potash abroad. The decrease as compared with 1925 amounted to 11.5% as regards export sales, and 9.5% as regards inland sales.

Activated Charcoal

The source of the note on activated charcoal, which appeared in the issue of August 6, p. 772, was the "Chemical Trade Journal" of August 12, p. 161. We regret that the acknowledgment was inadvertently omitted.

REVIEWS

SPECTROSCOPY. By Prof. E. C. C. Baly, C.B.E., M.Sc., F.R.S. 3rd Edition. In 4 vols. Vol. 2. Pp. vi + 398. Text-books of Physical Chemistry, edited by Sir W. Ramsay and F. G. Donnan, C.B.E., Ph.D., F.R.S. London: Longmans, Green & Co., Ltd., 1927. Price 18s.

It is now three years since the first volume of the new edition of Baly's "Spectroscopy" was published. The advances in spectroscopy have necessitated an extension of the original plan of two volumes to four. Will the first volume be out of date by the time the fourth (or last) volume is published? In fact, like some other recent "text books" in physics, it is neither a text book nor yet a treatise or "handbuch." The price of a book like this is beyond the pocket of the average student. The detail of the exposition is too great in view of the ground the modern student of physics has to cover. For the research worker, on the other hand, such a book can never replace the original sources of his subject.

The present volume contains five chapters. Chapter 1 deals with interference methods, and contains an interesting account of the applications of interferometry to astronomy, such as the determination of the linear diameter of Betelgeuse. Chapter 2 is on methods of illumination. A detailed account is given of King's work on the excitation metallic spectra by the volatilisation of metals.

Chapter 3, on the nature of spectra, reveals the difficulty of being certain about the origin of spectra. It is asserted that "the Swan spectrum . . . is characteristic of carbon monoxide," while in a recent paper Johnson has shown that the emitter is HC-CH. Chapter 4, on fluorescence and phosphorescence, contains an excellent theory of these phenomena by Prof. Baly himself.

The last chapter, the photography of the spectrum, written in conjunction with Dr. Mees, is one of the best in the book, and contains much of value and interest to the practical spectroscopist. W. E. DOWNEY

DEFECTS IN GLASS. By C. J. PEDDLE, M.B.E., D.Sc. Pp. xiv + 205. London: Glass Publications, Ltd., 1927. Price 8s. 6d.

This book is primarily written for producers and workers of glass, but it is likely to be equally valuable to some users of that very interesting material. Most of the commoner and some of the rarer defects are considered in turn, but the book is much more than a mere technical description of defects and of means of preventing and curing them, as in it the author enters at length into the scientific aspects of the subject. He rightly urges that defects should be reported as soon as they occur, and that the origin of the defect must be found before any attempt at a remedy is made, though the latter recommendation is somewhat Utopian. A lengthy classification of defects is given, and the chief ones—lack of homogeneity, striae, cords, bubbles, seeds, stones, and devitrification—are considered in turn, a final chapter dealing with the question of durability.

The few chemists who have long been engaged in the scientific study of the causes of defects in glasses of various kinds and the best means of preventing them will

find little that is really new in this volume, but the much larger number of readers who have had little or no scientific training, but considerable practical experience in the production and use of glass, will find a large amount of valuable information. Amongst others that might be mentioned, is a statement to the effect that "when a portion of a pot or tank breaks away and enters the molten glass, it is not fireclay which is entering, but mullite, a material composed of minute needle-like crystals, which are highly refractory and very difficult to dissolve." This fact, whilst familiar to chemists who manage to keep up to date on the subject, throws a new light to others on the persistency with which minute "stones" remain in molten glass, and indicates the very modern outlook of the author, for this source of mullite was only discovered in 1924.

A very large portion of the volume is occupied by the subject of *devitrification*, in which term the author includes the separation of amorphous solids as well as the more usually recognised crystalline ones; by this means he includes opacity or opalescence under devitrification, and is able to simplify his treatment of the subject. This portion of the book is particularly well written and, notwithstanding the complexity of the subject, it is very clear. Incidentally, when the author states the case for glass being a mixture of compounds and not a single compound, he is not wholly on safe ground, for some of his arguments are equally as applicable to compounds of very low thermal conductivity as to mixtures, and very similar words might be used to show that pure quartz is a mixture!

Most of the illustrations are reproductions from photographs: some are very beautiful, and are invaluable in a careful study of devitrification.

Whilst much remains to be done before a complete account of the defects in glass and of the means of preventing and remedying them can be written, this volume is unquestionably the best introduction to the subject which has yet been published, and can be heartily commended to all who are interested in it.

ALFRED B. SEARLE

AN INTRODUCTION TO PHYSIOLOGICAL CHEMISTRY. By MEYER BODANSKY, Ph.D. Pp. vii + 440. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1927. Price 20s.

Dr. Bodansky's book, written to serve as a student's text-book of physiological chemistry, deserves considerable praise. It is throughout accurate in detail, and, what is equally important, it maintains throughout its whole course a wide outlook on the chemistry of life processes which cannot fail to broaden the student's mind and to make him appreciate that biochemistry is not merely the chemistry of urine and blood.

Of a large number of recent text-books of this type that have been published, this one strikes the reviewer as being outstanding. It deals particularly, as the accepted meaning of its title indicates, with the chemistry of the life processes of the higher animals, but the whole treatment of the subject is vitalised by the wide outlook to which reference has just been made. The book maintains the high standard of the publications of this firm.

J. C. D.

COMPANY NEWS

UNITED TURKEY RED CO., LTD.

An interim dividend has been declared on the ordinary shares of 3% actual, less tax.

WALKERS PARKER & CO., LTD.

It has been decided to close down the company's lead works at Bagillt, in the Halkyn district of North Wales, owing to slackness of trade and foreign competition. These works had yielded no profit since 1890. It was decided to close them some years ago when the Welsh mines were worked down to the water level, but during the war the Government endeavoured to unwater the lead mines in the Halkyn district, but without success. The company will retain the property, and the industry will be transferred to their Chester works, 20 miles away, thus affording considerable economy in working costs.

VEREINIGTE GLANZSTOFF FABRIKEN

The general meeting was held on August 27, when it was decided to increase the capital to 69,000,000 marks by the issue of 60,000 ordinary shares at 300 marks each, and 5,000 preference shares at 60 marks each. Of the new capital 8,400,000 marks are to be offered to the old shareholders at 120 marks per share, the remaining 9,600,000 marks capital to be disposed of to the best advantage of the company.

NUERA-ART SILK CO., LTD.

A statement has been issued by the chairman of this company to the effect that "the final option on the Lilienfeld patents for the manufacture of new artificial silks has been exercised by Messrs. Courtaulds and the Vereinigte Glanzstoff Fabriken A.-G.," and that the Nuera Company now enters upon its rights to manufacture the new silks. Every effort is to be made to start production on a commercial scale at the earliest possible moment, and it is anticipated that the new process will prove a commercial success and greatly enhance the prospects of the company. The patents in question relate to the manufacture of a silk of great tensile strength, and in March, 1926, after careful investigation of the processes, the board decided that a company the size of the Nuera would not be able, unaided, to exploit them to the full advantage. Accordingly, in August of last year steps were taken to interest other companies in the processes, and the company investigated them in co-operation with Courtaulds and the Glanzstoff enterprise.

INTERNATIONAL PAPER CO.

The gross revenue for the half-year ended June 30 last amounted to \$7,071,551 (against \$4,431,662 at June 30, 1926), the net revenue being \$2,407,253 (against \$1,277,216). Dividends on the preferred and common stocks absorbed \$2,231,134 (against \$1,349,109), and \$22,463,949 was carried forward (against \$21,854,114).

LEYLAND AND BIRMINGHAM RUBBER CO., LTD.

A final dividend of 2½% actual, less tax, has been declared, making 5% for the year.

ELLIOTT'S METAL CO., LTD.

A dividend has been recommended of 2s. per share on the ordinary shares, less tax.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 81 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.

Lead Hyposulphite.—9d. per lb.

Lithopone, 30%.—£22 10s. per ton.

Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d.—7d. per lb., carboys extra.

Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.

Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Grey, £15 per ton. Liquor, 9d per gal. 32° Tw.

Charcoal.—£8—£9 per ton according to grade and locality.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liquor.—9d.—10d. 16° Tw. per gal.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 4s.—4s. 1d. per gal., 60% O.P.

Solvent, 4s. 3d. per gal., 40% O.P.

Wood Tar.—£4 10s.—£5 per ton and upwards, according to grade.

Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 4½d.—2s. 8d. per gal.

Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 1½d.—2s. 5d. per gal. Pale, 95%, 2s.—2s. 3d. per gal. Dark, 1s. 9d.—2s. 2d. per gal.

Anthracene Paste.—A quality, 2½d.—3d. per unit, 40%—3d. per unit; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal. Both according to gravity.

Benzole.—Crude 65's, 10d.—10½d. per gal., ex works in tank wagons; Standard motor, 1s. 3d.—1s. 3½d. per gal., ex works in tank wagons; Pure, 1s. 6d.—1s. 7d. per gal., ex works in tank wagons.

Toluole.—90%, 1s. 4d.—1s. 9d. per gal. Pure, 1s. 7d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 2s. 5d. per gal.

Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 9d.—10d. per gal. Heavy, 8½d.—8¾d. per gal. Standard specification, 7½d.—7¾d. per gal. Salty, 7d. per gal., less 1½%.

Naphtha.—Crude, 7½d.—8d. per gal., according to quality. Solvent 90/160, Country, 10½d.—11d. per gal.; London, 1s. 2d.—1s. 4d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, Country, 10d.—11d. per gal.; London, 1s.—1s. 4d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £7 10s. per ton. Whizzed or hot pressed, £8 10s.—£9 per ton.

Naphthalene.—Crystals.—£11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—90s.—95s. per ton, f.o.b. according to district.

Pyridine.—90/140.—5s. 9d.—7s. per gal. 90/180.—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4).—10s. 9d. per lb.

Acid H.—3s. per lb. 100% basis d/d.

Acid Naphthionic.—1s. 6d. per lb. 100% basis d/d.

Acid Neville and Winther.—4s. 9d. per lb. 100% basis d/d.

Acid Sulphanilic.—9d. per lb. 100% basis d/d.

Aniline Oil.—7½d. per lb., naked at works.

Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—4½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb. d/d. Drums extra.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d. 1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline.—1s. 8d. per lb. d/d.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d. 2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt, according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 3d.—1s. 3½d. per lb. Technical 11½d.—1s. per lb.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone.—6s. per lb.
 Benzozaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb. 12 W. Qts.—11½d. per lb.
 Borax B.P.—24s.—27s. per cwt. Powder 26s.—29s. per cwt, according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 2d.—2s. 3d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot.
 Calcium Lactate.—1s. 2d.—1s. 3d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., bulk 2s.—2s. 3d. per gal.; Winchesters, 2s. 11d.—3s. 9d. per gal.; 20 vols., bulk 4s.—4s. 3d. per gal.; Winchesters, 5s.—6s. 6d. per gal.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 9s.—12s. 9d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 6s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonol.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 6d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 100s. per cwt., less 2½% for ton lots.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

per cwt. according to quantity, carr. paid any station in Great Britain in ton lots.

Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignor's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 8½d.—1s. 9½d. per lb. Crystal, 1s. 9½d.—1s. 10½d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
 Sulphonol.—6s. 6d.—6s. 9d. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
 Aubepine (ex Anethole).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzote.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 17s. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. 6d. per lb.
 Ethyl Phthalate.—2s. 9d. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrinol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—18s. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.
 Camphor.—75s. per cwt. Cananga, Java, 26s. per lb. Cassia, 80/85%.—7s. 6d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure.—6s. per lb.
 Eucalyptus, 75/80%.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%, 20s. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 17s. 6d. per lb. Japanese, 8s. 3d. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 10s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Oct. 25th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on September 8th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Fesca, and Fesca & Sohn. Centrifugal separators etc. 21,453. Aug. 15. (Ger., 1.10.26.)

Grönning. Filter. 21,546. Aug. 16.
 Hunt and Wood. Evaporators. 21,435. Aug. 15.
 Johnson (I.-G. Farbenind.). Process of flotation. 21,918. Aug. 19. Driers. 21,985. Aug. 20. Apparatus for separating solid substances of different specific gravity. 21,987. Aug. 20.
 Nes. Manufacture of adsorbing-agents containing silica. 21,803. Aug. 18.
 Ross. Emulsifiers and mixers. 21,617. Aug. 16.
 Saunders. Furnace for drying kilns. 21,939. Aug. 20.
 Siemens A.-G. Purification of gas mixtures. 21,804. Aug. 18. (Austria, 19.8.26.)
 Sterzl. Disintegrating, mixing, etc. materials. 21,926. Aug. 19. (Ger., 20.8.26.)
 Turner. Drying-machines. 21,994. Aug. 20.
 Twiss, and Dunlop Rubber Co. Production of articles from aqueous dispersions. 21,531. Aug. 16.
 Wood. Machinery for grinding, mixing, etc. 21,854. Aug. 19.

I. Complete Specifications

4326 (1926). Marks (Industrial Dryer Corp.). Drying or conditioning. (275,681.)
 9422 (1926). Shell-Mex Ltd., and Lawson. Filters. (275,695.)
 12,691 and 17,508 (1926). Clark. Determining, indicating, and/or controlling moisture-content and quality of materials. (275,741.)
 14,183 (1926). Gröppel, Gröppel, Waschkau, and Scholvien. Settling apparatus for washing granular materials. (253,139.)
 15,598 (1926). Owen. Drying-apparatus. (275,760.)
 17,865 (1926). Elmore. Separation of materials by flotation. (275,778.)
 18,462 (1926). Sweetland. Filters. (275,779.)
 31,421 (1926). Morterud. Evaporation. (263,132.)
 162 (1927). Minter. Kilns. (275,858.)
 3685 (1927). Corlett. Centrifugal separators. (266,693.)
 14,347 (1927). Kehren. Furnaces. (273,671.)
 *19,152 (1927). Appareils et Evaporateurs Kestner. Removal of a substance solidified or condensed on cooling-drums. (275,952.)
 *20,407 (1927). Kohtsch. Separation of solid materials. (275,970.)
 *20,869 (1927). Harter. Apparatus for carrying out exothermic catalytic gas reactions. (275,983.)

II.—Applications

Dewar. Treatment of refractory oils etc. containing sulphur. 21,868. Aug. 19.
 Johnson (I.-G. Farbenind.). 21,918. See V. Purification of montan wax. 21,984. Aug. 20.
 Sanders. Lubricating-oils. 21,837. Aug. 19.
 Siemens A.-G. 21,804. See I.

II.—Complete Specifications

7053 (1926). I.-G. Farbenind. Production of liquid hydrocarbons and derivatives from coal, tar, and the like. (249,155.)
 12,293 (1926). Patart. Regeneration of contact masses for the catalytic hydrogenation of carbon oxides. (252,361.)
 17,865 (1926). Elmore. See I.
 32,189 (1926). Halden. Low-temperature carbonisation. (263,197.)
 32,223 (1926). Duchemin. Gas scrubber. (263,794.)
 5857 (1927). Inray (Allgem. Ges. f. Chem. Ind.). Continuous treatment of hydrocarbons. (275,884.)
 12,795 (1927). Still. Coke ovens. (275,914.)
 14,334 (1927). Chilowsky. Manufacturing gas from heavy oils. (271,899.)
 *7598 (1927). Rütgerswerke A.-G., and Kahl. Production of labile bitumen emulsions. (275,928.)
 *21,181 (1927). I.-G. Farbenind. Destructive hydrogenation of carbonaceous materials. (276,001.)

*21,203 (1927). Florentin, Kling, and Matignon. Obtaining light hydrocarbons from oxygenated organic compounds. (276,007.)

III.—Application

Carpmael (I.-G. Farbenind.). Manufacture of *o*- and *p*-xylene. 21,995. Aug. 20.

III.—Complete Specifications

7053 (1926). I.-G. Farbenind. See II.

15,039 (1926). I.-G. Farbenind. Cyclic hydrocarbons and derivatives thereof. (253,911.)

5857 (1927). Imray (Allgem. Ges. f. Chem. Ind.). See II.

IV. Applications

• Carpmael (I.-G. Farbenind.). Manufacture of green vat dyestuffs. 21,710. Aug. 17.

Geigy A. G. Manufacture of leuco-compounds of vat dyestuffs. 21,440. Aug. 15. (Ger., 16.8.26.)

Gubelmann, Stallmann, and Weiland. 1-Amino 2, 4-dichloroanthraquinone. 21,501. Aug. 15.

I.-G. Farbenind. Manufacture of azo-dyestuffs. 21,892. Aug. 19. (Ger., 19.8.26.)

Johnson (I.-G. Farbenind.). Manufacture of finely-divided azo colouring-matter etc. 21,790. Aug. 18.

Newport Co. Preparation of para-hydroxy-ortho-benzoylbenzoic acid. 21,496. Aug. 15. (U.S., 29.11.26.)

IV.—Complete Specifications

11,815 (1926). I.-G. Farbenind. Manufacture of vat-dyestuffs. (251,996.)

12,282 (1926). Carpmael (I.-G. Farbenind.). Manufacture of azine dyestuffs and intermediates. (275,724.)

12,284 (1926). I.-G. Farbenind. Manufacture of azo dyestuffs. (252,182.)

13,223 (1926). I.-G. Farbenind. Manufacture of vat dyestuffs. (260,910.)

15,039 (1926). I.-G. Farbenind. See III.

20,212 (1926). Newport Co. Preparing nitro-amino-benzoyl-*o*-benzoic acid and its derivatives. (265,545.)

29,163 (1926). I.-G. Farbenind. Manufacture of cyclohexylamines. (261,764.)

*6308 (1927). I.-G. Farbenind. Manufacture of benzanthrone derivatives. (275,927.)

*16,487 (1927). I.-G. Farbenind. Manufacture of coloured compounds. (275,943.)

*21,203 (1927). Florentin, Kling, and Matignon. See

*21,440 (1927). Geigy A.-G. Preparations of leuco-compounds of vat dyestuffs. (276,023.)

V.—Applications

British Celanese, Ltd., Ellis, and Olpin. Treatment of cellulose derivatives. 21,680. Aug. 17.

Carpmael (I.-G. Farbenind.). Degreasing raw wool. 21,996. Aug. 20.

Henkel et Cie Ges. Washing textile fabrics. 21,610. I. Aug. 16. (Ger., 17.8.26.) Detergent compositions. 21,612. Aug. 16. (Ger., 17.8.26.)

I.-G. Farbenind. Opening up materials containing cellulose. 21,442. Aug. 15. (Ger., 13.8.26.)

Leao. Extraction of cellulose from vegetable products. 21,491. Aug. 15.

V.—Complete Specification

*21,442 (1927). I.-G. Farbenind. Opening up materials containing cellulose. (276,025.)

VI.—Applications

Brazier, and Macintosh & Co. Rollers for dyeing, printing, etc. 21,740. Aug. 18.

British Celanese, Ltd., Ellis, and Olpin. Coloration of materials. 21,567. Aug. 16.

Carpmael (I.-G. Farbenind.). Dyeing acetate silk. 21,820. Aug. 18.

Heberlein & Co. Treatment of fabrics. 21,891. Aug. 19. (Ger., 19.8.26.)

VI.—Complete Specifications

13,403 (1926). British Alizarine Co., Ltd., Dawson, Soutar, and Wood. Dyeing of cellulose ester artificial silk (275,752.)

29,488 (1926). Heberlein & Co. Chemically varying vegetable and artificial fibre. (261,793.)

7124 (1927). King. Dressing of textile materials. (275,891.)

VII.—Applications

Azogino Soc. Anon., Tanzi, and Toniolo. Manufacture of non-hygroscopic double salt from calcium nitrate. 21,826. Aug. 18. (Italy, 19.8.26.)

Carpmael (I.-G. Farbenind.). Electrolysis of brine. 21,626. Aug. 16.

Husain and Partington. Process for production of pseudo-perphosphates. 21,962. Aug. 20.

Johnson (I.-G. Farbenind.). Manufacture of ammonia. 21,919. Aug. 19. Production of hydrogen peroxide. 21,986. Aug. 20.

Nes. 21,803. See I.

Petersen. Manufacture of sulphuric acid. 21,439. Aug. 15. (Ger., 28.8.26.)

Robson. Manufacture of sulphate of ammonia. 21,623. Aug. 16.

VII.—Complete Specifications

16,704 (1926). Deutsche Gold- u. Silber-Scheideanstalt. Stabilising hydrocyanic acid. (254,747.)

1885 (1927). Tardun. Manufacture of lead monoxide. (265,190.)

*16,761 (1927). I.-G. Farbenind. Production of anhydrous metal chlorides. (275,945.)

*21,046 (1927). Chem. Fabr. Grossweissandl, and Leidler. Preparing large salammone crystals. (275,991.)

*21,209 (1927). Grothe, and Metallhütte Magdeburg. Treating copper- and zinc-containing lyes. (276,008.)

*21,346 (1927). I. G. Farbenind. Recovery of copper from liquors by precipitation. (276,017.)

VIII.—Applications

British Hartford-Fairmont Synd., and Wardley. Furnaces for treating glassware etc. 21,604. Aug. 16.

Dunn. Pottery kiln etc. 21,746. Aug. 18.

VIII.—Complete Specifications.

25,000 (1926). Rhenania-Kunheim Verein Chem. Fabr. Manufacture of glass containing barium. (259,953.)

*21,343 (1927). United States Metals Refining Co. Magnesite refractories. (276,016.)

IX.—Applications.

Marks (Internat. Precipitation Co.). Manufacture of waterproof plastic Portland cement etc. 21,469. Aug. 15.

Minache. Building material. 21,989. Aug. 20.

Nuttall and Schellings. Building-materials. 21,397. Aug. 15.

IX.—Complete Specifications

19,390 (1926). Schoenhoefer. Producing a plastic material capable of setting and hardening. (275,788.)

9354 (1926). Chem. Fabr. Grunau, Landshoff & Meyer, and Kirchner. Accelerating setting of hydraulic binding-agents. (275,897.)

X.—Applications

Goldsmith and Jackson. Manufacture of metal powders 21,770. Aug. 18.

Hornsey. Treatment of iron ores or oxides. 21,830. Aug. 18.

Johnson (I.-G. Farbenind.). 21,918. See I.

Metals Production, Ltd., and Taplin. Heat treatment of oxidised copper ores. 21,922. Aug. 19.

Wagner. Treatment of oxidised ores etc. 21,494. Aug. 15.

X.—Complete Specifications

3866 (1926). Michel. Protection of magnesium and its alloys. (249,484.)

12,129 (1926). Gustafsson. Producing metals in electric furnaces. (252,162.)

13,227 (1926). General Plate Co. Alloys containing gold. (257,891.)

17,865 (1926). Elmore. *See* I.

19,004 (1926). Hatfield and Green. Treatment of stainless or rustless steels or irons. (275,781.)

19,716 (1926). Crist. Metallising ores and recovery of metals and by-products. (275,791.)

26,903 (1926). Sprenger Patentverwertung Jirotko, and Jirotko. Producing metal coatings on aluminum and aluminium alloys. (275,828.)

1055 (1927). Metallbank u. Metallurgische Ges. Purifying aluminium and its alloys. (265,563.)

4516 (1927). Polanyi and Bogdandy. Apparatus for determining the composition of copper and zinc alloys. (268,306.)

*20,920 (1927). I.-G. Farbenind. Magnesium alloys for pistons of internal-combustion engines. (275,985.)

*21,260 (1927). Schrobsdorff. Producing alloys of very refractory carbides. (276,011.)

*21,346 (1927). I.-G. Farbenind. *See* VII.

XI.—Applications

Asahi Garasu Kabushiki Kaisha, and Ohta. 21,636. *See* XIII.

Barralet, and Damard Lacquer Co. Manufacture of insulation materials. 21,665. Aug. 17.

Carpmael (I.-G. Farbenind.). 21,626. *See* VII.

Internat. General Electric Co., Inc. High-frequency induction furnaces. 21,884. Aug. 19. (Ger., 19,8,26.)

XI.—Complete Specifications

12,129 (1926). Gustafsson. *See* X.

19,266 (1926). Allan. Electrolytic apparatus. (275,785.)

27,620 (1926). Oldham & Son, Ltd., and Clarke. Galvanic batteries. (275,832.)

*19,726 (1927). Lahousse. Composition for electrical insulation or impregnation. (275,958.)

XII.—Application

Akt. Separator. Recovering oil from fatty solutions of proteins etc. in water. 21,809. Aug. 18. (Sweden, 8,9,26.)

XIII.—Applications

Asahi Garasu Kabushiki Kaisha, and Ohta. Producing insulating varnish. 21,636. Aug. 17.

Taylor. Anti-corrosive paint etc. 21,652. Aug. 17.

XIII.—Complete Specifications

12,289 (1926). Light. *See* XX.

24,063 (1926). Becker, and Siemens & Halske A.-G. Manufacture of drying varnishes. (275,813.)

1983 (1927). Hercules Powder Co. Manufacture of high-grade rosins. (275,862.)

*19,692 (1927). British Thomson-Houston Co. Coating materials. (275,955.)

*19,726 (1927). Lahousse. *See* XI.

*20,352 (1927). I.-G. Farbenind. Colouring lacquers. (275,969.)

*21,113 (1927). Soc. Chem. Ind. in Basle. *See* XX.

XIV.—Applications

Brazier, Hurlston, and Macintosh & Co. Manufacture of transparent etc. rubber. 21,843. Aug. 19.

Twiss, and Dunlop Rubber Co. 21,531. *See* I.

XV.—Complete Specification

*21,305 (1927). Geigy A.-G. Preparing mineral-acid-free synthetic tanning-agents. (276,014.)

XVI.—Application

I.-G. Farbenind. Fungicide. 21,597. Aug. 16. (Ger., 16,8,26.)

XVI.—Complete Specifications

20,058 (1926). Liljenroth. Producing a mixed manure containing phosphoric acid and nitrogen. (275,843.)

*21,597 (1927). I.-G. Farbenind. Fungicide. (276,033.)

XVII.—Applications

Henkel et Cie, Ges. Halogen-calcium starch preparations. 21,613. Aug. 16. (Ger., 17,8,26.)

Marks (Corn Products Refining Co.). Purifying sugar. 21,404. Aug. 15. Manufacture of dextrose. 21,465. Aug. 15.

Manufacture of crystalline dextrose. 21,903. Aug. 19. Manufacture of dextrin. 21,904. Aug. 19.

Nes. Purification of liquids containing sugar. 21,802. Aug. 18.

White (Ackers, Lonsdale & Co., and Lonsdale). Treatment of sacchariferous etc. material. 21,828. Aug. 18.

XIX.—Applications

Akt. Separator. 21,809. *See* XII.

Pharmagans Pharm. Institut L. W. Gans. Manufacture of phosphatides. 21,706. Aug. 17. (Ger., 16,2,27.)

XX.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of basic ethers of resorcinol. 21,819. Aug. 18.

Chem. Fabr. vorm. Schering, and Jordan. Manufacture of alkylisoalkylenephenols etc. 21,485. Aug. 15.

Henry, Sharp, and Wellcome Foundation. Preparation of therapeutic substances. 21,544. Aug. 16.

I.-G. Farbenind. Manufacture of anti-serum for treatment of scarlet fever. 21,441. Aug. 15. (Ger., 14,8,26.)

Imperial Chemical Industries, Ltd., and Mendoza. Manufacture of pyrazolones etc. 21,912. Aug. 19.

Pharmagans Pharm. Institut L. W. Gans. 21,706. *See* XIX.

XX.—Complete Specifications

12,289 (1926). Light. Production of aldehyde-amine condensation products. (275,725.)

*21,113 (1927). Soc. Chem. Ind. in Basle. Manufacture of condensation products from formaldehyde and thiourea, or a mixture of thiourea and urea. (275,995.)

*21,203 (1927). Florentin, Kling, and Matignon. *See* IV.

*21,221 (1927). Chem. Fabr. vorm. Schering. Manufacture of thymol, its isomers or homologues, and their hydrogenation products. (276,010.)

*21,300 (1927). I.-G. Farbenind. Manufacture of 1-amino-3-dialkylamino-2-propanols. (276,012.)

*21,441 (1927). I.-G. Farbenind. Manufacture of an anti-serum for prevention or treatment of scarlet fever. (276,024.)

XXI.—Applications

Hermer. Photographic fixing process. 21,630. Aug. 17.

I.-G. Farbenind. Production of photographic films. 21,598. Aug. 16. (Ger., 16,10,26.)

XXI.—Complete Specifications

16,357 (1926). Rieder. Sensitised coatings and processes for photo-etching. (275,763.)

*11,980 (1927). I.-G. Farbenind. Manufacture of photographic plates or films. (275,933.)

*21,360 (1927). Marconi's Wireless Telegraph Co., Ltd. Heat-sensitive recording-papers etc. (276,020.)

XXIII.—Complete Specification

9097 (1926). Sauer. Production of gases for combating vermin. (260,274.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—

Algeria: Coal, coke, briquettes, coal tar, lime, cement, fertilisers for vines and cereals (169). *Belgium*: Beeswax, paraffin wax, tallow (158). *British India*: Chemicals, drugs, medicines, perfumery, culinary essences (152); artificial silk yarn, paper (153); Portland cement, steel solid drawn tubes, cast-iron wheels (The Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E. 1). *Germany*: Heavy and fine chemicals except cresols and phenols (162). *Hungary*: Caustic soda (167). *New Zealand*: Copper tubes and sheets (156); compression testing machine (A.X. 5097). *South Africa*: Insulators (B.3736); steel rivets (B. 3740). *Turkey*: Porcelain insulators (B.X. 3734).

First-Aid Materials

The Chief Inspector of Factories gives notice that by Order dated June 27 the Home Secretary has prescribed that, as from October 1, all materials for dressings contained in the first-aid boxes or cupboards which are required to be provided in pursuance of Section 29 (1) of the Workmen's Compensation Act, 1923, or Regulation 4 (a) of the Docks Regulations, 1925, or Regulation 47 of the Building Regulations, 1926, shall be those designated in, and of a grade or quality not lower than, the standards prescribed by the British Pharmaceutical Codex, 1923.

News from Advertisements

The Appointments Board of the Imperial College of Science and Technology announces particulars of its service (p. vi).

An experienced shorthand typist is required as secretary to a chemist (p. vi).

The University of London, University College, announces particulars of the Ramsay Laboratory of Chemical Engineering (p. vi).

The City of Cardiff Education Committee announces particulars of its courses and open scholarships (p. vi).

An old-established chemical business is for sale (p. vi).

A chemical laboratory assistant is required by the Experimental Department of the Fine Cotton Spinners' and Doublers' Association (p. vi).

A highly-trained chemist requires a junior partnership in a chemical concern (p. vi).

There are 113 firms represented under various headings in our Buyers' Guide.

No. 36

EDITORIAL

Co-ordination Compounds

THE newspapers have, with considerable unanimity, complained that the presidential addresses and other papers read at the British Association are not intelligible to the ordinary reader, nor even to the trained and well-educated scientific reporter, and that the British Association, as a medium for making science known to the public, suffers in consequence. We think this is undoubtedly true, and that the complaint is well justified. The British Association was formerly important as a means of interesting the public in science and instructing it in some of those controversial topics which in former days attracted so much attention. It is, in spite of some efforts to maintain a certain degree of popularity, no longer such a means. There are reasons for this change, and it may be worth while to state some of them. Fifty or seventy years ago there were highly controversial sections of geology, zoology, botany, and chemistry, the main outlines of which could be understood by those who had only a rudimentary knowledge of these subjects. Many of these sections have been well investigated and explained; the points of doubt and argument now left involve a considerable acquaintance with the subject. In the middle of the last century an amateur could make useful contributions to most sciences except mathematics; no deep knowledge was necessary to appreciate the discoveries of Murchison, Sedgwick, Faraday, Mendel, Boyd Dawkins, Darwin, and Lubbock. All that elementary work, or almost all, has been done; a lengthy training in mineralogy and a well-equipped laboratory are necessary to the modern geologist; the biologist has become a specialist; the modern chemist must not only have an active brain, a good memory and nimble fingers, he must know the essential foundations of physical chemistry, thermodynamics, and an immense mass of organic and inorganic chemistry, much of which is highly technical and difficult. The new work in chemistry which is of fundamental importance, for instance, the conceptions of valency, co-ordination, ionisation and optical activity, can be

put in simple language and made intelligible to many people, but this is, as we know, a laborious business. You can hardly expect the busy man of science, of eminence sufficient to justify his choice as an exponent at the British Association, to spend the time necessary to paraphrase his discourse so as to make it suitable for general consumption; it is hard for the chemist to write so that he is intelligible to all chemists, harder still for him to write so that he is intelligible to the botanist and the engineer. The popular exposition of chemistry is, in our opinion, worth doing, and not very difficult to do, but it is a tedious business involving a great expenditure of time. It is not work for the professor who is capable of original research; his time is too precious for that. Neither the professor nor the student preparing for his examinations can afford the time for this work. If we consider such a subject as co-ordination compounds, we recognise that Dr. Sidgwick has made this plainer to us than any writer whom we recollect; that it is not entirely easy for us to follow is partly due to the complexity of the subject, and partly to the imperfection of our education. We have no right to expect Dr. Sidgwick to do more for us. In the old Daltonian or Cambrian epoch the combination of atoms was easy to understand, and it sufficed to explain all that was known. When Faraday introduced the ion to us, this was no difficulty and no complication. Organic chemistry introduced to us fresh examples of chemical combination, and gradually many types of chemical combination have become known which fit neither the old beliefs nor the old phraseology. Such combination as occurs in alum, in many hydrates, in alloys, solid and liquid solutions, colloids, co-ordination compounds, crystals and so on, is all capable of explanation in terms of nuclei and electrons, and of the electrical attractions between these; you may explain the cohesion of crystals of lithium chloride in terms of atoms or of ions, but you are bound, if you do so, to explain in what sense you use these terms. Our old phraseology is being strained to include new conceptions, and it is a slow business and

involves a good deal of study to learn exactly what meaning should be attached to covalency, polar bodies, ions and so forth, and to explain to the curious public the meaning of co-ordination without employing ambiguous or unintelligible terms. Let anyone try and explain the elements of crystal structure or aqueous solution in simple English, and the magnitude of the task becomes apparent. It is merely the magnitude which is troublesome; it is not a difficult business; anyone with enough brains to solve a cross-word puzzle could do it, but you get very little assistance from the average textbook. It takes a student at a university only a little time to learn the current views on these theoretical points from the professors; it is extremely difficult to learn them from the printed page. We are very grateful to Dr. Sidgwick for placing at the disposal of the chemical public so lucid and careful an account as he has done. Some day the whole gamut of chemical combination from the mere mechanical mixture of alum— if that is a mixture and not a compound, as to which we are uncertain—right down to hydrochloric acid, will be explained to us in simple terms; meanwhile, we are thankful for what we have got. We have a few crystals of copper sulphate on our table, and are ready to listen to anyone who will explain these to us without bringing in the terms "atom" or "ion," neither of which helps us very much. We do not care greatly whether the mortar belongs to this brick or that, or is shared between them, or lent by one to the other, but we should like to know how the pieces fit in to each other and how they stick together.

Human Physiology

Dr. C. G. Douglas, the President of the Physiology Section of the British Association, makes a plea for the further study of human physiology, and points out how much we have yet to learn of the natural causes which regulate the chemistry and the mechanism of the human body. An old writer tells us that ignorance of natural causes disposeth a man to credulity, and credulity, because men love to be hearkened unto in company, disposeth them to lying; so that ignorance itself without malice is able to make a man both to believe lies and tell them. The study of natural causes has thus a moral side as well as a profound effect on our health and well-being. We wish that some chemist would invent a new word for hydrogen ion concentration, for these three words, two of them Greek in origin and one Latin, require a couple of dozen letters and are in very frequent use. It seems that the h. io. con. is the property in the blood which regulates the respiration and circulation in the blood, and Dr. Douglas explains how the addition of acid or its excretion, and the addition of alkali or its excretion, alter the h. io. con. so that this is physiologically and qualitatively nearly equivalent to acidity. The respiratory centre of the brain is sensitive to the h. io. con., and when an excess of acid, usually carbonic acid, in the blood is caused, the brain promptly starts the lungs to work, jams its foot hard on the accelerator as it were, and at the same time increases the speed of the circulation of the oxygenated blood; further analogies will at once occur to everyone who has ever driven a motor-car. We judge from

Dr. Douglas's address that ordinary red blood is chemically a convenient liquid for the storage and release of either oxygen or carbonic acid, and we think it would not be difficult to write much of very little value on the occurrence of red blood in the animal kingdom, with cursory remarks on the exceptional cases of its occurrence in insects, and so on. The human combustion chamber is so elastic that it can enable the lungs to attain a maximum efficiency twenty times as great as the normal minimum. We hope in due course to have a full report of the discussion on hormones and their effect on digestion; meanwhile our curiosity has been excited by an account in *The Times* of the work of Miss Boas, at the Lister Institute, on the poisonous character of the dried white of egg, and how the evil may be averted by potato starch or arrowroot. Eggs, we have heard, may produce asthma, but whether eggs neutralised by potato starch are equally injurious in that respect we know not. *The Times* goes on to explain that physiologically bread should not be eaten without butter, nor porridge without milk. Fortunately, *The Times* has at last acquired a reputation for respectability; otherwise some people might have called it flippant to touch lightly on such cereal topics.

The Empire Mining Congress

The Empire Mining and Metallurgical Congress is held every three years, and this year was held in Montreal in the latter part of August. Great Britain, the senior partner in the Empire firm, was represented by the Rt. Hon. Sir Robert Horne, whose metallurgical activities in connexion with the base metals are very considerable, by Sir Thomas Holland, Sir Richard Redmayne, and others. It was very appropriate that the congress should be held in Canada, for Canada is highly mineralised, and is able to contribute enormous quantities of many metals for the consumption of the Empire. The Empire can supply its own gold, silver, tin, nickel, lead and zinc, and the main supply of the world's nickel comes from Canada, while most other metals are produced there in greater or less quantity. The congress, so we judge from a kind correspondent, was sumptuously entertained in Quebec, Montreal, Ottawa, and Toronto, and several valuable papers were read, including one on magnesia refractories, one on Portland cement, one on smelting titaniferous iron ores, and one on the utilisation of brown coal. The discussions included the consideration of coal and petroleum, and dealt with the mineral resources and methods of production of Canada, Australia, South Africa, and India, as well as other parts of the Empire. We hope at an early date to be able to publish an abstract of many of the more important papers. Such congresses are very pleasant, and they may also be very valuable; we do not now know to what extent nickel, cobalt, chromium, zinc, and certain other metals may become essential in particular industries a few years hence; titanium was once a mere curiosity, aluminium hardly much more. We shall be wise to place on record the production of our Empire mineral resources and the possibilities of further production; the time will come when the demand for metals will increase largely and the convenient sources of supply be much diminished.

CO-ORDINATION COMPOUNDS*

By N. V. SIDGWICK, O.B.E., Sc.D., F.R.S.

When the British Association last met in Leeds, 37 years ago, the attention of Section B was largely devoted to the discussion of ionisation, and at a joint meeting with Section A the new theory of Arrhenius was defended by van 't Hoff and Ostwald against the attacks of S. U. Pickering and Prof. H. E. Armstrong. That meeting may be taken as marking the recognition in this country of the distinction between ionised and non-ionised linkages. It seems appropriate, therefore, that I should devote this address to the discussion of a third species or sub-species of atomic linkage, that of co-ordination.

The theory of co-ordination is indeed by no means new: it is only a few years younger than that of electrolytic dissociation; but its interpretation, and especially the establishment of its relation to the older theory of structural chemistry, have only become possible through the advance made in our knowledge of atomic structure in the last few years: and there are still many points in which its bearing on questions of general chemistry is not yet fully realised.

Werner's theory of co-ordination, which was first put forward in 1891, originated in an attempt to explain the structure of certain compounds formed by apparently saturated molecules with one another. A large number of such compounds, often very stable, had been observed, but they were commonly disregarded by chemists, or were shelved under the convenient name of molecular compounds; and such attempts as had been made to formulate them on the lines of structural chemistry had been conspicuously unsuccessful. The most marked peculiarities of these compounds were three. In the first place their structure appeared to be quite independent of the ordinary rules of valency, according to which the numerical value of the valency of an atom element was primarily determined by the group in the periodic table to which it belonged, first rising and then falling by single units as we go from one group to the next. In these compounds the structure was rather determined by the tendency of four or six atoms or groups to arrange themselves round a central atom. Secondly, in these complexes, a univalent atom or group of atoms such as chlorine or NO_2 could be replaced by a whole apparently saturated molecule such as water or ammonia without affecting the stability of the complex. Thirdly, such replacement was always accompanied by a remarkable change in the ionisation of the molecule. Thus, platinum chloride PtCl_4 combines with six molecules of ammonia forming a compound $\text{Pt}(\text{NH}_3)_6\text{Cl}_4$, in which all four chlorine atoms are ionised. As the ammonia molecules are removed one by one, the chlorine atoms appear to take their places in the non-ionised part of the molecule, until we reach $\text{Pt}(\text{NH}_3)_2\text{Cl}_4$, which is not ionised at all, and is not a salt: every replacement diminishes the positive charge on the platinum complex by one. If more ammonia molecules are replaced by chlorine atoms, the ionisation occurs again, but now the complex has acquired a negative charge, so that we finally reach the well-known "double salt" K_2PtCl_6 .

To explain these phenomena, Werner proposed a theory of molecular structure founded on entirely new principles: that it was determined by the tendency of atoms, irrespective of the periodic groups to which they belonged, to attach to themselves a definite number (usually six, sometimes four, and less often other numbers) of other atoms or groups, which might either be univalent radicals or whole molecules capable of independent existence. These groups together with the central atom formed the "co-ordination complex" and the groups were said to occupy the "first sphere" of combination of the central atom; the molecule might also contain other atoms or groups occupying a "second sphere," which were less firmly attached, and did not count as part of the co-ordination complex. For example, in the hexammine of platinum chloride $[\text{Pt}(\text{NH}_3)_6]\text{Cl}_4$, the ammonia molecules were regarded as occupying the first sphere of the platinum and satisfying its co-ordination number 6, while the chlorine atoms occupied the second sphere. Experimentally the groups in the second sphere were distinguished by the fact that they were ionised in water, while those forming part of the co-ordination complex were not. Werner produced a great mass of evidence in support of these views; the chemical public in general did not, however, pay much attention to them until in 1911 Werner showed that certain compounds of chromium and other elements which, on his theory, should have asymmetric molecules could actually be resolved into their optically active forms. It then became evident that the theory must at least contain a large element of truth.

Thus, some fifteen years ago, Werner had been able to demonstrate that his theory accounted for the structure of a large number of (mainly inorganic) compounds, with which the ordinary structural theory was not able to deal. He himself applied the theory to organic compounds as well: he regarded it as a general theory of molecular constitution, and sought to show that the structural theory failed even in dealing with organic compounds. But this must be admitted to be the weakest part of his argument: he was not really able to prove that the structural theory was inadequate in the sphere of its greatest triumphs, that of organic chemistry.

An impartial critic writing at this time (say, in 1913) might have summed up the position thus: The theory of structural chemistry gives a satisfactory account of the molecular constitution of nearly all organic and a certain number of inorganic compounds, but it is unable to deal with a large number of substances of the latter class. The theory of co-ordination, which proceeds on wholly different lines, is able to explain the structure of those compounds with which the former theory breaks down: it can account for their composition, their properties, their isomerism, and even their stereoisomerism. There thus appear to be two different modes of chemical combination, each holding within its own sphere, but neither applicable to the whole of chemistry. This was obviously a most unsatisfactory position, and one which could only be temporary. It was clear that the true theory of molecular structure when it was discovered must be one which would apply to all compounds, both organic and inorganic, and that

* Presidential Address to Section B—Chemistry, of the British Association, delivered at Leeds on September 1.

the two rival theories, that of structural chemistry and that of co-ordination, must ultimately prove to be two partial aspects of the same general phenomenon.

The final solution of the problem was scarcely to be expected until a more definite idea had been reached of the physical mechanism of atomic linkage, and this could only be attained when more was known of the structure of the atom. The discovery of the electron as a universal constituent of all forms of matter had suggested that it was in this that the mechanism of valency was to be sought; but a further development of our knowledge of the electronic arrangement was necessary before it could be applied in detail to answer the questions asked by the chemist. This development was reached, in the years from 1911 onwards, mainly through the work of Rutherford, Bohr, and Moseley. Through their researches we learnt that the atom consists of a positive nucleus surrounded by groups of electrons, and that each successive element in the periodic table contains one more unit of positive charge on its nucleus than the one before it, and one more planetary electron: the atomic number being at once the ordinal number of the element in the periodic table, the number of units of positive charge on the nucleus, and the number of surrounding electrons. The conceptions of the nuclear atom and of atomic number may be said to give us the empirical formula of the atom. The next stage, the determination of the structural formula, of the way in which the surrounding atoms are arranged, although it is not yet complete, has been so far developed by means of the Bohr theory and its subsequent modifications, that we are now in a position to apply the physical results to the solution of the purely chemical problems of valency and molecular structure.

It is evident that the cause of chemical combination is the striving of atoms to attain more stable arrangements of their planetary electrons by some kind of redistribution. The inert gases, since they do not enter into chemical combination, must already possess an arrangement too stable to be capable of improvement; their atomic numbers therefore give us the sizes of a series of completed or stable groups, and it may be expected that when other atoms combine to form a molecule, they thereby attain these numbers of electrons, or something like them.

The application of these ideas in detail to the explanation of valency was primarily due to Kossel and G. N. Lewis, who published their views almost simultaneously, in 1916. Kossel dealt with ionised links, and showed that their structure could be explained by supposing that they were due to the migration of one or more electrons from an atom which had a few more than a stable (inert gas) number, to another which had a few less; hence the valency in ionised compounds was usually equal to the number of places by which an element was removed from an inert gas, and was positive if it came after the inert gas, and negative if it came before. The more difficult problem of the non-ionised link, such as we find in elementary chlorine or hydrogen, or in methane, was explained by Lewis by the assumption that it is possible for two atoms, each of which is a few electrons short of a stable number, to share electrons in such a way that each counts as part of the constitution of each

atom, thus forming a link which is not merely due to electrostatic attraction, and so cannot be ionised.

These views of the two fundamental kinds of linkage—ionised and non-ionised, polar and non-polar, or, as Langmuir has conveniently called them, electrovalent and covalent—that one is due to the transference and the other to the sharing of electrons between two atoms, has been confirmed by all subsequent discoveries, and may be taken to be generally accepted. The atomic models on which both Kossel and Lewis founded their theories have indeed been shown to be impossible. These authors supposed that the electrons surrounding the nucleus were at rest, and Lewis in particular assigned to them definite positions in his famous cube, which was subsequently developed in so much detail by Langmuir. We now know that any such static hypothesis is untenable; it involves the assumption of a variety of otherwise unknown forces, and it is incapable of explaining many of the properties of atoms, especially their spectra; whereas all these are accounted for by a dynamic model, in which the electrons move in orbits round the nucleus much as the planets move round the sun. But the conceptions of the transference and the sharing of electrons can equally well be applied to the dynamic model of Bohr.

So far the mechanism of valency at which we have arrived is that of structural chemistry rather than that of co-ordination. The numerical value of the valency of an atom appears equal to the excess or defect of its electrons as compared with the stable number of an inert gas. If it has, say, two electrons in excess, loosely attached and forming an imperfect group, it can lose them and become a divalent cation, or it can share them and so form two covalent links: if it has two electrons less than the stable number it can take up two from another atom or atoms and become a divalent anion, or it can share two electrons belonging to other atoms and become di-covalent; if the excess or defect is two, the valency, of whichever kind, is two also. The next element, with an excess or defect of one, will have a valency of one. We thus arrive at the relation between the valency of an element and its group in the periodic table which was originally pointed out by Mendeléeff. In fact the majority of the structural formulae of organic chemistry can be translated into electronic formulae by the simple process of writing two dots (for two shared electrons) in place of a line. It is important to notice the reason for the two dots—for Lewis's assumption that two shared electrons are necessary for every covalency. The most familiar property of valency, which has been recognised from the earliest times, is that if one atom combines with another it not only uses up one of its own units of combining power, but one of those of the other atom as well. Where the link is ionised, the reason of this is obvious: the electron which one atom loses must be taken up by the other. But the same must hold with covalency also. If the covalent link consisted of a single shared electron, this would not be true. If the atom A could form a covalent link with B merely by sharing one of its own electrons with B, this would use up one of the units of B, since it would increase B's electrons by one; but it would not affect the combining power of A. For example, hydrogen (1) is one

electron short of the stable helium number 2; carbon (6) is 4 short of the stable neon number 10. If in methane (CH_4) each hydrogen atom is attached to the carbon by a single shared electron, then if this electron is derived from the hydrogen it will satisfy the carbon, but will leave the hydrogen still one electron short; if it is derived from the carbon, it will leave the carbon four electrons short of the stable number. In either case the resulting molecule would be unsaturated, whereas it is in fact saturated. It was to meet this difficulty that Lewis assumed that the covalent link consisted of two shared electrons, one derived from each of the two linked atoms. On this hypothesis the carbon in methane shares one of its four valency electrons with each of the four hydrogen atoms, thus increasing the number of each hydrogen to two, and at the same time each hydrogen shares its own electron with the carbon, thus satisfying the carbon.

We have therefore got an electronic mechanism which will account for the two recognised forms of valency, the ionised and the non-ionised. If these are really the only two forms of linkage which can exist in a molecule, it must be possible to extend them so as to account for co-ordination. This is in fact surprisingly simple, and the solution was foreshadowed by Lewis in his paper of 1916. It is clear that the link which attaches one of the groups of a co-ordination complex to the central atom is of the non-polar type. It is an essential point in Werner's theory that such links are not ionised; this is how they are distinguished from the links to atoms in the "second sphere." Thus in the compound $[\text{Pt}(\text{NH}_3)_4\text{Cl}_2]\text{Cl}_2$ the two chlorine atoms outside the bracket enclosing the co-ordination complex are ionised, while those inside are not. The same conclusion is supported by the fact that the arrangement of the groups in the co-ordination complex round the central atom can give rise to optical activity; for this, as we know from organic chemistry, is only possible with groups which are attached by covalent links, that is, by directed forces. We must therefore look for an explanation of co-ordination in the formation of covalencies, that is, of links formed of pairs of shared electrons. But they must arise in some way different from that which we have hitherto assumed, since their numerical relations are different; their number is not related to the periodic group of the central atom, and also they can be formed with atoms (such as the nitrogen in ammonia or the oxygen in water) which have already completed a stable number of electrons. Now in the normal covalency formation described above it was assumed that one of the two shared electrons of a link came from each of the two atoms concerned. It is obviously possible that both might be derived from one of them; and the recognition of this possibility is all that is required to provide an electronic mechanism for co-ordination. By means of this extension of the idea of covalency formation we can explain all the peculiarities of co-ordination compounds, of which, as we have seen, the most important are the power of further combination shown by apparently saturated molecules such as water and ammonia, the attainment of a valency limit (the co-ordination number) independent of the periodic group to which the atom belongs, and the peculiar change of

electrovalency which accompanies the replacement of a univalent radical such as chlorine by a whole molecule such as ammonia. We may consider these in turn. In nitrogen there are five valency electrons; by combination with three hydrogen atoms this number is increased to eight, giving a molecule of ammonia, in which the octet of the nitrogen is complete and the atom is so far saturated. But, though complete, the octet is not fully utilised: six of its members are shared with the three hydrogen atoms, but the other two are unshared, and so can form a fourth link if another atom can be found which will share them without sharing some of its own electrons with the nitrogen in return. This may happen in a variety of ways. A hydrogen ion, consisting of a single proton with no attendant electron, is capable of taking up two electrons, and, as we all know, if a hydrogen ion meets an ammonia molecule it combines with it to form an ammonium ion

The nitrogen has now shared all its eight valency electrons, two with each of the four hydrogen atoms; but since the ammonia molecule is electrically neutral, while the hydrogen ion is positively charged, the resulting NH_4^+ molecule is also positively charged. Again, boron has three valency electrons; it can share one of them with each of three chlorine atoms (thus completing the octets of the chlorines), and at the same time take a share in one of the electrons belonging to each of the chlorines. This gives boron trichloride BCl_3 , in which the boron has increased its valency group from three to six. The boron cannot combine with a fourth chlorine atom, because, although its own octet is not complete, it has no more unshared valency electrons to offer for a covalent link. But if it meets an ammonia molecule it can share the unshared pair of electrons of the nitrogen, and so form a co-ordinate link:—

In this way each of the two atoms assumes a covalency (or, if we prefer to call it so, a co-ordination number) of four.

The conditions for the formation of a co-ordinate link thus are that we should have one atom which has a pair of unshared valency electrons to offer, and another which has room for one or more pairs of electrons in its valency group. It is convenient to have a symbol and a nomenclature to express this process, and I have therefore suggested that, while the ordinary covalent link is represented by a line $\text{A}-\text{B}$, the co-ordinate link should be written as an arrow $\text{A} \rightarrow \text{B}$, pointing away from the atom which contributes the two electrons of the link; also we may call the atom which lends the electrons (A) the donor, and that which receives them (B) the acceptor.

We have now to apply these ideas to the compounds on which Werner based his theory. Any simple cation—that is, an atom stripped of its valency electrons—can

act as an acceptor. It can build up a valency group by sharing electrons belonging to other atoms, that is, by forming co-ordinate links. Thus the chromic ion $[\text{Cr}]^{+++}$ contains a stable core of twenty-one electrons, and has no valency group; the stability of this arrangement is proved by the stability of the chromic salts. This ion can then form a series of co-ordinate links with molecules of ammonia, by sharing the "lone pair" of electrons of the nitrogen atom. Since the stable size of the valency group for such an ion is 12, six molecules of ammonia will be taken up, and in this way the hexammine $[\text{Cr}(\text{NH}_3)_6]^{+++}$ is produced. We have thus accounted for the power which certain complete molecules possess of combining further through co-ordination.

The next point is to explain the peculiar change of electrovalency which accompanies the replacement of an ammonia molecule by, say, a chlorine atom. It is natural that if an ammonia molecule is removed, this should be replaced by another covalently linked atom, because that is required to maintain the valency group of 12. When the ammonia is removed it takes away with it the two shared electrons which it originally contributed; the chlorine atom which replaces it supplies one electron to be shared by the chromium, but the chromium is called upon to supply the other electron for the link. Thus the chromium is one electron short of its stable number, and must take up an electron from elsewhere to make up the deficiency. In other words the replacement of the ammonia by chlorine will reduce the positive charge on the ion by one unit, giving instead of $[\text{Cr}(\text{NH}_3)_6]^{+++}$ the ion $[\text{Cr}(\text{NH}_3)_5\text{Cl}]^{++}$, or the salt $[\text{Cr}(\text{NH}_3)_5\text{Cl}]\text{Cl}_2$. The same change will occur for every replacement of a whole molecule in the complex by a univalent radical. Thus the very peculiar change of electrovalency which Werner established is a necessary result of the electronic mechanism underlying the linkage. The third important characteristic of the co-ordination compounds is the co-ordination number itself. As we have seen, the most remarkable point about these compounds is that the relation observed in ordinary structural chemistry between the valency of an element and its group in the periodic table disappears. Instead of finding that the valency—the number of links which an atom can form—increases from one in the first group to four in the fourth, and then falls (in the simpler compounds at any rate) to one in the seventh, we find that the co-ordination number is independent of the periodic group, and is usually either six or four. But this again follows necessarily from the theory. So long as the valency is expressed by ionisation, or by normal covalencies to which each atom contributes one electron, it must be limited either by the number of electrons which the atom has to offer, or by the number for which it has room in its valency group; it will therefore be determined by the distance of the atom in question from the nearest inert gas, or, in other words, by the group in the periodic table to which it belongs. In its saturated compounds the atom will usually be left either with an imperfect valency group (like the boron in boron trichloride) or with one which is incompletely shared, like the nitrogen in ammonia. Where co-ordination occurs this limitation is removed;

the atom can give or take as many electrons as may be necessary, and in the fully co-ordinated atom it will have a fully shared valency group. Its maximum co-ordination valency, or co-ordination number, is, therefore, half the number of electrons in its maximum valency group.

In this way the conception of the co-ordinate link as being a covalency, that is, a link of two shared electrons, differing from the ordinary covalency only in this, that the two electrons both come from one of the linked atoms instead of one from each, provides the mechanism required to explain the existence and the properties of the co-ordination compounds of Werner. This conclusion removes the apparent contradiction between organic and inorganic compounds; it refers the structure of molecules of both classes to the same physical principles, and exhibits the original co-ordination theory of Werner and the older structural theory as two aspects of the same general process. It further removes two objections which might have been urged against the co-ordination theory as it was originally proposed. The first of these is that it seemed to assign a unique position to one or two of the atoms in a molecule, which were regarded as "co-ordination centres" in some way governing the structure of the whole. This is obviously an incorrect view of the molecule, in which every atom is in a sense as important as every other. We can now see that this is in fact the case, and that the nitrogen in an ammine, for example, is just as much a centre of co-ordination as the metal. The second point is that the distinction which Werner made between principal and subsidiary valencies, which was always unsatisfactory, now disappears. It originated in a desire to retain the valencies of the structural theory, while recognising the formation of more links than the structural theory would permit. It has long been clear that there was no ground for maintaining the existence of this distinction within the co-ordination complex. The electronic theory shows that the difference between a normal and a co-ordinate covalency is in their method of formation; when they have been formed both alike consist of two shared electrons.

The further application of these ideas to those compounds with which Werner's name is most closely connected is an inquiry of great interest, but I do not propose to pursue it here. I would rather consider some more general questions. We have been led, in seeking an explanation of the structure of co-ordination compounds, to the conception of a third form of atomic linkage in addition to the recognised forms of electrovalencies and covalencies; or, as we should rather say, we have found that a covalency can arise in a second way. This new method is peculiar in that it allows of the combination of apparently saturated atoms or molecules with one another, and it is therefore the condition which makes the association of liquids possible. Links of this type are not confined to inorganic compounds, but are widely spread in organic chemistry, as Werner himself showed. Co-ordination is thus of great importance throughout the whole of chemistry. Now that we understand the physical mechanism which underlies it, we may hope to arrive at some idea of its characteristic properties, and it will be well

to consider what new light these throw on various problems of chemistry in general.

We have already seen that the formation of a co-ordinate link involves the presence of one atom which can act as a donor and another which can act as an acceptor. The donor must have a pair of unshared valency electrons. The acceptor must have fewer valency electrons than it is capable of holding. This raises the question of the maximum size of the valency group. If we maintain the original octet theory, that the valency group cannot exceed eight, and at the same time hold that every covalency involves two shared electrons, it follows that the maximum covalency cannot exceed four. The existence of stable compounds such as sulphur hexafluoride shows that this conclusion is false, and hence that one or other of the two assumptions must be abandoned. Some chemists maintain the octet limit, and explain the existence of atoms with a covalency greater than four by assuming the possibility of a covalent link formed of a single shared electron: they suppose, for example, that in sulphur hexafluoride the sulphur has eight shared electrons, and that two of the fluorine atoms are attached by two electrons each, and the other four by one each. This view seems to me to be untenable. There must be some relation between the mechanism of a link and its behaviour; if not it is of little use to discuss the mechanism. Links of single electrons undoubtedly occur in a limited number of compounds of hydrogen, such as $[\text{H}_2]^+$ and the hydrides of boron (B_2H_6 etc.); but, as we should expect, they are always very unstable. I cannot believe that a substance like sulphur hexafluoride, which is one of the most stable of known compounds, and can be heated to a red heat with sodium without decomposition, can contain four such links. I should therefore abandon the limit of eight for the valency group (as G. N. Lewis has now done), and adhere to the view that in all but a few unstable compounds every covalency involves two shared electrons. On these principles the maximum size of the valency group is twice the covalency or co-ordination maximum. An examination of the structures of known compounds gives strong reason to believe that there is a direct and simple relation between the maximum covalency (co-ordination number) of an atom and its position in the periodic table, and that this depends not on the periodic group, but on the period in which it occurs, so that the co-ordination classification runs horizontally, while the normal valency values run vertically. It would take too long to discuss the evidence for this statement, but I may give the conclusions. The maximum covalency of hydrogen is 2: that of elements in the first short period (lithium to fluorine) is 4: that of elements in the second short period (sodium to chlorine) and the first long period (potassium to bromine) is 6: and that of the later elements is 8. The maximum number of electrons in the valency group is, of course, twice as great, being 4, 8, 12, and 16, respectively. No physical reason for these facts can as yet be given, but a certain relation can be traced between the numbers and those of the grouplets of the Bohr theory as modified by Stoner and Main Smith.

The next question is the difference in properties which is

to be expected between the normal and co-ordinate covalencies. These are essentially of two kinds. In the first place the co-ordinate links are in general less stable. The stability of a link depends on the work required to break it, or, in other words, on the difference of energy content between the original molecule and the products of the rupture of the link. Hence, the more unstable these products are, the more difficult it is to break the link. The rupture of a normal covalency leads to the production of two univalent radicals

that is, of two highly unstable products. But a co-ordinate link can break by the return of the two shared electrons to the atom to which they originally belonged

and one at least of the products is now a molecule capable of independent existence. Thus, the products of the rupture of a co-ordinate link are, as a rule, more stable than those formed by breaking a normal covalency, and the co-ordinate link is therefore less stable. This difference is particularly marked in rings containing co-ordinate links, those which Prof. Morgan has called chelate rings: these are far more sensitive to strain, owing to the weakness of the co-ordinate link, than the ordinary rings of organic chemistry; while the latter are known of every size from 3 to 18 members, chelate rings almost invariably contain either 6 or 5; a few 4-rings are known, and one or two 7- and 8-rings; but none with less than 4 or more than 8 members. This explanation of the difference in strength between normal and co-ordinate links is of considerable importance; the fact is beyond dispute, and if we are to maintain that the mechanism of both forms of linkage is the same, consisting in the sharing of two electrons, we must be able to give a reason for this difference in stability.

The second point of difference is that while the normal covalency involves no considerable disturbance of the electrostatic equilibrium in the molecule, this is not true of the co-ordinate link. In the normal link between two atoms, each atom shares one electron with the other atom. If the electrons were shared equally between the two, there would be no electrostatic disturbance at all. We do not know enough about the dynamics of the sharing of electrons to say how nearly this is true, but the properties of ordinary covalent compounds indicate that it is not far from the truth, and that the shared electron usually divides its time more or less equally between the two atoms which share it. But when a co-ordinate link is formed between two originally neutral atoms, one of them loses and the other gains a share in two electrons. Hence, the acceptor must receive a negative charge from the link and the donor a positive charge. This fact is expressed by some chemists, such

as Prof. Lowry, by writing the link $\overset{+}{\text{A}}-\overset{-}{\text{B}}$ instead of $\text{A} \rightarrow \text{B}$. A molecule containing such a link is therefore an electrical dipole. This electrostatic disturbance will have two chief results: it will increase the dielectric constant of the substance, and it will increase the attraction of the molecules for one another, and therefore diminish the volatility. That this does actually

occur we have plenty of evidence; I may give a few examples, selected from non-associated substances, in order to avoid the complications which association might produce. While the value of the dielectric constant for hydrocarbons is about 2—3, for ethers about 4, and for esters about 7 (all these being free from co-ordinate links), it is greatly increased by the introduction of a nitro-group

which contains this link, and is for nitromethane 39 and for nitrobenzene 36. The effect on the boiling point is seen by comparing the alkyl nitrites $\text{R}-\text{O}-\text{N}=\text{O}$ with the isomeric nitro-compounds

the latter boil from 50° to 100° higher than the former. Many other examples might be quoted.

These examples suggest the consideration of associated liquids. As long as we were at liberty to invent new kinds of subsidiary valencies, the existence of association caused no trouble. But now that we claim to have discovered the mechanism of atomic combination, we must identify the link between the molecules of an associated substance with one or other of the forms of link that we have recognised, and it is evident that the co-ordinate link is the form required. We ought, therefore, to be able to find in every associated substance a donor and an acceptor atom. Such atoms are always found to be present: in the most familiar class of associated compounds, those containing hydroxyl groups, the oxygen atom of this group, with its two pairs of unshared valency electrons, is the donor, and the hydrogen atom, being able as we have seen to increase its valency group from two to four, is the acceptor. We thus get the possibility of an indefinite degree of polymerisation:—

That the association does depend on the two atoms of the hydroxyl group is shown by the fact that if we replace either the oxygen by sulphur or the hydrogen by an alkyl group the association disappears: neither the mercaptans nor the ethers are associated. Associated substances possess the properties which we have seen to accompany the co-ordinate link, the high dielectric constant and the low volatility. The latter property is commonly taken to be sufficiently explained by the rise of molecular weight which the association produces, but unless this is much greater than we have any reason to suppose, it will not account for the whole effect. For example, the ethers boil about 60° lower than the corresponding thio-ethers; hydrogen sulphide boils at -61°, and so unimolecular H_2O should boil about -120°. If the real formula of water is H_4O_3 (and it is very improbable that its average polymerisation is even as great as this at 100°), its true molecular weight is not 18, but 54. This will account for a rise in the boiling

point, but not for so large a rise as is actually found. Hydrogen selenide (mol. wt. 81.2) boils at -42°, and butane (mol. wt. 58) at +1°. Evidently the polymerised molecules themselves are much less volatile than corresponds to their molecular weights, as we should expect from the presence of the co-ordinate link. The high values of the dielectric constant (water, formamide, and hydrogen peroxide about 80, methyl alcohol 35, ethyl alcohol 27) are further evidence of co-ordination. This reference to the dielectric constant raises a point which is worth mentioning, although I cannot discuss it in detail here. In some modern developments of the theory of organic reactions great stress is laid on the dipole moment of such groups as hydroxyl. The values of these moments are calculated from the dielectric constants of the hydroxylic compounds, and are assumed to apply to the single unassociated molecules. Now, since we have seen that the association itself must increase the dielectric constant owing to the co-ordination of the molecules with one another, it is by no means certain that values so obtained hold good for the unpolymerised hydroxyl group. It is, of course, quite possible that the same conditions which make the hydroxyl group so ready to polymerise also give it a high dipole moment even in the simple molecule; but the rise in the dielectric constant which the association itself must produce is a factor which must be taken into account, especially as it is one which will vary with the temperature.

This view that association is due to co-ordination throws light on the behaviour of a group of substances whose position was hitherto rather puzzling. There are many substances, such as sulphur dioxide, ethers, and amines, which behave in many ways like associated liquids, and yet when they are directly tested are found not to be associated; they are volatile, and give simple values of the molecular weight in the pure state and in non-associated solvents. It has long been a problem how such substances should be classified. It is now clear that they contain only one of the two elements necessary to co-ordination: they have donor atoms (oxygen or nitrogen), but no acceptor atoms (the acceptor properties of hydrogen attached to nitrogen are for some reason very weak). They are thus incapable of polymerisation, and in the presence of non-associated liquids they behave as normal non-associated substances. But in the presence of a substance capable of association, and so containing acceptor as well as donor atoms, they behave as associated substances.

These considerations emphasise a very important and far-reaching characteristic of the co-ordinate link, its one-sided nature. The two atoms taking part in it perform quite different functions; and in determining the structure of a co-ordination compound it is essential to show which of the two co-ordinated atoms is the donor and which the acceptor. This distinguishes the electronic view of co-ordination from the subsidiary valency theory of Werner and his school; there was no apparent reason why two atoms which could form subsidiary valencies with a third atom should not also form them with one another. We can see now that such a linkage is impossible; there must be the necessary opposition in character between the two atoms before

co-ordination can take place. It is true that Werner himself was saved by his almost uncanny insight into molecular structure from falling into this error, but there was nothing in his theory to save him from it, and not all his followers had as true an intuition as he had himself. The recognition of this distinction, to which the electronic interpretation directly leads, is a definite advance.

Among the more important developments of the theory of co-ordination which must be expected in the near future, its systematic application to organic chemistry must take a high place, for it is by the study of organic compounds that we really can examine in minute detail the influence of structure on properties. The very existence of organic chemistry—the fact that the compounds of carbon form a group at least as numerous and important as all other chemical compounds together—can only be fully explained by reference to the theory of co-ordination. Werner pointed out long ago that the unique position of carbon was due to the fact that its valency and its co-ordination number were identical. This we should now express by saying that as it has four valency electrons it can obtain a fully shared octet by normal covalency formation and without the production of co-ordinate links. But this is not all. Since carbon is in the first short period of the table, this octet is incapable of further expansion. Hence the ordinary saturated quadrivalent carbon atom is incapable of acting either as an acceptor or as a donor, and for this reason it is peculiarly well protected from the attack of other atoms. This is undoubtedly the chief cause of the remarkable sluggishness ("trägeit," as Victor Meyer called it) so characteristic of carbon, a disinclination to react which gives comparative stability to a large number of thermodynamically unstable compounds. That this explanation is sound may be seen by comparing the behaviour of the halides of carbon with that of the halides of neighbouring elements. Most non-metallic halides are readily hydrolysed by water, and we may assume that the hydrolysis is preceded by a combination (through the formation of co-ordinate links) of the water with the halide. In boron trichloride, for example, the incomplete octet of the boron completes itself by sharing a pair of electrons from the oxygen of the water, forming the compound

analogous to the ammonia compound discussed above. A hydrogen and a chlorine atom then separate as hydrochloric acid, leaving a hydroxyl group attached to the boron, and by the repetition of this process the hydrolysis to boric acid is completed. The same reaction occurs with silicon tetrachloride, because, although the silicon has already a complete octet, it can expand this to a group of 12, since it is in the second period. With nitrogen the position is not quite the same. In the trichloride NCl_3 the octet of the nitrogen is complete, and it is incapable of expansion; but it is not fully shared, and contains a lone pair of electrons. Hence, though it cannot be an acceptor, it can be a donor. It

forms a co-ordinate link not with the oxygen, but with the hydrogen of the water, giving

The chlorine then reacts with the hydroxyl, forming hypochlorous acid, while the hydrogen remains attached to the nitrogen, the ultimate product being ammonia. The truth of this hypothesis of intermediate co-ordination with the water is strongly supported by the fact that it explains the unusual production of hypochlorous acid from chlorine attached to trivalent nitrogen.

But carbon tetrachloride cannot react in either of these ways. It has a complete octet, and cannot increase it, and the octet is fully shared, so that it cannot act as a donor. It therefore does not react at all. The remarkable inactivity of carbon tetrachloride has long been regarded as an unexplained anomaly, but we can now see that it is a necessary consequence of the theory of co-ordination. If we want to find a similarly inactive halide of an element in a later period, where a valency group of 12 is possible, we must obviously choose one in which this group of 12 is fully shared and also is incapable of further expansion. Examples of this are the hexafluorides of sulphur and selenium, whose inactivity is as remarkable as that of their carbon analogue. Tellurium hexafluoride on the other hand is hydrolysed by water, since its valency group of 12 can expand to 16, and the tellurium can therefore (like silicon in the tetrahalide) act as an acceptor.

Now the carbon atoms in an ordinary saturated organic compound all resemble that in the tetrahalide in having fully shared valency groups of the maximum size. They are therefore incapable of the most obvious form of reactivity, which begins by co-ordination with a reagent molecule: if they are to react at all, it must be through some other atom in the molecule. It is a significant fact that one of the most elementary rules of organic chemistry is that a carbon atom united only to other carbon atoms or to hydrogen or the halogens is very slow to react, but that the introduction of a single oxygen atom into the molecule facilitates reaction. The comparison of the paraffins with the ethers or alcohols, of the ethers with the esters and the esters with the acid anhydrides, or of the alkyl halides with the acyl halides, illustrates the effect which an oxygen atom may have on the stability of a molecule. It seems natural to relate this effect to the strong donor properties which oxygen exhibits, and to suppose, for example, that the rapid hydrolysis of an acyl halide is due to the formation through the oxygen of a compound

in which the hydrogen of the water is brought into close proximity with the chlorine, while the relative inactivity of an alkyl halide is the result of its inability to form such a compound.

I make these suggestions (which might easily be extended) because it seems to me that in the intensive modern study of the influence of structure on the

reactivity of organic compounds this side of the question has been too much neglected. Great attention has been devoted to the consideration of the effect of other atoms in the molecule on the strength of a particular linkage. A new mechanism and a new terminology—or perhaps more than one—have been invented to account for the results. This mechanism is described in terms of physical concepts, and although it appears to me that the properties which are assigned to these concepts need considerable modification before they can be accepted by the physicist, there is no doubt that this mechanism enables its inventors to correlate a large number of important generalisations, so that some real truth must underlie it, although we may at present be in some doubt as to what that truth exactly is. But I think these chemists have tended to rely too much on supposed modifications of the linkages within the molecule, and have not sufficiently considered the possibility of the formation of co-ordination compounds with the reagents employed, such as those which I have suggested above. The effect of one atom in a molecule in hastening the replacement of another may not be due merely to a weakening of the attachment of the latter, but may be caused by the formation of a co-ordinate link through the former, or this may promote co-ordination through some other atom in the molecule. We know now that even in purely “organic” compounds—quite apart from those organo-metallic compounds which the old-fashioned organic chemist regarded with so much distaste—co-ordination is of frequent occurrence. In the particular form of the production of chelate rings, that is, in the form of co-ordination between two atoms of the same molecule, it has been shown to occur in β -diketones and β -ketoesters, in many ortho-substituted phenols, and in α -keto-oximes, and to be responsible for much of the chemical as well as the physical peculiarities of these substances; and in the more general form of association or “molecular compound” formation its occurrence is widespread. Formerly the production of such compounds was ascribed to some inferior and rather contemptible form of valency, possibly to a force acting not between atoms at all, but between whole molecules, and so the influence of their formation on what were regarded as the reactions of genuine valencies was naturally taken little into account. But we now realise that they owe their existence to the production of co-ordinate links, and that the co-ordinate link is in essence the same as a normal covalency. The co-ordinated hydrogen, for example, as in

is attached to each of the two oxygen atoms by means of two shared electrons. The link on one side is just as genuine as that on the other, although, owing to the difference in the states of the two oxygen atoms, one of them may separate more easily. It therefore seems probable that the formation of such a link may often be a preliminary stage to the complete transference of the hydrogen from one point of attachment to another, and that the possibility of its formation may be a necessary condition of reaction. We have further to recognise

another way in which reaction may be promoted by co-ordination, which is illustrated by the example I gave of the hydrolysis of an acid chloride. The formation of a co-ordination compound between two molecules may bring two atoms into proximity with one another, and so favour their reaction. In developing this possibility we have to consider the stereochemical relations. The study of chelate rings has shown us what forms of ring are most stable; owing to the weakness of the co-ordinate link which they contain such rings afford, as I have already pointed out, a more delicate test of strain than the ordinary rings of organic chemistry. Thus we find that a chelate ring of six atoms, including double links, is formed with peculiar ease. From this we may conclude that when a chain of atoms is formed by co-ordination which includes one or two double links, the sixth atom of this chain will be able to approach the first very closely, and so may be expected to react with it. In these and other ways the consideration of possible intermediate co-ordination products may provide the clue to many organic reactions.

If this line of thought is to be pursued, there is a preliminary question which requires investigation. We have seen that two conditions are essential to the formation of a co-ordinate link, the presence of an atom with an unshared pair of valency electrons (the donor), and of another (the acceptor) which can add two electrons to its valency group. But these conditions, though necessary, are not sufficient. They are both fulfilled in most organic molecules other than those of hydrocarbons. The normal hydrogen atom has only two electrons, and it can hold four: every halogen atom, every oxygen atom, every trivalent nitrogen atom has an unshared pair of valency electrons; and yet halides, ethers, and amines are not as a rule associated. For co-ordination to take place it is necessary not only that such atoms should be present, but also that they should be so linked that they are able to exercise their donor or acceptor properties. Hydrogen, for example, is a powerful acceptor when it is joined to oxygen or fluorine: it is a weak acceptor when it is joined to nitrogen; it is practically not an acceptor at all when it is combined with carbon or one of the heavier halogens. We cannot at present explain these differences in behaviour, but it is quite easy to show that they exist. In the same way the donor properties of oxygen are very largely influenced by its state of combination. If the influence of co-ordination on reactivity in organic compounds is to be studied in detail, the first necessity is a knowledge of the factors which promote co-ordination itself, and this can only be attained by a careful examination of the facts from this point of view; a thorough investigation of the influence of substitution on the tendency of molecules of a particular type to associate with themselves, or to form addition compounds with other substances, would no doubt throw much light on the question. It would be particularly interesting to know what is the effect on activity, both in donors and in acceptors, of the peculiar tendencies to reaction which the modern organic chemist represents by positive and negative signs.

I have tried in these remarks to emphasise the fact

that the modern electronic interpretation of the theory of co-ordination has a value far outside the range of those compounds which the theory was originally devised to explain. There is too great a tendency even now to regard the question of co-ordination as one which is of interest only in connection with a highly special group of substances which the ordinary chemist rarely meets, whereas in truth the study of this question has given us a wider and a truer conception of the nature of the processes by which molecules are built up. The determination of the factors which influence chemical reaction is perhaps the most important of the fundamental problems of chemistry, and it is essential that the factor of co-ordination, with the new possibilities of reaction-mechanism which it opens up, should be recognised and investigated.

CANADIAN INDUSTRIAL NOTES

The salt production of Canada for 1926 was 262,547 tons, an increase of 12 per cent., and the value of output \$1,480,149. The average price, for all grades, showed a decline from \$6.04 in 1925 per ton to \$5.63 in 1926. The imports of salt amounted to 188,401 tons, valued at \$1,036,594.

The Canadian Explosives, Ltd., which is closely affiliated with Nobel's Industries, Ltd., Great Britain, and a holding company for the following six operating concerns Canadian Explosives, Ltd., Canadian Giant Company, Ltd., Dominion Cartridge Company, Ltd., Canadian Fabrikoid, Ltd., Flint Paint and Varnish, Ltd., and Arlington Company of Canada, has changed its corporate title to Canadian Industries, Ltd. Holders of Canadian Explosives common stock will receive six shares of the new company's stock for one share of the old, giving the company an issued common capital 649,950 of no par value shares. There will also be outstanding \$4,650,000 of preferred stock similar to that of the old company.

The Standard Chemical Co., Ltd., of Canada, engaged in the manufacture of acetates, methyl alcohol, acetone, charcoal, etc., has submitted to the shareholders the details of a proposed capital reorganisation. The authorised capital of the company is \$5,000,000, divided into 37,500 shares of 7% cumulative preference stock of total par value of \$3,750,000, of which \$3,602,700 is outstanding; 12,500 shares of common stock of total par value of \$1,250,000, all issued. The arrears of dividends on preference shares cover a period of thirteen years. The reorganisation proposal is to have only one class of stock, of no par value, and each holder of the present preference shares will receive one of the new, and each holder of ten shares of the present common will receive one share of the new issue. Within the past few years the company has closed and dismantled works at Sault Ste Marie, Thornbury, Cookshire, Weedon and Donald because of inability economically to operate them, partly due to exhaustion of wood supply and market conditions of the products. Considerable stock in the company is held in Britain.

The Canadian Salt Co., Ltd., is replacing its old Grainer plant, at Sandwich, Ontario. A new and completely modern plant will be erected at a cost of about \$150,000.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICE

CHEMICAL SOCIETY'S LIBRARY

The library of the Chemical Society is closed each evening at 5 o'clock until September 10.

CALENDAR OF FORTHCOMING EVENTS

Sept. 12 to 14.—INTERNATIONAL SOCIETY OF LEATHER TRADERS' CHEMISTS. Bi-Annual Conference in London. (See CHEM AND IND., August 26, p. 768.)

Sept. 13.—SOCIETY OF CHEMICAL INDUSTRY. Official Visit to the Shipping, Engineering and Machinery Exhibition at Olympia, London, W.

Sept. 14.—INSTITUTION OF SANITARY ENGINEERS. Visit to the Shipping, Engineering and Machinery Exhibition at Olympia.

Sept. 20, 21, and 22. IRON AND STEEL INSTITUTE. *Glasgow Meeting.* Royal Technical College, Glasgow, commencing each day at 10 a.m. (See CHEM. AND IND., Sept. 2, p. 786.)

Sept. 23 to 26.—ASSOCIATION OF SPECIAL LIBRARIES AND INFORMATION BUREAUX. Fourth Conference, Trinity College, Cambridge. Amongst the papers to be read are the following:—"The necessity for uniformity in the cataloguing of periodicals," discussion to be introduced by Dr. W. Bonser, Mr. J. F. Pownall, and Miss H. A. Ball. "Recent developments in connexion with the science library, South Kensington," by Col. Sir H. G. Lyons. Brief statements will be given on the work of the International Institute of Intellectual Co-operation (Paris), the International Institute of Bibliography (Brussels), the World List of Scientific Periodicals, etc. "Rationalisation in industry," by Major L. Urwick. "Forecasting of industrial and trade tendencies; the function of statistics in modern industrial organisation," by (a) H. Quigley and (b) W. Wallace. "Trade information and statistics in Great Britain as compared with other countries," by A. E. Overton. Papers dealing with patent classification, and the methods of searching patent specifications in Great Britain, Germany, and the United States, will be given. "Information bureaux and liaison with national and local libraries," by A. F. Ridley. "Special library from the administrative standpoint, with special reference to methods of indexing and filing," by P. K. Turner. "Information bureau in relation to the consultant," by Dr. J. C. Withers. Discussion on "New methods of photographic reproduction as applied to printed and MS. material." A panel of expert translators; discussion to be introduced by Dr. R. S. Hutton. "Standards of book selection in science and technology," by Sir Richard Gregory, followed by a discussion. (See CHEM. AND IND., Sept. 2, p. 788.)

Sept. 26 and 27.—CERAMIC SOCIETY. *Refractory Materials Section Meeting.* Town Hall, Bournemouth, commencing at 10 a.m. each day. The following papers will be read:—"A consideration of steel works refractories," by A. T. Green. "Note on silica bricks made without added bond," by W. J. Rees and W. Hugill. "Some experiments in the drying of clays," by R. S. Troop. "Crushing strength of unfired fire-clay bodies," by W. C. Hancock. "Determination of iron silicates," by A. E. J. Vickers. "Refractory material used as mortar for laying up refractories," by Prof. D. A. Moulton. "Characterisation of clay," by Dr. A. F. Joseph. Discussion to be opened by S. R. Hind. "Effects of temperature on the mechanical properties of silica products," by A. J. Dale.

Oct. 5.—INSTITUTION OF SANITARY ENGINEERS. Opening Sessional Meeting.

Oct. 7.—SOCIETY OF CHEMICAL INDUSTRY. *Manchester Section.* Chairman's Address, by C. J. T. Cronshaw.

THE INSTITUTE OF METALS

Dr. L. Aitchison, of Birmingham, gave the opening lecture of the annual meeting of the Institute of Metals at Derby on September 6, with the president, Sir John Dewrance, K.B.E., in the Chair. Dr. Aitchison said that the reasons for the employment of the non-ferrous metals in our various systems of transport are very similar to those that govern their utilisation in all other branches of engineering. The non-ferrous metals and alloys are only needed when they can offer certain chemical or physical properties that are required by the engineer, and that are not possessed by iron and steel. In general, the properties that lead to the greatest employment of the non-ferrous metals and alloys are:—(1) A high resistance to corrosion; (2) high values of thermal or electrical conductivity; and (3) a low value of specific gravity. In addition, the properties of ease of machining, ease of cold working, and simplicity of casting contribute to the wider usefulness of the materials.

The use of non-ferrous metals on account of high electrical or high thermal conductivity is particularly illustrated by the purposes to which copper is put. This metal enters very extensively into the construction of electrical plant, whilst its thermal conductivity is made use of in boiler tubes and the like.

A high resistance to corrosion is a conspicuous feature of nickel and its alloys. These metals are not very extensively used in connexion with transport, but an example is found in cupro-nickel condenser tubes. Many examples of good resistance to corrosion are found in the alloys of copper. Typical illustrations of the use of this metal and its alloys on this account occur in condenser tubes and turbine blading, as well as in gun metal and phosphor bronze castings, which are extensively employed in ship construction.

The use of metals having a much lower specific gravity than iron and steel, and having at the same time mechanical properties comparable with those of the ferrous metals, is of great importance in transport systems. The alloys actually employed are those based upon aluminium and magnesium. The alloys of aluminium at the present time are, of course, much more extensively employed than the alloys of magnesium, and the aluminium materials find their way into a great many parts, both in the cast and in the wrought condition. A variety of aluminium casting alloys can be employed, and are more or less interchangeable, but most of the wrought parts are made in duralumin.

An important branch of modern transport is that comprised by aeroplanes, seaplanes, flying boats, and airships, and in all these branches of transport lightness is a property which is prized very greatly. The employment of the non-ferrous metals in these different forms of aeronautical structure, as well as in the engines that are employed to drive them, afford very interesting examples of the value to the engineer of the low specific gravity of the light aluminium alloys—these being one third of those of the irons and steels.

Another field into which non-ferrous metals enter very largely is that of anti-friction materials. These are of various kinds, having tin, or lead, or copper as their basis. They are able to act in a way that no steel or iron is able to rival.

Dr. Marie L. V. Gayler discussed the effect of under-cooling on the macro- and micro-structure of some silicon-aluminium and copper-aluminium alloys. It has been found impossible to under-cool "modified" silicon-aluminium alloys systematically, and it has been shown that the curves of solubility represented by the "modified" diagram correspond closely to the supersolubility curves of the "normal" alloys.

Dr. A. G. C. Gwyer and H. W. L. Phillips dealt with the constitution of binary alloys of aluminium with silicon and with iron. The eutectiferous nature of the aluminium-silicon system has been confirmed, and special attention paid to the solubility of silicon in solid aluminium. The position of the Al-FeAl₃ eutectic has been redetermined, and the structure of the alloys lying towards the middle of the constitutional diagram has been, it is thought, elucidated. The paper also dealt with the constitution of certain of the ternary alloys of aluminium, silicon, and iron, under both equilibrium and metastable conditions. The latter are of considerable practical importance, because they are met with not only in commercial alloys, but also in commercially pure aluminium.

Mr. A. R. Raper gave a paper on "The equilibrium diagram of copper-tin alloys containing from 10 to 25 atomic per cent. of tin." This investigation on the copper-tin alloys forms a continuation of the work done by Stockdale on this system. The alloys were examined both by thermal and micrographic analysis, and the results obtained confirm in many respects the classical work of Roberts, Austen and Heycock and Neville. The α - β boundary shows a sudden change in direction at 580°, which, together with other micrographic evidence, favours Stockdale's view of a polymorphic change of the β constituent. The eutectoid point has been found to be at Sn 16.15 (or 73.15% Cu by weight), the temperature of the inversion being 520°. The "transformation" curve has been determined carefully by thermal analysis, and the results are entirely in agreement with those of Roberts-Austen and Stansfield. In particular, the slight horizontal indicated by them at about 610° has been confirmed. As determined by the present author, it exists from Sn 22.5 to Sn 25 at a temperature of 638°. The inclusion of this new horizontal in the diagram makes the interpretation of this region easier, and evidence for a new eutectoid at Sn 23 has been obtained.

Discussing the "Effect of work and annealing on the lead-tin eutectic," Mr. F. Hargreaves found a marked softening action of work at air temperature on the lead-tin eutectic. With 78% reduction in thickness, the Brinell hardness is reduced from about 14 in the chill-cast condition to 4.2 when tested immediately after hammering. This value is actually lower than that of either constituent in the pure state.

"The reaction between solid magnesium and liquid tin" was described by Dr. W. Hume-Rothery. The reaction was studied between 250° C. and 350° C. in order to see whether reactions of the type, primary solid X + liquid = secondary solid Y, can proceed when the solid phase concerned do not form solid solutions. When a rod of magnesium is stood in a limited quantity of molten

tin, the magnesium dissolves until the liquid reaches the equilibrium composition at the particular temperature concerned. Since, however, true equilibrium requires the compound Mg_2Sn (probably Mg_4Sn_3) as the phase in equilibrium with the liquid, a further reaction of the type, solid magnesium + liquid = solid magnesium stannide, tends to take place, and the above point can be tested, since no solid solutions are formed. The experiments show that when sufficient magnesium has dissolved to give the liquid the equilibrium composition, all further direct reaction is stopped by a thin film of magnesium stannide which shows no appreciable thickening even after three weeks at the above temperatures. On the other hand, a few large crystals of magnesium stannide are sometimes formed by a slow reaction. This is probably the ordinary phenomenon of crystal growth due to surface energy effects, since the thin surface film has a high surface energy and so tends to form a more compact mass. But any solution at one point exposes more magnesium to the action of the liquid, and so the reaction gradually proceeds. The experiments are of interest in connexion with the fundamental principles underlying soldering and other reactions between solid and liquid metals.

A paper by W. T. Cook and W. R. D. Jones dealt with the forging of copper-magnesium alloys. The properties of the alloys in the forged and heat-treated conditions were examined. The ductility of these alloys depends primarily on the forging temperature. If this temperature be low the elongation and the reduction of area are impaired seriously, and the values are not restored by subsequent heat-treatment. The mechanical properties of copper-magnesium alloys containing up to 11% copper are not improved by simple heat-treatment, which causes a general decrease in test values. The addition of copper to magnesium up to about 2% is beneficial. Beyond this amount the increase in tenacity is small, whilst there is a regular decrease in ductility and a proportional increase in specific gravity. There is no advantage in adding more than this amount of copper to magnesium either for castings or for forgings. To obtain the best results the forging temperature must be controlled, and care must be taken to guard against any possibility of cold-shut when casting ingots for forging.

In a paper on "Grain growth in compressed metal powder," Dr. C. J. Smithells, W. R. Pitkin, and J. W. Avery described an investigation of the changes which take place in certain properties of bars of pressed tungsten powder when the temperature is gradually raised. These changes are attributed to grain growth, which is shown to begin at a temperature determined by the particle size of the powder and the pressure used in forming the bar. Using powders whose mean particle size varied from 0.6 to 3.5 μ , and pressures between 8 and 32 tons/in.², the temperature at which grain growth could first be detected varied from 1100° K. to 1500° K. These conditions cover those usually employed in the technical preparation of ductile tungsten. The results are in conflict with those of Sauerwald, who was unable to detect grain growth below 2800° K., but are consistent with the established facts of grain growth in worked metals.

In a paper on "The constitution and physical properties of some of the alloys of copper, zinc, and cadmium," C. H. M. Jenkins dealt with the constitution of the copper-zinc-cadmium alloys, and discussed the physical properties of the two most commonly used brasses containing small proportions of cadmium. The study shows a complex constitution in the range of the ternary system where the copper content exceeds 45% and the cadmium content is less than 10%. The solid solubility of cadmium in α brass diminishes with increasing proportions of zinc from a maximum value of 2.7%. Cadmium present beyond the proportion retained in solid solution is found to occur as the binary constituent, Cu_2Cd . The alloys whose constituents are α brass and more than a trace of Cu_2Cd commence to melt at comparatively low temperatures between 549° and 614° C. Traces of free Cu_2Cd on heating dissolve in the α phase without melting, owing to the slightly increased solubility at higher temperatures. A peritectic reaction, in which the β phase of the Cu-Zn system reacts with liquid to form the α phase and Cu_2Cd , occurs in this system at 614° C., considerably affecting the properties of the alloys. This reaction is primarily due to the result of the two peritectic reactions found in the binary copper-zinc and copper cadmium alloys, at 906° and 549° C. respectively. The effect of cadmium on β brass is noticeable in a different manner. This phase shows a greatly increased solid solubility for cadmium with increase of temperature, reaching a maximum value at 8%. At low temperatures the γ constituent seems to have a greater power than the β phase of retaining cadmium in solid solution. The effect of cadmium on the physical properties of 70 : 30 and 60 : 40 brass has been studied by the use of cadmium-bearing zinc containing proportions of cadmium decidedly in excess of those likely to be encountered in retort zinc. The results show that the greater proportion of the cadmium content of the zinc is retained in the brass, and is not lost by oxidation or volatilisation during melting. The presence of less than 0.2% of cadmium seems to prevent the hot-rolling of 70 : 30 brass and cadmium, and of more than 0.5% to increase to a slight extent the liability to unsoundness in cast material. The general results indicate that the use of cadmium-bearing zinc does not produce any marked alteration in the physical properties of the brass. Additions of cadmium up to 1% by weight cause an improvement in the tensile strength, generally accompanied by a reduction in elongation. The effect is most noticeable in the cast 70 : 30 brass, and is less pronounced in worked material.

Some experiments were described by H. Sutton and A. J. Sidery, in which samples of aluminium and aluminium alloys were treated by various protective processes, including anodic oxidation, zinc-, cadmium-, and nickel-plating. The resistance of aluminium, duralumin, and of certain other aluminium alloys to corrosion by sea-water is considerably increased by anodic oxidation and the subsequent application of a grease, such as lanoline. Electro-deposited coatings of zinc, 0.0005 in. thick, afforded better protection to aluminium than did coatings of cadmium of similar thickness, but the two types of deposit appeared to give an approximately equal degree of protection when applied to alloys of

The Golden Wedding of Professor and Mrs. Armstrong: A Family Group

aluminium. Unsatisfactory results were obtained from nickel deposits of normal thickness.

The nature of the film produced by anodic oxidation of aluminium was discussed by H. Sutton and J. W. W. Willstrop, who described a method of isolating the film from anodically treated aluminium. The metallic aluminium is volatilized in dry hydrogen chloride. The films isolated from treated commercial aluminium sheet are usually of a grey colour, due to traces of carbon left behind when the aluminium sublimes as chloride. The presence of elementary silicon in films produced on commercial aluminium is also shown. Films varying in thickness from 0.033μ to 2μ have been obtained, the thickness of the film produced by the usual standard treatment being about 1μ . From the volume of gas evolved by treated aluminium when heated *in vacuo* to 1200°C ., the film is shown to consist of oxide and not of hydroxide.

In a paper on "Age-hardening tests with elektron alloys," Dr. K. L. Meissner discussed the capability of age-hardening of six different elektron alloys, made up by the I. G. Farbenindustrie A.-G. at Bitterfeld (Germany), with respect to ageing at room temperature and at elevated temperatures up to 200°C ., with different ageing periods of from 8 to 40 hrs.

Dr. W. Humm-Rothery and S. W. Rowell described an investigation of the equilibrium diagram of the system magnesium-cadmium by thermal and microscopic methods. The system contains a solid solution based on cadmium and denoted α , a definite inter-

metallic compound MgCd_2 , and a solid solution in magnesium denoted β . The solid solution α extends from 0 to about 24 atomic per cent. magnesium at most temperatures. The compound MgCd_2 does not form any solid solutions, whilst the β solid solution extends from about 40 to 100 atomic per cent. magnesium. The solidus and liquidus are shown not to meet at the composition 50 atomic per cent. as reported by the earlier workers. The β solid solution undergoes a transformation at temperatures about 200° to 250°C ., but the maximum temperature of this change is at 54 atomic per cent., and not at 50 atomic per cent., as previously reported. This change is unaccompanied by any alteration in microstructure, and it has not been possible to obtain any two-phase alloys in this region either by slow cooling or by quenching. It is suggested that the change is of the same nature as that of the β brasses. Prolonged annealing is necessary to attain equilibrium in the solid alloys in the neighbourhood of the compound MgCd_2 and the principal differences between the present and the earlier work are due to the fact that the former investigators did not anneal their alloys for a sufficient time.

In a "Note on cathodic disintegration as a method of etching specimens for metallography," Dr. Cyril S. Smith showed that the well-known phenomenon of cathodic sputtering can be used to develop the structure of metal specimens for microscopic examination. Silver-copper alloys are particularly suitable for etching by this process, which causes staining of the copper-rich constituent as well as removal of the silver.

CORRESPONDENCE

A NOTE ON THE FORMATION OF ELEMENTS

SIR,—The rarity of the rare gases has been commented upon before as being in itself a phenomenon which was remarkable (*e.g.*, Aston, *Nature*, November 29, 1924). An explanation of it, as well as of several other independent phenomena, can be offered on the hypothesis that the evolution of the elements from the primordial protons and electrons takes place by the following steps:—

(a) An initial combination to form rare gas nuclei ;

(b) The synthesis of the nuclei of the remaining elements from the rare gas nuclei, the protons, and the electrons combining amongst themselves.

The Table I illustrates the results to be expected from this hypothesis, any element marked in it being obtained by the combination of the isotopes of the rare gases given in the first row vertically above it and the column in its line to the extreme left. The isotope values are marked in figures, and are those given by Aston (*Phil. Mag.*, 49, p. 1198). The isotopes 18, 34, and 38 have been included to complete the analogies between the formations of the halogens, though it is not indispensable to do so. The formation of an isotope by two or more independent combinations of the same rare gases is shown by the corresponding number in brackets near the isotope number (*e.g.*, Sn¹¹⁸⁽⁴⁾ denotes its formation from the following combinations:—A³⁴ + Kr⁸⁴, A⁴⁰ + Kr⁷⁸, A³⁸ + Kr⁸⁰, A³⁶ + Kr⁸²). The table shows the elements formed by the combination of two

positive nuclei only, and hence expected to be commonest excepting sometimes when the synthesis is of lightest nuclei (*e.g.*, Si, O, etc.).

The following consequences of such an arrangement are to be expected:—

(1) The parent nuclei—those of the rare gases are rare.

(2) Elements resulting from synthesis of nuclei of increasing mass have increasing rarity and instability.

(3) Isotopes of similarly formed elements show similar mass spectra, *e.g.*, the remarkable similarity between the mass spectra of Sn and Cd, and Se and Kr, observed by Aston (*Phil. Mag.*, 49, 1196), even though the pairs have not all the isotopes in common.

(4) The stellar spectra indicate, as we proceed from the hot type stars to the cooler M-type, the emergence in succession of the elements H, He, Si, O, N ; Ca, Mg ; Fe, alkalis and alkaline earths ; other metals.

(5) In the stage of formation of the earlier nuclei these will preponderate in the composition of the body. As further stages are attained, newer elements are formed, and thus the latter diminish in proportion. An example is the preponderance of Si and O over Fe, Ca, etc. in the composition of the B and A types of stars ; and then the gradual ascendancy gained by the latter over the former as we proceed to succeeding types, as in the sun. Proceeding still further, we find in the earth this ascendancy greatly reduced (*cf.* Miss C. E. Moore and H. N. Russell, *Astr. Journ.*, 43, 1, p. 12). This finds an explanation in the considerations put forward below.

TABLE I

	H 1	He 4	Ne (18), 20, 22	A (34), 36, (38), 40	Kr 78, 80, 82, 83, 84, 86	Xe 124, 126, 128, 129, 130, 131, 132, 134, 136	Radon 222

Kr	—	—	—	—	Rare earths ; At. wts., 156—176 At. Nos., 72 and less	Radio-active elements	..
Xe	—	—	—	—	—	Unstable nuclei	..
Radon	—	—	—	—	—	—	..

To show the elements formed by the combination of two positive nuclei and a number of electrons, an electron reducing the atomic number by unity. The small figures denote atomic weight of isotopes.

(6) Any stage of formation would represent an equilibrium process, as many atomic nuclei being formed as are disintegrating at any instant. The condition for synthesis would be governed by the physical conditions, such as temperature, pressure, etc. of the surroundings only; while disintegration can take place due to these same conditions as well as the internal forces brought into existence within the nucleus. Heavier nuclei would be more complex and hence more unstable; therefore, these are more liable to disruption through the latter cause. A case in point is that of radioactivity. The presence of the radioactive elements in the stars is extremely doubtful, while in the earth they are believed to be concentrated in the upper crust only. This would show a late start and an early inhibition of their formation after the separation of the earth from the sun. The present-day radioactivity is a phenomenon showing the disintegration of heavy nuclei due to instability only, while the process of formation has already ceased.

SPECTRUM ANALYSIS

SIR,—Difficulties of reproduction have caused Fig. 3 in my article on "Spectrum analysis in metallurgy" (CHEMISTRY AND INDUSTRY, August 19, p. 745) to be meaningless, and so I write to say that I shall be glad to send to anyone interested, a contact print from the original negative on receipt of stamped envelope.

The word "spectra" in line 1 should be "spectral."

Yours faithfully,

The Laboratory,
Batchelor, Robinson & Co., Ltd.,
Llanelli

J. R. GREEN

PERSONAL AND OTHER ITEMS

Sir Alfred and Lady Mond have returned to London from Aix-les-Bains and Evian-les-Bains.

Sir Frank Baines, who has retired from the position of Director of Works at the Office of Works, has been appointed consultant to Imperial Chemical Industries, Ltd., on all architectural and constructional matters.

Mr. A. Maude has been appointed general manager of James Woolley, Sons & Co., Ltd., Manchester.

Mr. F. Penman has been appointed assistant research chemist to the Victorian Department of Agriculture.

The annual congress of the International Union of Pure and Applied Chemistry opened in Warsaw on September 3.

The Lister centenary exhibition at the Wellcome Historical Medical Museum, 54A, Wigmore Street, will be closed on October 1.

The late Mr. P. Mernagh, a member of the staff of Public Analyst of the London County Council, left £3143.

The late Mr. F. Bentley, of Birkenhead, paint manufacturer, left £91,616.

The late Mr. M. Cox, late director of Mather & Platt, Ltd., left £44,096.

The death is announced of Mr. S. A. Russell, a director of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., of Silvertown, chairman of the India Rubber Manufacturers' Association, and a member of the board of management of the British Rubber and Tyre Manufacturers' Research Association.

Safeguarding of Key Industries—Appointment of Referee and Panel

Under the provisions of Section 1, Sub-section (5), of the Safeguarding of Industries Act, 1921, and of Section 10, Sub-section (4), of the Finance Act, 1926, complaints as to the improper inclusion of articles in, or their exclusion from, the lists of articles chargeable with duty under Part I of the Safeguarding of Industries Act, as amended by the Finance Act, 1926, have to be referred for decision to a tribunal consisting of the Referee appointed by the Lord Chancellor and of two persons selected by the Lord Chancellor from a panel of persons of special scientific attainments appointed by the President of the Board of Trade. (Cf. p. 821).

The Lord Chancellor has appointed Mr. A. A. Hudson, K.C., to be the Referee, and the President of the Board of Trade has appointed the following gentlemen to be the panel of persons of special scientific attainments:—Mr. A. Chaston Chapman, F.R.S., Prof. F. G. Donnan, C.B.E., F.R.S., Dr. J. H. Jeans, F.R.S., Prof. F. A. Lindemann, F.R.S., Prof. S. Smiles, O.B.E., F.R.S., and Prof. J. F. Thorpe, C.B.E., F.R.S.

Isopropyl Alcohol Regulations, 1927

Regulations have been made by the Commissioners of Customs and Excise requiring, in virtue of Section 16 of the Finance Act, 1927, that all who import, manufacture, sell or use isopropyl alcohol shall furnish certain information, and that manufacturing premises shall be registered.

Orange Juice as an Antiscorbutic

By Order in Council, the use of concentrated orange juice is authorised as an antiscorbutic on board merchant ships. The juice must contain not less than 70% of total soluble solids by weight; it must be free from alcoholic fermentation, and contain no mould growths. Cane sugar up to 20% by weight of the finished product may be added, but the juice should not contain any added colouring matter, chemical preservatives, or metallic impurities.

Exports of Synthetic Nitrates

According to the *Financial Times*, the production of nitrates by the Synthetic Ammonia & Nitrates Company, whose works are at Billingham, have increased so much that the British exports now almost equal and will soon outstrip those from Germany.

The Thermal Efficiency of Electrical Generation

Discussing the thermal efficiency of electric generating stations, Mr. H. Quigley ("World Power," July, 1927) states that the average fuel consumption per electric unit generated in British generating stations has diminished from 3.11 lb. to 2.40 lb. Taking the average of 25 of the largest and most efficient stations in Great Britain (representing 25% of the national output of electricity), the average consumption per unit has fallen since 1922 from 2.05 lb. to 1.80 lb. In 1925–26 the Barton (Manchester) station achieved a record by

and practices will be shown. The chemical bodies are co-operating closely to make the Exposition a success, and there will be a special course of lectures for students conducted by Prof. W. T. Read.

Some New Substantive Polyazo Dyes

E. F. Hitch and F. H. Smith, in a paper read at the Detroit meeting of the American Chemical Society, describe a number of new direct cotton dyes containing four or more azo groups. Some of the dyes, which contain eight azo groups, have remarkable affinity for vegetable fibres, and possess good solubility. All these dyes contain two or more para-amino residues, and are prepared by coupling two molecular equivalents of a tetrazo body, such as tetrazo-benzidine, to a component capable of double coupling, such as H-acid, then combining this new tetrazo compound with two molecular equivalents of an end-component. If one of these end-components is capable of double coupling, the dye can be combined with diazo or tetrazo bodies to form dyes having one or more additional azo groups.

German Nitrogen Industry

The Hibernia concern is contemplating the erection of two new plants in Westphalia to utilise the Mont Ceniz process for the manufacture of synthetic ammonia. The output, believed to be about 4 tons a day, would thus be brought eventually to the equivalent of 15,000 metric tons of fixed nitrogen annually.

German Artificial Silk Industry

Speaking at the general meeting of the Vereinigte Glanzstoff Fabriken A.-G., held on August 27 (cf. CHEM. & IND., Sept. 2, p. 790), the chairman discussed the expansion of the artificial silk industry, and said that the new factory near Cologne was constructed in conjunction with Messrs. Courtauld's, and that the Vereinigte Glanzstoff Fabriken and the Dutch Enka Co. had jointly taken over the Giesches Erben artificial silk factories, which were now being extended. A new silk factory had also been erected in co-operation with the I.-G. Farbenindustrie, and the Bemberg concern, allied to the Vereinigte Glanzstoff Fabriken, was considerably widening its activities. All these plans had involved considerable outlay. Perhaps the most important event in the recent history of the company was that a firm footing had been obtained in the American market through the increased interest of the Vereinigte Glanzstoff Fabriken in the American Bemberg co-operation. The board of the Vereinigte Glanzstoff Fabriken was convinced that the development of the artificial silk industry had not reached its full tide, and that a period of further expansion lay ahead.

The Bemberg Artificial Silk Co. has decided to increase its capital by 12,000,000 marks (£600,000) to 28,000,000 marks (£1,400,000). The money will be used to repay an American loan (for extension of the factory), and to carry out further extensions. The dividend paid by the company will be larger than last year, when 8% was paid.

Erratum

On line 6 of p. 786, col. ii, of the issue of September 2, for "South Shields" read "North Shields."

REVIEWS

THE ELEMENTS OF CHEMISTRY. By W. FOSTER, A.M., Ph.D. Second printing, corrected. Pp. xviii+576. New York: D. Van Nostrand Co., 1926. Price \$2.

Intended for students having no previous knowledge of chemistry, this book may be recommended as presenting, in an adequate and attractive manner, a well-knit account of fact, theory, and application. It is freely illustrated, many of the figures and photographs, depicting the application of the science to the arts of peace and of war, being particularly interesting. It is justly claimed that the language is simple and direct, and it is emphasised that "science is a method, and not a collection of facts." The 47 chapters are provided with summaries and exercises; a number of problems are also included, together with references for collateral reading.

A. A. E.

MODERN SOAP AND GLYCERINE MANUFACTURE. By E. T. WEBB. Pp. 224. London: Davis Bros., 1927. Price 25s.

This book is the antithesis of most of the modern books published on soap manufacture, in that no attempt is made to describe all the processes and plant which have been used or proposed for the manufacture of soap from time to time, and which have now fallen completely out of use. The author confines himself strictly to the essentially practical side of modern soap manufacture and with success, at any rate as regards the actual soap boiling method for the manufacture of modern types of household soaps.

A very full and detailed description of the preparation of an ordinary boiled soap is the outstanding feature of the soap section. The author is inclined to dogmatise somewhat in places, as, for instance, his insistence on the absence of salt in the finishing operation, although this is by no means necessary, as the majority of commercial soaps can be and are finished quite as successfully with brine as without it.

A point of interest to be noted is an attempt to classify the various commercial oils according to their soap-making properties by means of an empirical factor derived from the numerical difference between the saponification value and the iodine number of the various fats and oils ("I.N.S." value), together with a figure which the author has termed the "soap solubility ratio," and which is obtained from the so-called "I.N.S." number. The figures so obtained are of interest in that they do indicate to some extent the type of soap likely to be obtained from mixtures of fats which are required to possess certain general properties when made into soap.

The preparation of "run" and "glued up" soaps is dealt with in outline only, as is also the preparation of toilet soaps, dry soap powders, cold process soaps, and half-boiled soaps. There is an interesting chapter on quantity relations in soap manufacture and other necessary details of interest, such as the influence of radiation losses in connexion with the time of settling of the finished soap. In general, the practical data contained in the book are accurate and reliable.

A considerable section of the whole book (about one third) is devoted to the question of glycerin recovery, and full consideration has been given to the question of evaporation and distillation. The section on distillation is very full and complete, especially as regards the Rumbke system, with which the author is evidently well acquainted. He also devotes considerable space to the Wood still, and gives a fuller description of its working than is found in most text books. This system of distillation is extremely efficient in practice, and the author's opinion that it seems to be the system of the future is certainly borne out as far as practical experience is concerned.

The book as a whole is a useful addition to the literature dealing with the practical side of soap manufacture, and as such should prove of particular interest where an insight into modern working practice is desired.

F. G. REYNOLDS

1. WÄRMETECHNISCHE GRUNDLAGEN DER INDUSTRIEÖFEN. By Prof. H. v. JÜTTNER. Vol. I. Der Industrieöfen in einzeldarstellungen, edited by L. Litinsky. Pp. viii + 260. Leipzig: Otto Spamer, 1927. Price, paper, 20 r.m., bound, 23 r.m.
2. WÄRMEWIRTSCHAFT IN DER KERAMISCHEN INDUSTRIE. By Dr. W. STEGER. Part V. Wärmelehre und Wärmewirtschaft in einzeldarstellungen, edited by Prof. H. Pfützner, with the assistance of Profs. A. Naegel and W. Pauer. Pp. x + 147. Dresden and Leipzig: Th. Steinkopff, 1927. Price, paper, 8 m., bound, 9.50 m.

Both these works are units of series appearing in Germany and dealing with fuel economy. They are indicative of the general tendency there to promote economy of fuel and energy as a means to improve the competitive position of manufacturers. In Spamer's series it is proposed to devote each volume to a type of furnace, whilst in Steinkopff's series each volume is concerned with a particular industry, and much can be said for each method of classification.

(1) v. Jüttner's book, being introductory to its series, deals with heat and fuels in general. It is an uncommon type of fuel book, starting off with the physical theory of heat in which is included the laws of thermodynamics and the quantum theory as applied to specific heats. Heat transmission follows, then combustion, the production of heat balances, and lastly a survey of fuels in general. The term "general survey" seems to be an apt one. The author is known as a maker of books rather than experiments, and seems to devote undue space to tabulating and graphing a variety of quantities divorced from reality. The composition is given of gases in equilibrium with carbon under a wide range of temperatures and pressures, all expressed to the third decimal place and based on data of doubtful validity. Much of the matter is compiled uncritically, while the free spelling of names shakes confidence in the author's care. Thus we find "Boudoir" for "Boudouard," "Gontal" instead of "Goutal," and we read of the "Wet Carburizing Co. of Dufried," which we interpret as a concern which, under a somewhat similar name, formerly operated a process in Dumsfries. The book has

a certain use for an expert, but it would be dangerous to quote it as authoritative.

(2) The other book by Steger is the fifth of its series, and has its own special interest because, in the ceramic industries, fuel consumption and costs represent so large a part of the expenses of production, and yet the literature giving a scientific treatment of the subject is scanty. The book is not a mere descriptive account of furnaces. The author rightly begins by discussing the peculiar chemical and physical phenomena of these industrial processes without which no rational discussion of their fuel problem can be made. For the quantitative treatment of drying he uses a Mollier diagram of the properties of steam. The main section deals with the firing process, and while types of furnaces are described, space is mainly and rightly devoted to the thermal analysis of the process and to the scope of methods for improving the thermal efficiency. The use of lignites in increasing quantity commands attention. Measuring instruments are described, but much of the matter here is not special to ceramics and, at times, is so brief as to be superficial and hardly worth inclusion. The chapter on heat balances is valuable, and especially the collation from literature of a number of results published for typical furnaces. In view of their use where conditions have allowed, it would have been interesting if the author could have given some data on electrically-heated furnaces. There is still something of the character of arts and crafts about the ceramic industries which compels the scientific man to walk delicately when seeking to modify existing practice. In pursuing thrift in the use of heat the scientific man is on firmer ground, and to him this book should make a special appeal.

H. J. HODSMAN

DISPERSOIDOLOGICAL INVESTIGATIONS. By Prof. P. P. VON WEIMARN and Collaborators. Reports of the Imperial Industrial Research Institute. XI. Vol. 7. No. 8. Pp. 22. March, 1926. XII-XVI. Vol. 7. No. 17. Pp. 51. December, 1926. Osaka: Japan: Imperial Industrial Research Institute, Department of Commerce.

In these reports the author continues his investigations on the dispersion of silk and of cellulose by solutions of very soluble salts, more particularly the chlorides, iodides, and thiocyanates of the alkaline earth metals. The general nature of this action is illustrated by the close similarity of the effect on substances as dissimilar as fibroin and cellulose. The dispersions of silk, on dehydration by suitable salts or by alcohol, yield very interesting elastic masses resembling rubber or animal tendon.

As the action of the salts used in the process of dispersion and in other colloidal phenomena has very generally been ascribed to the anion, it is of great interest to note a new result obtained by v. Weimarn: that highly soluble *non-electrolytes*, like the polyphenols, also disperse silk and other proteins, as well as cellulose. This is a point for much further study.

These reports, like previous ones, are lavishly illustrated with admirable collotype reproductions of photomicrographs and ultramicrographs.

EMIL HATSCHEK

COMPANY NEWS

INTERNATIONAL HOLDINGS AND INVESTMENT CO.

The annual report for the year ended June 30 last states that the directors propose to sell the assets of this company to a Canadian company—the International Holding and Investment Company—registered in Quebec, by which it is hoped to broaden the market for the shares and relieve the company from paying English income tax on the revenue that is derived from Continental sources. The company's interest in the assets to be transferred to the Canadian company will be exactly equivalent to the present interests of the shareholders in them, so that in the event of liquidation each shareholder should receive the same equity in the Canadian company as he now holds in the English company. The company, which recently changed its name from the Cellulose Holdings and Investment Company to its present title, was formed to finance British Celanese, Ltd., and is entitled to an annual royalty of 3% on the Celanese Company's sales to a value of £3,000,000 and 1% on sales value in excess of £3,000,000 for 25 years after £90,000 has been paid in any year. During the year the company sold £425,000, part of its holding of £700,000 7% debenture stock in British Celanese, and has also sold its holding of preference shares in that company, with the exception of 1500 shares. On the other hand the company has acquired £150,000 6½% income debentures in British Celanese. The company has recently acquired interests in the Fabrique de Soie Artificielle de Tubize, the Société Française de Tubize, the Société Internationale d'Energie Hydro-Électrique (Sidro), and certain other undertakings. The paid-up capital of the company has increased from £53,025 in 1926 to £268,051, and the capital reserve from £138,252 to £1,258,250. The net profit after meeting all charges and debenture stockholders' participation in profits, amounted to £55,547, compared with £30,949 for 1926. A dividend of 9d. per share was declared on the ordinary shares, against 7d. for the previous year.

As a result of negotiations it is announced that the company has agreed to waive its right to appoint three directors to British Celanese, Ltd. In consideration of this British Celanese will raise no objection to the royalty payable to the Holdings Company being sold and transferred to the Canadian company.

BRITISH GLUES AND CHEMICALS, LTD.

The accounts for the year to May 31, 1927, show a loss of £12,761, after allowing £32,216 for depreciation, compared with a loss of £22,919 for 1926, after allowing £29,123 for depreciation. No dividend will be paid on the preference shares, on which the payment is in arrear since April, 1922.

BINNEY & SMITH AND ASHBY, LTD.

The amalgamation is announced of the carbon, lamp and vegetable black interests of the two old-established companies, Messrs. Binney & Smith Company and Messrs. Morris Ashby, Ltd., who will trade under the name of Binney & Smith and Ashby, Ltd., with registered offices at 17, Laurence Pountney Lane, London, E.C.4. The former is the pioneer of the carbon black business in America, whilst the latter was the first importer of this product into the United Kingdom for

commercial use nearly 60 years ago. It is intended to hold stocks of the well-known grades of carbon, lamp and vegetable black sold by these companies at all the principal distributing points of the United Kingdom, insuring users of prompt service.

BUELL COMBUSTION CO., LTD.

The incorporation is announced (for information only) of the above company with an authorised capital of £250,000 and an issued capital of £173,507. The company was incorporated in May, 1927, to acquire from Bolton & Partners, Ltd., and the Buell Pulverised Coal Syndicate, Ltd. the Buell pulverised coal systems, the goodwill and business in connexion with such systems, and the benefit of all pending contracts, including a licence granted to Babcock & Wilcox, Ltd., for use of the systems with water-tube boilers.

HORACE CORY AND CO., LTD.

The profit made by this company of colour manufacturers for 1926, after placing £1000 to reserve, was £10,491, plus £3419 brought forward, compared with a profit of £13,269, after placing £3000 to reserve, for 1925. A further dividend has been recommended of 5%, making 9%, against 10%, carrying forward £2160.

J. STONE AND CO., LTD.

The net profit for 1926 was £180,011, plus £67,075 brought in, compared with £161,058 for 1925. The dividend on the preference shares absorbed £39,000, and the directors recommend placing £45,133 to reserve, paying a dividend of 10% and a bonus of 1s. per share on the ordinary shares, £72,892 being carried forward.

HARBEN'S (VISCOSE SILK MANUFACTURERS), LTD.

At an extraordinary general meeting held on May 13, presided over by Sir Charles Mandelberg (chairman), the creation was approved of 200,000 new 8% first cumulative participating preference shares of £1, for 140,000 of which the Branston Artificial Silk Co. would subscribe at par. The balance of 60,000 shares would be held in reserve for acquiring further auxiliary plant and other purposes. In consideration for the taking up of the 140,000 preference shares, Harben's would put the Branston Company's works on a producing basis. This would enable Harben's to take steps immediately to extend its plant in order to increase its output to 18 tons per week. Since the beginning of the present year they had been producing and selling 9 tons per week at regular market prices. Orders were being received in excess of the capacity of the existing plant. The technical and research departments were fully alive to market requirements, and immediate steps were taken to meet demands for new effects or special yarns, and a thoroughly progressive policy was being adopted. The company was in a strong financial position, and if the profits continued at their present level, it would be able to pay a preference dividend by the end of the present year.

EASTMAN KODAK OF NEW JERSEY

A regular dividend has been announced of \$1.25 per share on the common stock, together with an extra dividend of \$0.75 per share.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£8 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1½d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.

Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Good demand. Grey, £14 10s.—£15 per ton. Liquor, 9d per gal.
 Charcoal.—£8—£9 per ton according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals.—8d.—9d. per lb. Crude 60's, 2s. 5d.—2s. 7d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 4d.—2s. 6d. per gal. Pale 95%, 2s. 2d.—2s. 3d. per gal. Dark, 90%, 1s. 9d.—1s. 10d.; 95%, 2s.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons, Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 5d. per gal. Pure, 1s. 6d.—1s. 7d. per gal.
 Xylol.—1s. 3d.—1s. 4d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d. per gal. Heavy, 9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 8½d.—9½d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, 8½d.—9½d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals.—£11 10s.—£12 per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—90s.—92s. 6d. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilio.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.
o-Cresol 29/31° C.—5½d. per lb.
m-Cresol 98/100%.—2s. 7½d. per lb.
p-Cresol 32/34° C.—2s. 8½d. per lb.
Dichloraniline.—2s. 3d. per lb.
Dimethylaniline.—1s. 11d. per lb.
Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
Dinitrochlorbenzene.—£84 per ton d/d.
Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
Diphenylamine.—2s. 10d. per lb. d/d.
α-Naphthol.—2s. per lb. d/d.
β-Naphthol.—11d.—1s. per lb. d/d.
α-Naphthylamine.—1s. 3d. per lb. d/d.
β-Naphthylamine.—3s. per lb. d/d.
p-Nitraniline.—1s. 8d. per lb.
m-Nitraniline.—3s. per lb. d/d.
o-Nitraniline.—5s. 9d. per lb.
Nitrobenzene.—6d. per lb., naked at works.
Nitronaphthalene.—1s. 3d. per lb. d/d.
R. Salt.—2s. 2d. per lb. 100% basis d/d.
Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
o-Toluidine.—7½d. per lb., naked at works.
p-Toluidine.—2s. 2d. per lb., ex works, naked.
m-Xylidine Acetate.—2s. 6d. per lb. 100%.
N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
Acid, Benzoic B.P.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
Acid, Camphoric.—19s.—21s. per lb.
Acid, Citric.—1s. 7d.—1s. 8d. per lb. Less 5%.
Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
Acid, Salicylic.—B.P. pulv. 1s. 3d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.
Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
Amidol.—9s. per lb. d/d.
Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
Amidopyrin.—8s. 6d. per lb.
Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
Atropine Sulphate.—11s. per oz. for English make.
Barbitone.—6s. per lb.
Benzonaphthol.—3s. 3d. per lb.
Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
Borax B.P.—Crystall 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
Bromides.—Ammonium.—2s. 2d.—2s. 3d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot.

Calcium Lactate.—1s. 2½d.—1s. 3½d. per lb.
Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
Chloral Hydrate.—3s. 6d. per lb., duty paid.
Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
Creosote Carbonate. 6s. per lb.
Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
Formaldehyde.—£39 per ton. Ex wharf in barrels.
Guaiacol Carbonate.—5s. per lb.
Hexamine.—2s. 4d.—2s. 6d. per lb.
Homatropine Hydrobromide.—30s. per oz.
Hydrastine Hydrochlor.—English make offered, 120s. per oz.
Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols. 2s. 3d. per gal. In carboys: Winchesters, 2s. 11d.—3s. 9d. per gal.; 20 vols., 4s. 3d. per gal.; Winchesters, 5s.—6s. 6d. per gal. Special prices for larger quantities.
Hydroquinone.—2s. 11d. per lb.
Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots, Potassium 4s. 1d. per lb. Sodium 4s. per lb.
Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
Iron Perchloride.—4d. per lb., 22s. per cwt.
Magnesium Carbonate.—Light Commercial £31 per ton net.
Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
Menthol.—A.B.R. recryst., B.P., 18s. 6d. per lb. net. Synthetic detached crystals, 9s.—10s. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 5d.—7s. 7d. per lb., Levig. 6s. 11d.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 8d.—5s. 10d. per lb., Powder, 5s. 1d.—5s. 3d. per lb.; White precip., Lump, 5s. 10d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 3d.—6s. 5d. per lb.; Yellow Oxide, 6s. 9d.—6s. 11d. per lb.; Persulph B.P.C., 6s.—6s. 2d. per lb.; Sulph. nig., 5s. 9d.—5s. 11d. per lb. Special prices for larger quantities.
Methyl Salicylate.—1s. 9d. per lb.
Methyl Sulphonol.—9s. 6d.—9s. 9d. per lb.
Metol.—11s. per lb. British make.
Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
Paraldehyde.—1s. 4d. per lb.
Phenacetin.—2s. 9d.—3s. per lb.
Phenazone.—4s. 3d.—4s. 6d. per lb.
Phenolphthalein.—6s.—6s. 3d. per lb.
Potass. Bitartrate.—99/100% (Cream of Tartar) 98s per cwt., less 2½%.
Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
Potass. Permanganate.—6d. per lb. spot.
Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).
Resorcin.—3s. 9d.—4s. per lb. spot.
Saccharin.—55s. per lb., and lower in quantity.
Salol.—2s. 4d. per lb.
Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hypsulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.
Sod. Nitroprusside.—16s. per lb.
Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
Sod. Salicylate.—Powder, 1s. 8½d.—1s. 9½d. per lb. Crystal, 1s. 9½d.—1s. 10½d. per lb.
Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton f.o.b., according to quantity, 1-cwt. kegs included.
Sulphonal.—6s. 6d.—6s. 9d. per lb.
Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—15s. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.
Aubepine (ex Anethole).—10s. 6d. per lb.
Amyl Acetate.—2s. per lb. **Amyl Butyrate**.—5s. 3d. per lb.
Amyl Salicylate.—3s. per lb.
Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. **Benzyl Alcohol free from Chlorine**.—2s. per lb.
Benzaldehyde free from Chlorine.—2s. 6d. per lb. **Benzyl Benzoate**.—2s. 6d. per lb.
Cinnamic Aldehyde.—Natural, 17s. per lb.
Coumarin.—10s. per lb.
Citronellol.—13s. 9d. per lb.
Citral.—8s. 3d. per lb.
Ethyl Cinnamate.—6s. 6d. per lb.
Ethyl Phthalate.—2s. 9d. per lb.
Eugenol.—8s. 6d. per lb. **Geraniol (Palmarosa)**.—18s. 6d. per lb. **Geraniol**.—6s. 6d.—10s. per lb. **Heliotropine**.—4s. 9d. per lb. **Iso Eugenol**.—13s. 6d. per lb. **Linalol (ex Bois de Rose)** 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb. **Linalyl Acetate (ex Bois de Rose)** 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.
Methyl Anthranilate.—8s. 6d. per lb.
Methyl Benzoate.—4s. per lb.
Musk Ketone.—35s. per lb.
Musk Xylol.—8s. per lb.
Nerolin.—4s. 6d. per lb.
Phenyl Ethyl Acetate.—12s. per lb.
Phenyl Ethyl Alcohol.—10s. 6d. per lb.
Rhodinol.—32s. 6d. per lb. **Safrol**.—1s. 6d. per lb. **Terpineol**.—1s. 8d. per lb. **Vanillin**.—17s.—17s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. **Anise**.—3s. per lb. **Bergamot**.—28s. per lb. **Bourbon Geranium**.—14s. 6d. per lb.
Camphor.—75s. per cwt. **Cananga, Java**, 26s. per lb. **Cassia, 80/85%**.—7s. 6d. per lb. **Cinnamon, Leaf**.—6d. per oz. **Citronella**.—Java 85/90%, 1s. 11d. per lb., Ceylon, Pure, 1s. 9d. per lb. **Clove, pure**.—6s. per lb.
Eucalyptus, 75/80%.—2s. 3d. per lb. **Lavender**.—Mont Blanc 38/40%, 20s. per lb. **Lemon**.—8s. per lb. **Lemon-grass**.—4s. 6d. per lb. **Orange, Sweet**.—11s. 3d. per lb. **Otto of Rose**.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. **Palma Rosa**.—10s. 6d. per lb. **Peppermint**.—Wayne County, 17s. 6d. per lb. **Japanese**, 8s. 3d. per lb. **Petitgrain**.—7s. 9d. per lb. **Sandalwood**.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Nov. 1st. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Sept. 15th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Blair, Desborough, Reynolds, Smith, and Thomson. Mixing liquids. 22,483—4. Aug. 26.

Comyn. Filters or separators. 22,321. Aug. 25.
 Ellinghouse. Emulsifying etc. apparatus. 22,510. Aug. 26.
 Fender, and Prodorite, Ltd. Acid-proof vessels. 22,061. Aug. 22.
 Hillier. Evaporators. 22,047. Aug. 22.
 Maccallum, and Smith & Blyth, Ltd. Grinding-mills. 22,459. Aug. 26.
 Soc. Ital. Pirelli. Degasifying liquids. 22,333. Aug. 25. (Italy, 31.8.26.)
 Verein. Schweizerische Rheinsalinen. Salt or evaporating pans. 22,403. (Switz., 15.9.26.)
 Wade (Riley Stoker Corp.). Pulverising apparatus. 22,503. Aug. 26.

I.—Complete Specifications

27,268 (1926). Cooper and Mason. Mixing or pugging mill. (276,196.)
 5015 (1927). Vernay. Filtering apparatus. (266,719.)
 9628 (1927). British Separators, Ltd., and Cahill. Centrifugal separating-apparatus. (276,268.)
 21,206 (1927). Frankl. Separation of gaseous mixtures. (276,292.)
 *10,497 (1927). Singer. Distilling liquids, particularly liquid hydrocarbons. (276,302.)
 *21,804 (1927). Siemens A. G. Purification of gas mixtures. (276,347.)

II.—Applications

Adam, Potter, and Gas Light & Coke Co. 22,542. See III.
 A.-G. f. Kohlensäure Ind., and Auerbach. Refining mineral oils etc. 22,181—2. Aug. 23. (Ger., 25.9.26 and 12.2.27.)
 Asiatic Petroleum Co., Ltd., and Joyce. Treating heavy petroleum oils etc. 22,561. Aug. 27.
 Aurig and Brühlmayr. Treatment of gases for removal of hydric sulphide etc. 22,273. Aug. 24.
 Coley. Low-temperature carbonisation of coal. 22,313. Aug. 25.
 Cutler. Dehydration of gas. 22,576. Aug. 27.
 Davidson. Retorts for treatment of oil shale etc. 22,297. Aug. 25.
 Hellthaler, and Riebeck'sche Montanwerke. Bleaching montana wax. 22,464. Aug. 26.
 Johnson (I.-G. Farbenind.). Production of mixtures of hydrogen and carbon monoxide. 22,275. Aug. 24. Production of ethylene. 22,596. Aug. 27.

II.—Complete Specifications

12,660 (1926). Gibson. Producing enriched illuminating or power gas. (276,065.)
 25,720 (1926). Dvorkovitz. Manufacture of hard coke. (276,181.)
 32,556 (1926). Still. Coke- and gas-producing furnaces. (263,817.)
 1657 (1927). Heppner. Increasing safety of porous and absorbent materials used for storing explosive. (261,846.)
 6811 (1927). Seelig. Cracking of oils. (268,323.)
 *10,497 (1927). Singer. See I.

III.—Application

Adam, Potter, and Gas Light & Coke Co. Distillation of oils etc. 22,542. Aug. 27.

III.—Complete Specification

32,978 (1926). Combustion Utilities Corp. Purification of tar acid-bearing oils. (276,216.)

IV.—Applications

Blair, Desborough, Reynolds, Smith, and Thomson. Manufacture of nitrated compounds. 22,485. Aug. 26.
 Carpmal (I.-G. Farbenind.). Manufacture of condensation products of benzanthrone-series. 22,381. Aug. 25.
 I.-G. Farbenind. Manufacture of arylazo-diarylamines. 22,087. Aug. 22. (Ger., 21.8.26.)
 Manufacture of dye-stuffs. 22,462. Aug. 26. (Ger., 21.10.26.) Manufacture

of monobenzoyldiaminoanthraquinones. 22,515. Aug. 26. (Ger., 30.8.26.)

Johnson (I.-G. Farbenind.). Manufacture of vat dyestuffs. 22,049. Aug. 22. Production of hydroxyalkylamines. 22,278. Aug. 24.

IV.—Complete Specifications

18,862 (1926). Carpmach (I.-G. Farbenind.). Manufacturing products of conversion of pericyannaphthalene-sulphonic acids. (276,126.)

21,947 (1926). British Dyestuffs Corp., and Wyler. See XX.

7061 (1927). Johnson (I.-G. Farbenind.). See XX.

*21,892 (1927). I.-G. Farbenind. Manufacture of azo-dyestuffs. (276,353.)

*22,087 (1927). I.-G. Farbenind. Manufacture of arylazo-dialkylamines. (276,372.)

V.—Applications

Fabrick van Chem. Producten. Manufacture of cellulose esters. 22,171. Aug. 23. (Fr., 24.3.27.)

Hands, and Spicers, Ltd. Production of cellulose ester etc. compositions. 22,586. Aug. 27.

Hardman. Treatment of cotton etc. 22,137. Aug. 25. (U.S., 20.10.26.)

I.-G. Farbenind. Manufacture of viscose silk. 22,362. Aug. 25. (Ger., 25.8.26.) Opening-up materials containing cellulose. 22,461. (Ger., 13.10.26.)

Johnson (I.-G. Farbenind.). Treatment of animal, vegetable, etc. materials. 22,276. Aug. 24.

Runkel. Recovery of cellulose from plants. 22,291. Aug. 14.

V.—Complete Specifications

18,337 (1926). Ellis (Kohnstamm & Co.). Degreasing textile materials. (276,121.)

6711 (1927). App. et Evaporateurs Kestner. Recovery of caustic soda from residual lyes after manufacture of artificial silk. (267,536.)

*21,610 (1927). Henkel & Cie. Reducing deterioration of colours of textile fabrics during washing. (276,337.)

*21,611 (1927). Henkel & Cie. Washing textile fabrics. (276,338.)

*21,612 (1927). Henkel & Cie. Detergent compositions. (276,339.)

VI.—Complete Specifications

14,275 (1926). Ellis (Chemical Works, formerly Sandoz). Dyeing of effect threads. (276,100.)

*21,613 (1927). Henkel & Cie. Halogen calcium-starch preparations. (276,340.)

*21,891 (1927). Heberlein & Co. Treatment of fabrics. (276,352.)

VII.—Applications

App. et Evaporateurs Kestner. Production of nitrate of lime. 22,466. Aug. 26. (Fr., 16.10.26.)

Clark, Newall, and Washington Chem. Co. Manufacture of magnesium carbonate. 22,383. Aug. 25.

Coley. Manufacture of zinc oxide. 22,314. Aug. 25. Gewerkschaft der Steinkohlenzeche Mont-Cenis. Purifying hydrogen. 22,180 and 22,488. Aug. 26 and 26. (Ger., 26.8.26 and 30.8.26.)

Johnson (I.-G. Farbenind.). 22,275. See II.

Sharp (Soc. Gén. Métallurgique de Hoboken). Manufacture of sulphuric acid. 22,159. Aug. 23.

Verein. Schweizerische Rheinsalinen. 22,403. See I.

VII.—Complete Specifications

12,661 (1926). Martin. See X.

16,064 (1926). Koehler. See X.

18,143 (1926). Jackson (Mathieson Alkali Works). Production of chromium compounds. (276,120.)

21,859 (1926). Kiscock. Producing molybdates. (276,155.)

29,164 (1926). Johnson (Duisberger Kupferhütte). See X.

6711 (1927). App. et Evaporateurs Kestner. See V.

*29,959 (1926). Liljenroth. Oxidising ammonia. (276,295.)

*15,515 (1927). I.-G. Farbenind. Storing dibasic calcium hypochlorite. (276,307.)

*18,850 (1927). Deutsche Gold- u. Silber-Scheideanstalt. Production of alkali hydride. (276,313.)

*21,826 (1927). Azogeno Soc. Anon., Toniolo and Tanzi. Manufacture of a non-hygroscopic or slightly hygroscopic double salt from calcium nitrate. (276,350.)

VIII.—Applications

Fender, and Prodorite, Ltd. 22,061. See I.

Hurlbut and Pryor. Glass-annealing leers etc. 22,455. Aug. 26.

IX.—Complete Specification

12,661 (1926). Martin. See X.

X.—Applications

Ashcroft. Metallurgy of ores. 22,478. Aug. 26.

British Thomson-Houston Co., Ltd. Carburising metals. 22,343. Aug. 25. (U.S., 26.8.26.)

Cole. Proofing metals against rust. 22,053. Aug. 22.

Coles. Disintegration of ores etc. 22,001. Aug. 22.

Coley. Reduction of ores, oxides, etc. 22,154—5. Aug. 23.

Separation of metals etc. 22,156. Aug. 23.

Dovel. Blast furnaces. 22,386. Aug. 25.

Ellis. Electroplating. 22,259. Aug. 24.

Elmore, Elmore, and Malan. Utilisation of cupriferous ores etc. 22,167. Aug. 23.

France. Apparatus for classification of ores etc. 22,186. Aug. 23. (Belg., 18.1.26.)

Washing minerals. 22,471. Aug. 26. (Belg., 4.12.26.)

Johnson (I.-G. Farbenind.). Recovery of metals etc. soluble in ammoniacal liquors. 22,279. Aug. 24.

Leaching metals etc. soluble in ammonia. 22,280. Aug. 24.

Metalbank u. Metallurgische Ges. Production of aluminum alloys. 22,496. Aug. 26. (Ger., 18.9.26.)

Smith. Reducing ores etc. 22,433. Aug. 26. (U.S., 4.4.27.)

X.—Complete Specifications

12,144 (1926). Hadfield. Manganese steel. (276,048.)

12,661 (1926). Martin. Manufacture of lime, gypsum, cements, etc., calcination of ores etc. (276,066.)

12,707 (1926). Hanemann. Manufacture of grey cast iron. (262,043.)

12,828 (1926). Frankl. Producing synthetic pig iron. (252,708.)

12,934 (1926). Bosse, Richter, Lauch, Siegelberg, and Koch. Metallising process. (252,710.)

16,064 (1926). Koehler. Forming metal phosphides. (276,112.)

26,051 (1926). Browne. Making sound silicon iron. (276,190.)

29,164 (1926). Johnson (Duisburger Kupferhütte). Recovery of copper, zinc, and other metals from solutions containing chlorides and sulphates. (276,200.)

5449 (1927). Cammell, Laird, & Co., Ltd., Allan, and Hague. Alloy steels. (276,249.)

*19,654 (1927). Krupp A.-G. Steel alloys. (276,317.)

XI.—Applications

Ellis. 22,259. See X.

Marks (Insulux Corp.). Insulating-compositions. 22,288. Aug. 24.

Soc. Ital. Pirelli. Impregnating insulating materials 22,330. Aug. 25. (Italy, 31.8.26.)

XI.—Complete Specifications

5184 (1926). Bleack. Primary batteries. (248,011.)

21,884 (1927). Internat. General Electric Co. High-frequency induction furnaces. (276,351.)

XII.—Complete Specification

23,140 (1926). Metallbank u. Metallurgische Ges. Treating crude oils and fats. (275,536.)

XIII.—Application

Imperial Chemical Industries, Ltd., and Jenkins. 22,481—2. See XXII.

XIV.—Applications

Galbraith and Mills. Manufacture of rubber. 22,027. Aug. 22.

Jackson (General Rubber Co.). Treating rubber latex. 22,347. Aug. 25.

Johnson (I.-G. Farbenind.). Production of raw rubber from rubber latex. 22,595. Aug. 27.

XIV.—Complete Specification

7700 (1927). Chem. Fabr. Kalk., and Oehme. Vulcanisation of rubber. (272,860.)

XVI.—Applications

Johnson (I.-G. Farbenind.). Manufacture of fertilisers. 22,277. Aug. 24.

Kensington. Manufacture of fertilisers. 22,385. Aug. 25.

XVI.—Complete Specification

*1419 (1927). Adelantado. Manufacture of phosphate fertilisers. (276,297.)

XVIII.—Applications

Claassen. Manufacture of baking-yeast. 22,504. Aug. 26. (Ger., 19.11.26.)

Johnson (I.-G. Farbenind.). Cultivating micro-organisms. 22,597. Aug. 27.

XIX.—Applications

Baker (Trehurne). Treating flour. 22,493. Aug. 26.

Claassen. 22,504. See XVIII.

N. V. Huygen & Wessel's Ingenieursbureau. Sterilising liquids. 22,346. Aug. 25. (Holland, 14.5.27.)

XIX.—Complete Specifications

19,428 (1926). Matzka. Preservation of eggs etc. (276,132.)

6290 (1927). Matzka. Preserving fruit juices and other liquids. (276,254.)

10,292 (1927). Woo. Manufacture of edible substances. (269,576.)

XX.—Applications

Albert. Manufacture of arsenobenzenes. 22,463. Aug. 26.

Blair, Desborough, Reynolds, Smith, and Thomson. 22,483—5. See IV.

Burstall and Morgan. Manufacture of metallic compounds of ethylenethiourea. 22,324. Aug. 25.

I.-G. Farbenind. Manufacture of condensation products of urea. 22,594. Aug. 27.

Soc. Chem. Ind. in Basle. Manufacture of gold-nucleic acid compounds. 22,360. Aug. 25. (Switz., 25.8.26.)

XX.—Complete Specifications

16,451 (1926). Binz, and R  th. Production of organic arseno compounds. (255,839.)

17,752 (1926). Binz, and R  th. Production of organic arseno compounds. (255,861.)

21,947 (1926). British Dyestuffs Corp., and Wyler. Manufacture of quinoline derivatives. (276,156.)

7061 (1927). Johnson (I.-G. Farbenind.). Manufacture of aldehydes. (267,925.)

XXI.—Application

Simon. X-ray photography. 22,361. Aug. 25. (Ger., 25.8.26.)

XXI.—Complete Specification

20,115 (1926). I.-G. Farbenind. Manufacture of photographic silver halide emulsions. (258,237.)

XXII.—Applications

Blair, Desborough, Reynolds, Smith, and Thomson. 22,483—4. See IV.

Imperial Chemical Industries, Ltd., and Jenkins. Solvents for nitrocellulose. 22,482. Aug. 26. Nitrocellulose solutions. 22,481. Aug. 26.

XXIII.—Application

Adams-Hydraulics, Ltd., Argent, and Hopwood. Treatment of sewage etc. 22,345. Aug. 25.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Sewage pumping plant (A.X. 5117). *Austria*: Artificial horn, metal, artificial resin, casein and non-inflammable celluloid (178). *British India*: Paper, cresol (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Chile*: Chemists' supplies, rubber goods, glass syphons, raw materials for soap and face powder manufacturers, raw materials for tanners excepting sodium sulphide and anilines (192). *Czechoslovakia*: Tin, lead, antimony (A.X. 5122). *Egypt*: Turbo alternators, boilers (B.X. 3748). *Germany*: Chromium, manganese, tungsten, bismuth, iron and titanium ores (184); raw products for fertilisers (bones, crushed bones, sinews, etc.) (185). *New Zealand*: Insulating material for cold storage, water meters (177); copper welded steel wire (A.X. 5111). *South America*: Stationery (191). *Spain*: Mercury containers (Board of Management of the Almaden and Arrayanes Quicksilver Mines, Madrid). *South Africa*: Insulators (B. 3749).

Safeguarding of Key Industries Act

The Board of Trade have received a complaint, under Section 1, Sub-section (5), of the Safeguarding of Industries Act, 1921, that spectacles, eyeglasses and monacles have been improperly excluded from the lists of articles chargeable with duty under Part I of that Act as amended by Section 10 of the Finance Act, 1926. The complaint will be referred for arbitration to a tribunal consisting of the Referee, Mr. A. A. Hudson, K.C., and of Dr. J. H. Jeans, F.R.S., and Prof. F. A. Lindemann, F.R.S., who have been selected by the Lord Chancellor for the purpose of this arbitration from the panel constituted under Section 10, Sub-section (4), of the Finance Act, 1926. (Cf. p. 812.) Any communications regarding this complaint should be addressed without delay to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, London, S.W.1.

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during August, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 600, of which 505 were from

merchants or importers. To these should be added 16 cases outstanding on July 31, making a total for the month of 616. These were dealt with as follows :—(Granted—540 (of which 521 were dealt with within 7 days of receipt); referred to British makers of similar products—47 (of which 37 were dealt with within 7 days of receipt); referred to Reparation Supplies available—5 (all dealt with within 2 days of receipt); outstanding on August 31, 1927—24. Of the total of 616 applications received, 563, or 91%, were dealt with within 7 days of receipt.

• British Industries Fair

The record of the British Industries Fair for the boom year of 1921 is regarded by the Department of Overseas trade as already broken. According to figures published this week, the space taken for the London section of next February's Fair is now 9,000 sq. ft. more than it was at the White City this year, and, with several months still to run, the combined space booked at London and Birmingham is already only a few thousand feet short of the record. "The astonishing success of the fair," said an official of the Department of Overseas Trade in an interview, "is a solid tribute to the cumulative effect of wide newspaper advertising at home and overseas, and to the patriotic lead which editors everywhere have given the public. The practical business results of last year's fair have led at least 80% of the exhibitors to come in again, and to bring in their wake not only firms which had exhibited in the past and dropped out, but a large number of others quite new to the fair. At this comparatively early date the majority of sections are all bigger than last year. Certain of them, indeed, have now but little space left, and the question whether the increased space available for the next three years will be adequate is already exercising the minds of the Department. The graph of buyers is ascending. Last year the fair was visited by a record number of them, and there is a reasonable certainty of an increase next year. This fact that the fair, as it becomes more and more representative of British industries, attracts year by year more overseas buyers is clearly an invaluable stimulus to overseas trade."

News from Advertisements

A chemist-executive is available for work in connexion with cellulose acetate, allied products and acetate silk (p. vi).

An 18-in. diameter centrifuge is for sale (p. vi).

A highly-trained chemist requires a junior partnership in a chemical concern (p. vi).

Page vii is devoted to a display of advertisements by various Polytechnic Associations.

There are 114 firms represented under various headings in our Buyers' Guide.

Casein Exports of Argentina

During 1926 Argentina exported 19,459 metric tons of casein, valued at an average price of 530 - 550 Argentine paper pesos per ton, an increase of 10% in quantity and 15% in price compared with 1925. Nearly half the export is taken by the United States, and the remainder by Europe.

Scientific Instruments

The Cambridge Scientific Instrument Co., Ltd., is showing a very representative collection of scientific instruments at the Shipping, Engineering and Machinery Exhibition at Olympia (from Sept. 8 to 24). A noteworthy feature of the exhibit is the arrangement of typical groups of instruments mounted on panels as they would be in actual use. Thus, one panel comprises two totally-enclosed indicators arranged for connexion to electrical distance thermometers measuring oil, water, and air temperatures in a turbine and condenser plant, as well as a pressure recorder and a compound gauge. Six illuminated dial CO₂ indicators working in conjunction with a CO₂ recorder are shown in operation: these instruments possess many novel features of considerable interest. A robust dissolved-oxygen recorder, a new apparatus for boiler-house use, is on view, as well as a variety of the well-known Cambridge instruments for measuring and regulating temperature, draught, and pressure gauges, and other instruments for engineering and electrical measurements.

EDITORIAL

Cellulose

WE wish that we were better acquainted with the cellulose industry, its statistics, growth and future. We judge from *The Times* and other newspapers that its future may be difficult. The amount of wood, of paper, of artificial silk, and of explosives derived from cellulose, that man requires, increases year by year; not only does each man, woman and child want more, but the total number of men, women and children is increasing rapidly. Col. Pollitt told us in Edinburgh that at the present rate of increase the whole agricultural area of the world will, a hundred years hence, be inadequate to feed the human race. There are many possibilities in the next century; the present rate of increase may not persist; if we remember Darwin's books aright, the animal kingdom has always been limited by the immediate prospect of starvation; the cabbage butterfly, the earwig, the herring and the cod would speedily fill the whole world if there were only enough food for them: man only, proud, presumptuous man, has so far not filled up his quota, though he very speedily will. We are not greatly concerned about the food supply of man a hundred years hence. As old Merrythought said, "I never came into my dining room, but, at eleven and six o'clock, I found excellent meat and drink o' the table; my clothes were never worn out, but next morning a tailor brought me a new suit: and without question it will be so ever." On the other hand, long before the end of the century, it seems that there may be a great shortage of cellulose. Mr. Raitt, the cellulose expert to the Government of India, tells us that the paper industry and the cellulose industries require now forty million tons of raw wood a year, and will, twenty years hence, require sixty million tons, and that there is no probability of this quantity being available twenty years hence; he tells us that there are immense areas of bamboo forest in India which are a source of cellulose for the paper industry, and that a valuable

bamboo pulp suitable for paper can be made at a cost of about 15 per cent. less than that of wood pulp. If paper goes up rapidly in price, there would be many features to mitigate our disappointment: smaller newspapers, fewer journals, fewer books, fewer circulars, less litter left in streets, railways and the countryside. We can hardly hope for so desirable a result; the probability is that whole masses of vegetable matter, now wasted, will serve as the raw material for treatment by the chemist and the chemical engineer of the future. Time was when the papyrus was necessary to the man of letters; a few pieces of papyrus now divert the tourist in Syracuse, and it has ceased to be of any value; fifty years ago the paper-maker relied on rags; he now relies on wood pulp and esparto grass, and from the esparto grass residues he can make a sort of ebonite or bakelite more durable than paper; we understand that in Italy the esparto grass and its residues are being converted into artificial silk, the conversion of esparto grass into suitable cellulose being effected by chlorine obtained by the electrolysis of common salt. We suppose that esparto grass will have its day, that coniferous wood will have its day, that bamboo may very likely have its day, and possibly other supplies will be tried and found useful, and after some vicissitudes will be replaced by materials now unworthy of consideration. Of two things we are fairly confident; the chemist of the future will, five and twenty years hence, be as full of resource as he is to-day, and that is saying a good deal; we have read, even in this JOURNAL, statements implying that here and there may be found chemists with but little interest in business; we do not remember any statement made which denies their power of organising a piece of technical research and carrying it out with a skill which is really marvellous: this is the first thing of which we are confident; the second is that the chemist, five and twenty years hence, will still read his CHEMISTRY AND INDUSTRY, and that, whether it is printed on cellulose or on some new synthetic

or metamorphosed material, it will be printed in some permanent manner. Our daily news we can have by wireless, that will save twenty thousand tons a year; our parcels can be wrapped up in lead foil, it is desirable to increase the demand for lead; since the hospitals took to collecting lead foil and getting it re-smelted the price of lead has dropped from £30 to £22 a ton; artificial silk stockings will become dearer than natural silk; still the scientific journals, the weekly chemical ones at any rate, will be circulated and kept for reference. We are not sure who first compared the editor, cudgelling his brain for something to say, to the spider producing a thread by spinning its own entrails, but the mention of natural silk naturally brings this saying to the mind, and as one thought leads on to another, it may be suggested that a fresh topic should now be chosen for a fresh effort.

Mathematics in Chemistry

That department of chemistry, and it is an important one, which is an exact science, is necessarily involved with mathematics, and there are very many portions of physical and theoretical chemistry which require a knowledge of algebra, trigonometry, and the differential calculus, and a few in which the integral calculus is necessary. All these varieties of higher mathematics were invented to do with ease what could be done without them only with the greatest difficulty; the elementary stages are easy to learn and, with the exception of the integral calculus, easy to use. The paper we publish this week by Mr. S. K. Tweedy gives an example of an easy way of solving, with an accuracy equal to the errors of experiment, equations of a type common in chemistry, but very difficult to solve by the usual geometrical or algebraical methods. A similar method enables the calculation of logarithms to be easily performed, so easily that at seaside places where there is nothing to do we have often whiled away an odd half-hour by calculating the logarithms of half a dozen numbers to five or six places of decimals. The time was wasted, of course, but so it would have been had we read the latest cricket or racing news. Plotting data on a curve is the commonest method for the chemist to record his experiments, and the deduction of laws from these curves is very easy if one has had enough practice to avoid the obvious pitfalls. The plotting of data is also of the greatest value in industrial chemistry, and in almost every branch of industry; we know nothing to compare with it for recording daily or weekly makes, deliveries, sales, expenses, and so on. A chart of this character can show at a glance how many tons were made last week or since the first of February, how many pages of a journal were printed last week or since the first of January, what they cost for printing or in total, how much profit the manufacturer has made, assuming certain rough figures for overhead charges and so on. Those chemists who desire posts of responsibility in industry might do much worse than spend an hour a week in recording the facts of importance to them and a few hours every summer holiday over Taylor's theorem and the simple mathematical devices of that singular chemist, philosopher, and astronomer, Isaac Newton.]

THE SOLUTION OF MATHEMATICAL EQUATIONS IN CHEMICAL PROBLEMS

By S. K. TWEEDY, B.Sc.

A general method of solving equations of any type should form part of the mental equipment of every chemist. Mathematical equations are continually occurring in technical and research problems, and in the experience of the writer these are solved either by guesswork, graphical methods, or else by simplification into a form amenable to treatment by the elementary methods. Graphical methods are very often applicable, but graph-paper is not always at hand. The object of the present note is to call the attention of chemists to a simple, general, analytical method of solving equations attributed to Newton, and usually named after him.

The theory of the method is very simple. Suppose the equation is $f(x) = 0$, the true solution being x . A solution is estimated; let this be a , and suppose that a differs from x by a small quantity h . Then $a + h = x$. Expanding by Taylor's theorem we have:

$$0 = f(x) = f(a + h) = f(a) + hf'(a) + \frac{h^2}{2!} f''(a) + \dots + \frac{h^n}{n!} f^{(n)}(a) + \dots$$

where $f'(a)$ represents the value of the first differential coefficient of $f(x)$ with respect to x when $x = a$. If h is small enough so that all terms involving it to the second and higher powers may be neglected, then $0 = f(a) + hf'(a)$ or $h = -f(a)/f'(a)$, a quantity which can readily be calculated. Owing to the fact that some of the terms in the expansion have been neglected, the value of h found will be such that $a + h$ is not quite equal to x , the true solution, but it will be nearer than a . The process is continued, therefore, with the found $a + h$ as the estimated solution, and so on, until the correction quantity to be added to the previous approximation is negligibly small. As a rule this stage is reached fairly rapidly, depending on the nearness of the estimated to the correct solution. It is advisable, therefore, to exert a little care in estimating the primary solution. The final result is not affected by an arithmetical error at any stage of the approximation: the time taken to reach the result is increased, however.

Two examples are appended illustrating the applicability of the process, the first one being given in detail. The writer has worked out numerous examples with the aid of the method, and has found that practically the only differential coefficients required in order to apply the process to those equations which arise in chemistry are the following:

$$\frac{dy}{dx} = nkx^{n-1} \quad \log_e x \quad e^x \quad k^x \quad - \quad \frac{1}{x} \quad e^x \quad k^x \log_e k \quad (= 2.303k^x \log_{10} k)$$

where n and k are constants and e is the exponential function. The simple nature of these derivatives tends to render the method simple in application.

Examples.—(1) Let us calculate the temperature at which the red modification of litharge will dissociate in air (cf. Glasstone, *J. Chem. Soc.*, 1921, 119, 1914; Stahl, *Metallurgie*, 1907, 4, 682). The reaction $2\text{PbO} = 2\text{Pb} + \text{O}_2$ is accompanied by the absorption of 100,600 cal. According to Nernst's approximation formula for gaseous equilibria (cf. Partington, "Chemical Thermodynamics,"

p. 226) $\log_{10} K_p = -Q/4.576T + 1.75\sum n \log_{10} T + \sum nC$, where K_p represents the equilibrium constant of the reaction (expressed in partial pressures), Q is the heat absorbed in the reaction, $\sum n$ represents the excess of gaseous molecules on the right-hand side of the chemical equation over those on the left-hand side, and $\sum nC$ represents the algebraic sum of the chemical constants for the gaseous molecules present. In the reaction under consideration $Q = 100,600$ cal., and $\sum n = 1 - 0 = 1$, the oxygen molecule being the only gaseous molecule involved. The chemical constant of oxygen is 2.8, so that $\sum nC = 2.8$, and since $K_p = p_o$ (solids not appearing in the expression for the mass-action constant) we have $\log_{10} p_o = -100,600/4.576T + 1.75\log_{10} T + 2.8$. Since lithium will dissociate in air when its oxygen dissociation pressure equals the partial pressure of oxygen in air ($= 0.21$ atm.) $\log_{10} p_o$ has to be replaced by $\log_{10} 0.21 = -0.678$, and the equation becomes $21980/T + 1.75\log_{10} T + 3.478 = 0$, which has to be solved for T . One method of obtaining the solution is to plot the curves $21980/T = y - 1.75\log_{10} T + 3.478$, the value of T corresponding to the point of intersection giving the required solution. The analytical solution of the equation, according to Newton's method, is carried out as follows.

First estimate a solution. Put $T = 1000$; $f(T) = 13.25$. Put $T = 2000$; $f(T) = -1.74$. Put $T = 3000$; $f(T) = 2.23$. The required solution therefore is between 2000° and 3000°, and is nearer the former. Assume $T = 2250$ for the first approximation.

$$f(T) = 21980/T + 1.75\log_{10} T + 3.478$$

$$f'(T) = 21980/T^2 + 1.75/2.303T$$

$$(i) f(2250) = -9.768 + 5.865 + 3.478 = -0.425$$

$$f'(2250) = 0.00434 + 0.00034 = 0.00468$$

$$f(2250)/f'(2250) = -0.425/0.00468 = -90.8$$

Second approximation $= 2250 - (-91) = 2341$.

$$(ii) f(2341) = -9.388 + 5.895 + 3.478 = -0.015$$

$$f'(2341) = 0.00401 + 0.000325 = 0.004335$$

$$f(2341)/f'(2341) = -0.015/0.004335 = -3.5$$

Third approximation $= 2341 - (-3.5) = 2344.5$.

$$(iii) f(2344.5) = -9.376 + 5.897 + 3.478 = -0.001$$

$$f'(2344.5) = 0.00400 + 0.00032 = 0.00432$$

$$f(2344.5)/f'(2344.5) = -0.001/0.00432 = -0.23$$

Fourth approximation $= 2344.5 - (-0.23) = 2344.73$. The required temperature, therefore, is 2345°K. It is quite obvious that by continuing the successive approximations the solution of the original equation may be obtained to any required degree of accuracy.

(2) As a second illustration let us calculate the molecular volume of carbon dioxide at 60° ($= 333^\circ\text{K.}$) and 25 atm. with the aid of van der Waals' equation. The constants are $a = 3.1 \times 10^6$ atm. \times (c.c.)² and $b = 2.8$ c.c./mol. Expressing v in c.c. and p in atm. (48 in c.c. \times atm.) the equation to be solved is $[25 + (3.1 \times 10^6)/v^2](v - 42.8) - 82.07 \times 333$ or $25v^3 - 2.39v^2 + 3.1 \times 10^6 v - 132.68 \times 10^6 = 0$. A simple calculation on the assumption that carbon dioxide is a perfect gas shows that v is approximately 1100 c.c.m. The successive approximations are:

$$(i) f(1100) = 2189.53 \times 10^6; f'(1100) = 31.37 \times 10^6;$$

$$\text{ratio} = 70.$$

$$(ii) f(1030) = 250 \times 10^6; f'(1030) = 24 \times 10^6; \text{ratio} = 10.4.$$

$$(iii) f(1020) = 13.2 \times 10^6; f'(1020) = 23 \times 10^6; \text{ratio} = 0.6.$$

Hence the required volume is $1020 - 0.6 = 1019.4$ c.c.m. If this is the correct solution, then $f(1019.4)$ should be zero; actually it is 7.4×10^5 . If the approximation is carried a stage further the result 1019.37 is obtained, and $f(1019.37) = -1.43 \times 10^6$, so that the exact solution of the original equation lies between 1019.4 and 1019.37 c.c.m. By carrying the approximation process far enough the exact solution can be reached. In the present example the accuracy of van der Waals' equation does not warrant the calculation of v to more than the nearest c.c.

East London College,
University of London

RAINBOW "SPECTRA"

By ROBERT SAXON, B.Sc.

A converging beam of light is obtained by focussing a vertical illuminated slit upon a vertical test-tube filled with water. It is found that the usual spectra, as described in text-books, are obtained in addition to another caused by "vagabond" rays wandering round

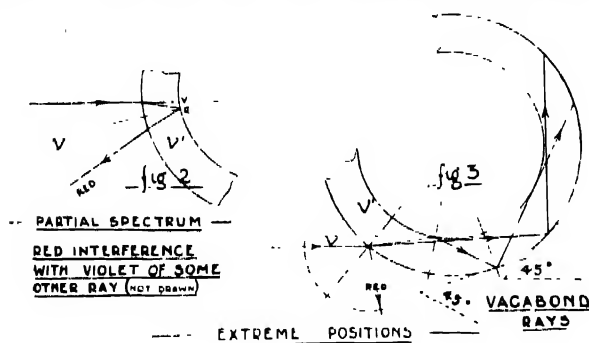

the tube in the glass itself, in zig-zag courses sent from surface to surface like a tramp. Another series of spectra can be obtained by reflected light from the tube when the beam impinges upon the tube in positions between the centre facing the source, and the "glancing" position, where the ray partly enters the glass and as vagabond rays fill the glass with glow, reflecting part of the spectrum.

The "Rainbow" spectrum made by the dispersing water shows absorption bands with coloured salts, and by altering the point of impinging, the length of track and amount of dispersion can be altered at will. Owing to reflection of the beam internally from concave surfaces the spectrum is not narrowed at the red end, as it is with the ordinary prism. The interference of the extreme bands shown in Figs. 2 and 3 (in which the dispersion is grossly exaggerated for purposes of reproduction) is negligible with thin tubes.

The difficulty in these experiments is to obtain tubes of circular uniform bore and thickness, but those supplied to the author by one of the oldest glass-blowing houses in Europe give good results. Air streaks, too, give interference, but when the blower wishes he can avoid these. Better results still will be obtained by forming a tube round a circular mandrel fixed inside a circular hole. The tubes used here are of $\frac{5}{8}$ -in. diameter, flint glass blown as thin as possible—varying from 0.3 to 0.5 mm. Experiments with thicker tubing, such as barometer and combustion tubing, give brilliant spectra, but the bore and thickness are not sufficiently uniform to give pure colours.

Coloured liquids give reflection spectra as shown in Fig. 1. The denser the colour of the liquid and the

brighter the colour in the spectrum in which absorption does not take place: for example, with potassium permanganate red, yellow, early green, and violet are brilliant, but blue and late green are weak. The violet is much longer and more evident than with a prism. In Fig. 1 it will be seen how increasing thickness lengthens out the spectrum according to the law of squares, and that the violet has less opportunity of total reflection than it would have with a prism, just as with the constant deviation block. When the beam impinges too near the axis of the lenses, that is, the middle of the tube facing the source, there is dazzle and reflection interference in this violet. Where mercury is used (after thoroughly drying and cleaning) in the clean warm tube these dispersion colours are very brilliant and produce dazzle whiteness when they interfere with the desired spectrum. Dark liquids (even Indian ink) give the desired spectrum (Fig. 4) without this interference. As such is not the case with flat surfaces it is evident that the cylinder has greater reflexive oscillatory power on a ray than a flat surface. The attendant rays on either side of any one ray under consideration may have a swing-over dynamic effect on that ray, and one is more normal to the surface than the other, except

when the beam hits the cylinder to pass through its axis. The one more nearly normal must have some decisive effect upon the ray which is not balanced on the other side.

Fig. 4 shows the desired means of producing spectra. A converging beam with imaginary focus and centre of

spherical wave fronts at f . The reflected ray from a interferes with that following path cd and the difference in phase represented by

$$(cd + db)/v' - ab/v$$

where v is the velocity in air, and v' that in glass of the rays, can be arranged or determined by the magnitude of c and t (thickness) along with the convergent angle.

Any part of the spectrum can be studied without the others, and photographic plates suited to these parts used. When the convergent angle covers as little as possible of the tube the light is monochromatic, and polarised.

CHEMISTRY AT THE BRITISH ASSOCIATION MEETING

Very few of those attending the meeting and immediately interested in the work of Section B will agree with the Special Correspondent of *The Times*, who gave it as his opinion that "There is a general impression of an arduous, overcrowded, and somewhat flat meeting. The proceedings in Section B were mildly arduous, they were not overcrowded, and the term "somewhat flat" could not be attached either to the intellectual standard of the proceedings or to the generous Yorkshire hospitality which the chemists received.

Dr. N. V. Sidgwick, F.R.S., whom we congratulate on having received the honorary D.Sc. degree of the University of Leeds, did not formally read his Presidential Address, but opened a discussion on Thursday, September 1, on the subject of his address, "Co-ordination compounds." Dr. Sidgwick's stimulating power of co-ordinating chemical facts and showing how these can be explained by our present knowledge of the structure of the atom is well known. His Presidential Address has already been printed in this JOURNAL (CHEM. & IND., September 9, p. 799), and we venture to believe that it will be regarded as a classical contribution to the subject. It was clear from the discussion, in which Professor G. T. Morgan, F.R.S., Professor C. K. Ingold, F.R.S., Dr. S. Sugden and Dr. F. G. Mann, all well-known workers in this field, took part, that although complete harmony among prevailing views has not been arrived at, we can even now appreciate the far-reaching importance to all branches of chemistry of the work on co-ordination compounds.

On the same afternoon Mr. A. T. King read a paper on "The chemical aspect of wool research," and an opportunity of seeing something of the work at the British Research Association for the Woollen and Worsted Industries was given.

On Friday, September 2, the chemists and physicists held a joint discussion on "The structure and formation of colloidal particles." Sir William Bragg, F.R.S., indicated with his characteristic clearness the information which the use of X-ray analysis had already given as to the constitution of colloid particles. Prof. Freundlich's contribution followed that of Sir William Bragg most happily, and Prof. Freundlich was welcomed not only as one of the foremost workers in this field, but as a friend: he received a great ovation. The work going on in the University of Leeds was described by Prof. R. Whytlaw Gray and Dr. F. L. Usher, and we had a communication from Sir James Walker's Laboratory by Mr. B. N. Desai and another from the Physics Laboratory at Leeds from Mr. J. Ewles.

It would take too long to describe adequately here the discussion on "The chemistry of hormones," on Monday, September 5. Prof. G. Barger, F.R.S., gave an excellent survey of the whole field, and described the useful rôle which the chemist has played and can play in the investigation of these "stirrers up" of physiological processes. Whether one considers the cases of adrenalin or thyroxin, whose chemical constitution is, in each case, now known beyond doubt, or the more difficult cases of insulin, secretin, the ovarian or the testicular hormones, the work of the chemist follows that of the clinician and the physiologist. Prof. H. S. Raper discussed the possible explanation of the activity of adrenalin: a wonderful chemical lecture by an eminent physiologist. Prof. J. C. Drummond emphasised the necessity of appreciation by chemists of the practical difficulties of working on such substances as the hormones and vitamins which possess such enormously high physiological activities: he described in detail work in progress at University College by Dr. A. S. Parkes on the ovarian hormone which has recently been shown to contain two substances one of which is active or dominant during oestrus and the other active during pregnancy. Prof. E. C. Dodds directed attention also to the ovarian hormone. When prepared by alcoholic extraction it appears to be an oil the distillation of which in high vacuum is extremely difficult.

Prof. J. Mellanby's interesting account of secretin indicated that there is some hope that the chemical nature of secretin will be revealed before very long in spite of the difficulties attached to the work. Drs. Seligwick, Simonsen, Henry, and Channon all took part in the discussion, and although Mr. F. H. Carr unfortunately could not be present (owing to a family bereavement), he sent a communication regarding the purification of insulin by crystallisation, on the lines of Prof. Abel, whereby an insulin possessing an activity of $3/2$ times that of insulin purified by ordinary methods has been obtained in small-scale experiments.

On Tuesday, September 6, five papers were communicated. Prof. H. M. Dawson dealt with "New developments in the study of acid catalysis," Prof. John Read with "Researches on menthones, menthols, and menthyl-

amines," Mr. W. A. Wightman with "Multiplanar rings and some consequences of strainless motion," Dr. W. Wardlaw with "Co-ordination compounds of molybdenum," and Dr. J. A. V. Butler with "The effect of an electric field on the adsorption of ions at the interface of mercury and neutral solutions of electrolytes."

The sectional excursions to the works of Messrs. Wood Bros. Glass Co., Barnsley (Thursday), to Messrs. The Yorkshire Coking and Chemical Co., Ltd., and Messrs. Hickson and Partners, Ltd., Castleford (Friday), to Messrs. L. B. Holliday and Co., Huddersfield (Monday), and to Messrs. Joseph Watson and Sons, Ltd., Leeds (Tuesday), were extremely well attended. The parties were most hospitably entertained, and no trouble was spared in making the visitors acquainted with the work.

For Section B, the Leeds Meeting of 1927 will be memorable, and its success very largely depended on the efforts of Mr. H. S. Patterson, the efficient, energetic and genial Local Secretary.

MOLER PRODUCTS, LTD.

A large party was present at the opening, last week, of the first unit of the plant which Moler Products, Ltd.,

Behind is the cutter for the slabs as extruded from another machine under pressure. The cut slabs pass on to a rack that assumes a perpendicular position for conveyance on light rails to the kilns

has erected at Hythe, near Colchester, for the manufacture of constructional and insulating materials from diatomaceous earth. The factory is situated on the banks of the Colne, and represents, together with the

source of supply of the raw material in Denmark, a British investment of some £400,000. The lay-out of

slabs. They are stated to have efficient sound, heat and cold insulating properties; they are about one-third

A 2000 ton dump of Fosalsil with the telpher and belt conveyor

the works appears to have been admirably conceived, the latest types of plant and labour-saving devices have been installed, and ample provision is made for expansion.

After the official opening, the guests first inspected the storage dump at the wharf, where 5000 tons of the diatomaceous earth is stored. From the dump a belt conveyor, capable of handling 100 tons per hour, carries the earth to the separating plant in which stones and other undesirable material is removed. From here some of the material passes through processes which convert it into a cement for coating steam pipes etc., whilst some is conveyed on a belt to hoppers, each capable of storing 45 tons. From the hoppers the material is delivered to mixers, in which it is converted into a plastic mass with the aid of water, and is then passed to brick-making machines, which force it through a die under heavy pressure. The extruded slabs, now shaped, passes over a cutting table, which measures and cuts off the length of brick required irrespective of the speed of the delivery. The shaped bricks are loaded automatically on to conveyors and passed to the drying chambers. From the drying chambers the bricks are transferred to the kilns, where they are fired at a temperature of 880°C ., control being by means of cones as well as by distant recording Cambridge pyrometers. The kilns are situated on a raised platform provided each side with railway sidings, so that the bricks, when cooled off, can be loaded directly into trucks with a minimum of trouble. The boiler plant, the gas-producer, and the electricity plant are all of the best of their kind. Waste-heat recovery is practised in the most approved fashion.

The materials thus manufactured from diatomaceous earth, are marketed by J. H. Sankey & Son, Ltd., of Canning "Town, under the trade name of "Fosalsil (Moler)," and are supplied in the form of solid or hollow partition blocks, or as porous solid insulating bricks and

lighter than ordinary clay products, and in the form of hollow partition blocks have a crushing strength of

Elevator for pressed partition slabs and bricks to the floor level of the kilns

about one half ton per square inch. A test carried out under working conditions in a gas works showed that the temperature of an uninsulated 14-in. wall of retort setting of ordinary firebricks was $195^{\circ}\text{C}.$, but when insulated with "Fosalsil" Moler porous insulating brick the temperature was reduced to $70^{\circ}\text{C}.$, and when insulated with Moler solid-insulating brick to $92^{\circ}\text{C}.$ Figures were supplied showing the efficiency of Moler cement used as a covering for steam pipes, boilers, etc.

Speaking at a luncheon which followed the visit, the chairman of the Board, Mr. J. A. Agnew, said that at present the plant was mainly producing building materials, but the Board felt that the company could soon play a very important part in the production of insulating products, mainly for power and gas plants.

THE SHIPPING, ENGINEERING AND MACHINERY EXHIBITION

The twenty-first Shipping, Engineering and Machinery Exhibition now being held in Olympia contains such a wide variety of exhibits that it will well repay a visit. Unless the visitor is specially interested in one particular branch of engineering, several visits could profitably be made before he could become familiar with all the exhibits which are worthy of attention. Some idea of the variety of the exhibits may be obtained from the following brief summary. Several stands are devoted solely to metals and materials used by the engineer, whilst another group shows developments in machine tools, and a third group exhibits various scientific appliances for measuring steam and water, automatically recording carbon dioxide in flue gases, measuring and controlling temperatures, and the treatment of feed water for boilers. Quite a number of stands also show pumping machinery, and illustrate the handling of solid materials. The separation of foreign matter from liquids, such as oils, either by filtration or by centrifuging can be studied. Furnaces, electric and coal-fired, are also on show. On the optical side one can examine pyrometers, range-finders, binoculars, photomicrographic apparatus, section-cutting apparatus, and so on. The gradual application of the internal-combustion engine for marine work is in evidence on several stands, whilst others show types of these engines suitable for land purposes. Another interesting feature is the number of stands taken by shipping companies, which illustrate the facilities they offer for transport. Power-transmission is also brought to the notice of the visitor, for numerous stands exhibit reduction gears, whilst others show belts, belt fasteners, and materials for treating belts to prevent slipping. Oxy-acetylene welding and cutting in air and water, and spray painting are also among the many interesting exhibits. The methods adopted by the organisers of the Exhibition seem to be on the right lines, since arrangements have been made for over 40 different scientific bodies to pay official visits to the Exhibition, thereby bringing their members into contact with the latest engineering developments. The Society of Chemical Industry paid its official visit on September 13, when the President, Mr. F. H. Carr, C.B.E., the Council, and the members were the guests of the organisers.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICE

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready. The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

CALENDAR OF FORTHCOMING EVENTS

Sept. 20, 21, and 22.—IRON AND STEEL INSTITUTE. *Glasgow Meeting.* Royal Technical College, Glasgow, commencing each day at 10 a.m. (See CHEM. AND IND., Sept. 2, p. 786.)

Sept. 22.—INSTITUTION OF THE RUBBER INDUSTRY. *Manchester and District Section.* Geographical Society, St. Mary's Parsonage, Manchester. Annual General Meeting, to be followed by a discussion which Mr. H. C. Young will open on his paper "Production methods in a rubber factory."

Sept. 23 to 26.—ASSOCIATION OF SPECIAL LIBRARIES AND INFORMATION BUREAUX. Fourth Conference, Trinity College, Cambridge. Amongst the papers to be read are the following:—"The necessity for uniformity in the cataloguing of periodicals," discussion to be introduced by Dr. W. Bonser, Mr. J. F. Pownall, and Miss H. A. Ball. "Recent developments in connexion with the science library, South Kensington," by Col. Sir H. G. Lyons. Brief statements will be given on the work of the International Institute of Intellectual Co-operation (Paris), the International Institute of Bibliography (Brussels), the World List of Scientific Periodicals, etc. "Rationalisation in industry," by Major L. Urwick. "Forecasting of industrial and trade tendencies; the function of statistics in modern industrial organisation," by (a) H. Quigley and (b) W. Wallace. "Trade information and statistics in Great Britain as compared with other countries," by A. E. Overton. Papers dealing with patent classification, and the methods of searching patent specifications in Great Britain, Germany, and the United States, will be given. "Information bureaux and liaison with national and local libraries," by A. F. Ridley. "Special library from the administrative standpoint, with special reference to methods of indexing and filing," by P. K. Turner. "Information bureau in relation to the consultant," by Dr. J. C. Withers. Discussion on "New methods of photographic reproduction as applied to printed and MS. material." "A panel of expert translators"; discussion to be introduced by Dr. R. S. Hutton. "Standards of book selection in science and technology," by Sir Richard Gregory, followed by a discussion. (See CHEM. AND IND., Sept. 2, p. 788.)

Sept. 26 and 27.—CERAMIC SOCIETY. *Refractory Materials Section Meeting.* Town Hall, Bournemouth, commencing at 10 a.m. each day. The following papers will be read:—"A consideration of steel works refractories," by A. T. Green. "Note on silica bricks made without added bond," by W. J. Rees and W. Hugill. "Some experiments in the drying of clays," by R. S. Troop. "Crushing strength of unfired fire-clay bodies," by W. C. Hancock. "Determination of iron silicates," by A. E. J. Vickers. "Refractory material used as mortar for laying up refractories," by Prof. D. A. Moulton. "Characterisation of clay," by Dr. A. F. Joseph. Discussion to be opened by S. R. Hind. "Effects of temperature on the mechanical properties of silica products," by A. J. Dale.

INTERNATIONAL SOCIETY OF LEATHER TRADES' CHEMISTS

In connexion with the Conference in London during the week commencing September 12 of the International Society of Leather Trades' Chemists, a luncheon was given on September 12 at the Connaught Rooms by the United Tanners' Federation of Great Britain and Ireland and the Federation of Curriers, Light Leather Tanners and Dressers. Mr. A. P. Preston, President of the United Tanners Federation, was in the chair.

Proposing the toast of "The International Society of Leather Trades' Chemists," the chairman said the Society was formed 30 years ago, and one of the founders was the late Professor Procter, whose recent death was so much regretted. Professor Procter was a pioneer of chemistry in the leather trade. Remarkable progress had been made in the leather trade during the 30 years the Society had been in existence. Chemical control was almost unknown in those early days, but to-day there was hardly a tannery in the country that was not controlled by chemists, and the Society could take a full share of the credit for this advance.

Professor D. McCandlish (President of the International Society of Leather Trades' Chemists 1926-7) said the Society at times had been subjected to a good deal of criticism which on occasion was not well directed. Leather chemists had tough hides, and were not hurt by honest constructive criticism, but a good deal of criticism had centred around the question of hide powder, and some of it was neither well directed nor deserved. Leather chemists appreciated that there was a good deal of irritation in the tanning and extract trades over the hide powder problem. This had been taken under the wing of the Society, in a quite altruistic manner it had taken on the question of the production of hide powder supplies, thinking it was going to do something which would be appreciated by the trades concerned, but the Society had been roasted and toasted over the matter for years. Nevertheless, the Society had made honest efforts to clear up the position and to serve the trade. It had no funds for paying research workers; indeed, it had a deficit of £150 last year, but it had a number of earnest volunteer workers who had been doing valuable work, and he believed it could be said that these volunteer workers had shown the way to a solution of the hide powder problem, and that in the not too distant future hide powder worries would be a thing of the past.

Dr. A. Gansser (Past President of the International Society of Leather Trades' Chemists) proposed "The Leather Trades' Federations," and put in a plea for collaboration and co-operation between all branches—the leather chemists, the tanners, and the extract people.

Mr. Harry Holder (President of the Federation of Curriers, Light Leather Tanners and Dressers) who responded, subscribed to that plea, and expressed the hope that leather chemists would be able to do something to make the leather trade somewhat more profitable than it had been in the past.

The final toast was "Allied Societies" proposed by M. U. J. Thuau (Hon. General Secretary, the International Society of Leather Trades' Chemists). He said the Conference marked a stepping stone in the path of

progress of research leather chemists, and one of the greatest achievements of the Conference was the acknowledgment of a new international method of tanning which could be applied in every country of the world. He coupled the toast with the name of the President of the Society of Chemical Industry, Mr. F. H. Carr, C.B.E.

Mr. Carr, in his response to the toast, said that those in the Society of Chemical Industry believed that the progress of all industry is dependent on the progress of chemistry. Progress in chemistry, in its turn, was dependent on the progress of its interdependent parts, and those taking part in this Conference were promoting the progress of the leather industry in a manner which set an example to all the other branches of chemical industry. By coming together as leather chemists had done on this occasion they were doing very much to promote the science on which the progress of the leather industry depended. The progress of knowledge, however, was of value only as it promoted human happiness; that was the real test of research in the end. He would always maintain that the progress of the world in peace depended on the extent to which we can use knowledge to advance the happiness of the workers and the people of the country generally.

CORRESPONDENCE

THE COLLEGE MAN AND CHEMICAL INDUSTRY

SIR,—Recent correspondence under this heading which has appeared in the last few numbers of this JOURNAL appear to me to neglect one important point, viz., the attitude of the employer.

The usual questions put to the "raw" university graduate seeking employment are:—

1. Did you get a "First"? (Which means are you a quite exceptional case where pure science alone is concerned?)

2. Will you come for "x" £ per week? (Where "x" is usually the lowest integer he can think of and works out at perhaps 2s. or 3s. per week more than the wages of the man who sweeps the floor.)

Consequently, (1) drives men, while at college, to strive after that elusive "honour," thus leaving no time, energy, or inclination for economics and the like, and (2) drives them East to become rubber planters.

If the manufacturer will create the demand, which means nothing more than offering reasonable salaries for the right "type," surely the supply will be forthcoming. Especially must this be so when an "article" so close to the desired "article" as the college man is, already exists.

Therefore, Mr. Editor, I feel that, like the steel industry, what the manufacturer needs is a little "self-help" and a cheque-book.

Yours faithfully,

Bickley, Kent

W. HENRY STEVENS

A SUGGESTION

SIR, In the current issue of CHEMISTRY AND INDUSTRY, you ask for a new word in place of "hydrogen ion concentration." In the next sentence you suggest one. Why not "hiocon"? Insist on its use in the JOURNAL and it will doubtless find favour—at any rate with the compositors.

Yours faithfully,

H. V. HODGSON

PERSONAL AND OTHER ITEMS

It is with deep regret that we announce the death, at the age of 85, of Mrs. Carr, the mother of the President of the Society, Mr. F. H. Carr, C.B.E. Throughout her life Mrs. Carr was conspicuous for her kindly actions, and she was busy and active until the last. She leaves a fairly large family to mourn her loss. General sympathy will be felt for the President and his family in their sad bereavement.

At the Congregation of the University of Leeds, held last week, the Chancellor, the Duke of Devonshire, announced that Col. Sir Edward Brotherton had given £100,000 to defray the cost of the new University Library. In conveying the University's profound appreciation of this magnificent benefaction, the Chancellor said the library, when built, would be permanently associated with the name of Sir Edward Allen Brotherton. Sir Edward, who is head of the well-known chemical manufacturing firm of Brotherton & Co., Ltd., has given generously to Leeds institutions, and has never been sparing in his public service.

Sir William Bragg, F.R.S., has been elected president of the British Association for the year 1928-29.

Mr. E. Gurney Buxton has been elected to the board of Callender's Cable & Construction Co.

Mr. Harold Cox has been appointed a director of the Calico Printers' Association, in place of the late Lord Emmott.

The University of London has conferred the degree of D.Sc. on Dr. S. Judd Lewis for a thesis on "Spectrophotometry in relation to chemistry."

Prof. Charles Weizmann, D.Sc., the well-known chemist, has been re-elected President of the Zionist organisation.

At the International Congress of Physics, held at Como, in connexion with the celebration of the centenary of Volta, the British delegates were Dr. F. W. Aston, Prof. W. L. Bragg, Prof. A. S. Eddington, Prof. J. A. Fleming, Prof. O. W. Richardson, Sir Ernest Rutherford, and Sir J. J. Thomson.

Mr. W. T. Chadwin has succeeded Mr. A. Wood as Secretary to the British Sugar Beet Society.

The death is announced of Mr. J. Taylor, chairman of British Insulated Cables, Ltd., and a director of the British Aluminium Co., Ltd., and other companies.

The death is announced of Dr. A. Jonas, factory manager to the I.-G. Farbenindustrie A.-G., at Leverkusen.

Dr. T. Fischer, chemist to the Westfälisch-Anhaltische Sprengstoff A.-G. Chem. Fabriken, has died aged 62.

The late Mr. T. W. Stainer Hutchins, managing director of the Electro Bleach and By-Products, Ltd., Northwich, left £38,477, with net personalty £36,375.

Chemical Combines

Sir Alfred Mond, in the course of an interview published in the *Morning Post*, said that he had seen it suggested "that an agreement is in contemplation between the Imperial Chemical Industries and the German Dye Trust, which might tend to favour Germany as far as

manufacture is concerned, and leave this country in a state of inferiority in time of war, and its chemical industry in an inferior position." "Nothing could be more incorrect. I can state emphatically," continued Sir Alfred Mond, "that we do not consider the British chemical industry to be in any way inferior to the German industry. We, in England, can produce synthetic ammonia quite as cheaply as the Germans. Further, our costs of production of chemical products are as low as, if not lower than, in other countries. Far from it being in our minds to conclude any agreement which would tend to give advantage to Germany at the expense of Great Britain, the whole trend of any discussion has been to get for the British Empire such advantages of new inventions as synthetic oil, and to form a harmonious mutual interchange of inventions, processes, and ideas of which we have as many as any other country. As far as national security is concerned," he concluded, "the present Imperial Chemical Industries is formed of firms who were responsible for the chemical supplies in the late war, and it should be remembered that we supplied both our selves and our Allies with explosives and gas at a very short notice. In point of fact, this country is far better off to-day for explosives than it was in 1918. Our British combine is in close touch with the Government, but in my opinion it would be contrary to all conservative doctrines to expect a trading concern to submit its plans and arrangements for sanction to any Government department. Such a course would paralyse all business activity, and put quite an unreasonable responsibility on the Government officials."

"Our negotiations with the German Dye Trust are in no way sensational. There can be no question of amalgamating, but only of discussing points of common interest, which has been the practice of every great firm or combine in the world."

Sir Max Muspratt, speaking at Liverpool recently, said that he was convinced that those industries which had combined for mutual improvement would be able to show an increase in the total employment and a reduction in the price to the consumer. Under a sound system of rationalisation, it was the duty of manufacturers to absorb the workers displaced by improved industrial methods.

New Device for Degreasing Machine Parts

Considerable interest attaches to a British invention which has been taken over by Imperial Chemical Industries, Ltd. The invention, known as "Crawshaw's chemical colander," consists essentially of a tank, in the bottom of which a special chemical known as "Crawshawpol" is placed. The chemical, which boils at a very low temperature, is heated by such means as may be available. In the upper portion of the tank there is a condensing coil, through which cold water circulates. The parts of machinery to be degreased are placed in the tank, which may vary in pattern and size to suit any class of article, small or large. On heating, the chemical begins to vapourise, the vapours being condensed by means of the condensing coil. The result is a shower bath of "Crawshawpol," which literally eats the grease off the metal parts. In a very few minutes the heating apparatus may be turned off and the tank opened, when

the parts will be found to be dry and absolutely free from grease, all that is then necessary being the use of a soft brush or air blow to rid the surfaces of dry dust.

After the chemical has dissolved and washed away the oil and grease from the work it falls back to the supply at the bottom. Here the grease is locked, and the continuous boiling of the chemical will not vapourise the oil, because it has a considerably higher boiling point than the chemical itself so that once the oil is down in the bottom it will never get back on the work. It is stated that the saving in suitable instances by the use of this colander cuts down labour times from as much as a full day spent in cleaning a whole machine to a matter of a quarter to half an hour, and that the general average of labour time saved is the difference between $1\frac{1}{2}$ to 2 hrs. cut down to 3 or 4 min. The invention is exhibited at the Shipping, Engineering and Machinery Exhibition, and probably will also be shown at the Public Works, Roads and Transport Congress and Exhibition.

Explosion at Cordite Factory

Three men were killed in an explosion at the Royal Naval Cordite Factory at Holton Heath, Dorset, on September 10, whilst they were working on an acetone recovery pipe. It is thought that some nitro-glycerin got on a screw, and that when it was turned the nitro-glycerin exploded.

Sir John Cass Technical Institute

The new session of the Sir John Cass Technical Institute, which extends over about 36 weeks, begins on Monday, September 19, and students will be enrolled on September 14, 15 and 16, from 6 to 8.30 p.m. The Institute, which is one of the London Polytechnics, provides instruction in pure and applied mathematics, physics, chemistry, the fermentation industries, petroleum technology, gas manufacture, metallurgy, mining, modern languages, arts and crafts, etc. In order that those who are engaged during the day may have the opportunity of obtaining an adequate education, the courses of instruction, which meet the requirements of those engaged in chemical, metallurgical, electrical, petroleum, and the fermentation industries, and in artistic crafts, etc., are held from 6 to 10 p.m. Full facilities are provided in the well-equipped laboratories of the Institute for special investigations and research. The instruction in experimental science also provides systematic courses for the examinations of London University and the Institute of Chemistry.

Gas Industry in Conference

Gas undertakings in all parts of the country will be represented at the Sixteenth Annual Conference of the British Commercial Gas Association, to be held in Southampton from Monday to Wednesday, October 3 to 5, under the Presidency of Sir Russell Bencraft, M.R.C.S.E., J.P., Deputy-Chairman of the Southampton Gaslight and Coke Co. Matters of public health will figure prominently in the discussions. Not only is Sir Russell Bencraft a medical man, and likely to survey the gas industry's contribution to public health in his Presidential Address, but on the evening of October 4, at a Mayoral Reception in connexion with the Conference, Sir Bruce Bruce Porter, K.B.E., C.M.G.,

M.D., one of the founders of the New Health Society, will lecture on "New health; the importance of health in industry." Other subjects are to be dealt with by Miss Gladys Burlton, Principal of the Burlton Business Institute, who is to speak on "Salesmanship in the showrooms," and by Mr. Ralph Halkett, General Manager of the Sheffield Gas Company, who will read a paper on "The commercial prospects and future co-operation of the gas industry."

Tinplate Pooling Scheme

The Welsh tinplate pooling scheme is to be abandoned, as no revival in the Welsh industry has followed its operation, owing to foreign competition. The pool was formed by a general contribution, and under the scheme, works without orders drew from it, and it was hoped thereby to regulate output and prices.

International Zinc Cartel

It is reported from Brussels that negotiations for the establishment of an international zinc cartel have been initiated by leading producers in Germany, Great Britain and Belgium. No great enthusiasm appears to be felt for the project.

Chemical Trade of the United States

During the first six months of 1927 the value of exports of chemicals and allied products amounted to \$97,188,000, an increase of 15% over the first six months of 1926. The imports, consisting mainly of crude and semi-manufactured products not indigenous to the United States, amounted to \$103,936,000, being 11% below those of the corresponding period in 1926. The improvement in exports was general in most of the groups, the largest, 97%, being in coal-tar products—especially in crudes. Increases were also notable in industrial chemicals and pigments and paints. There was a marked drop in the prices of rosin and turpentine. Exports of rosin amounted to 625,500 barrels (compared with 491,200 barrels during the corresponding period in 1926), whilst exports of turpentine amounted to 5,957,000 gals., against 3,724,000 gals. There was a large increase in the shipments of sulphur to Australia, France, Germany, the Netherlands and the United Kingdom also purchased considerably more during the first half of 1927 compared with the same period in 1926. Creosote oil was the largest single import. There was an increase of 16% in the purchases of colours, dyes, and stains, and a growing demand from foreign consumers for American insecticides, disinfectants, deodorants, etc. Imports of citrate of lime decreased from 2,318,000 lb. in the first six months of 1926 to 155,000 lb. during the same period of 1927. Although more refined glycerin was purchased from abroad, less crude came into the country. The largest export increases in the pigment, paint, and varnish group were in carbon black, which gained 25% in value and 14% in quantity, and in varnishes other than oil including lacquers. Exports of ammonium sulphate increased one fifth in quantity shipped to a total of 84,000 tons, the Netherlands East Indies affording the best outlet, with Japan second. The decrease in imports of fertilisers continued throughout the first half of 1927 until only two thirds as much was received compared with 1926, the most important decline being in sodium nitrate.

Carbon Black in the U.S.A.

The output of carbon black from natural gas in the U.S.A. in 1926 was 180,576,176 lb. (\$9,939,221), an increase of 2%. Sales totalled 167,304,710 lb., a decrease of 5% compared with 1925; 49.2% of the sales went to the rubber industry, 12.7% to ink, 6.7% to paint, 6.8% to miscellaneous uses, whilst 21.6% (39,210,389 lb.) was exported, Great Britain being the chief customer, followed in order by France, Canada, and Germany. Most of the production was made by the channel process.

The I.-G. Farbenindustrie

Application has been made by the German Dye Trust to the railway authorities for the transport of synthetic oils at a cheaper rate, the loading stations named in the application being Leuna, Ludwigshafen and Kötchen. From this it is concluded that the Trust's experiments at the Leuna works near Merseburg have been successful, and that the new synthetic fuel will shortly be placed on the market. It is also thought that coal distillation plants have been established at Ludwigshafen and Kötchen.

German Industry

Official statistics of the profits of limited liability companies in Germany in 1926 show that those engaged in the chemical industry (including the I.-G.) made average gross profits of 12.1%, the average net profits being 5.4%. In other branches, the gas, water, and electrical companies made 12.9% gross, 8% net, the paper industries 13.9% gross and 6% net, and the mining industries 11.6% gross and 6.2% net.

Speaking at the annual meeting of the Federation of German Industry on September 2, the chairman, Dr. Duisberg, said that the number of unemployed in Germany had decreased during the past year from about 1,500,000 to 576,000, the gain being confined chiefly to industries supplying the inland markets. In 1925 and 1926 the adverse balance of trade amounted to about £200,000,000, which would probably be exceeded during the current year. New debt totalling about £500,000,000 had been incurred during the last three years. Germany had to pay at least £225,000,000 a year in interest, which was more than double the pre-war figure. He impressed upon the meeting the need for economy in all branches of industry and for manufactures of first-class quality. It was essential to have healthy industrial, financial and social policies, and he warned them against the pursuance of a dangerous credit policy. In support of his statement that German industry as a whole was not as sound as might be expected, Dr. Duisberg said that of the 850 companies registered in Berlin during 1926, 309 had paid no dividends, and the average dividend paid by the others was only 6.88% compared with 10.02% in 1913. One of the chief reasons for this was that the wages of skilled workers had increased by 47% and unskilled by 81% since 1913.

An Enquiry

A correspondent wishes to get into touch with manufacturers of pectin for jelly making. Replies should be addressed to The Editor, CHEMISTRY AND INDUSTRY, 46—47, Finsbury Square, E.C.2.

REVIEWS

COAL CARBONISATION, HIGH AND LOW TEMPERATURE.—

A TREATISE ON THE PRINCIPLES AND PROCESSES OF MANUFACTURING COKE AND SEMI-COKE. By JOHN ROBERTS. Pp. xvi + 406. London: Sir Isaac Pitman & Sons, Ltd., 1927. Price 25s.

This is on the whole a well-designed and useful book. It begins with a rather sketchy chapter on the origin of coal, followed by two on the origin of anthracite. The author holds definite views on this subject, which he develops at considerable length. Not everyone will agree with him, or with his contention that knowledge of the mode of production of anthracite is of vital importance to the coke maker; but the chapters are full of interest. After a chapter on "Why coal should be carbonised" comes a series of chapters on coking and non-coking coals, the coking process, and the factors which influence or modify the coking quality—pre-heating, partial oxidation, the blending of coals, the effects of moisture, of compression, and of briquetting. Seven chapters on low-temperature carbonisation and eight on high-temperature carbonisation follow, in which are given descriptions, with diagrams, of the chief forms of retort or oven that have been or are in use; then three chapters on gas-works practice, one on the production of "semi-coke" (easily ignitable coke) in coke-ovens or gas-retorts, and a short account of the cognate processes of Bergius, Patart, and Fischer.

The purely descriptive portions of the book (and these form the greater portion of it) are very well done. The other portions are for the most part interesting to read, though they suffer from drawbacks which might readily be removed in a future edition by a little care. The author is an enthusiast, and perhaps carries his enthusiasm a little far for a textbook. He is of the school which holds that all bituminous coal should be carbonised, and draws a picture of the "All-embracing coal-mining enterprise" in which all coal brought to bank is carbonised; but he indicates one of the strong arguments against the practicability of universal coking treatment when he suggests that *as much as would be economically practicable* of the by-products should be worked up into finished products. What of the portion which it is not "economically practicable" to deal with, and how large would that portion be?

The drawbacks I have mentioned are, first, a lack of arrangement, and consequently of conciseness—within three pages, for instance, we are told three times that a strongly-coking coal carbonised at a low temperature will stick to the walls of the retort; and, second, a frequent looseness and inaccuracy of language, far too common in technical works, which at times puzzles the reader, and at times annoys him and distracts his attention from the matter. Early in the book the author distinguishes between those coals which yield smoke when burnt as they usually are, and those which do not. With the words "Smoky" and "Smokeless" at command, it would seem unnecessary to go further; but if other descriptive words are to be used, surely it would have been difficult to find less appropriate ones than "proximate" and "ultimate," which have entirely other meanings, and have no connexion whatever

with smokiness. In another place we find that a *prospect* is within measurable distance of becoming a *proposition*. The author has plenty of company when he speaks of "In the region of" or "In the neighbourhood of," where people in general say "About," just as the American will write "In the event that" where "If" is meant; but the shorter form is greatly to be preferred. This kind of thing is very frequent, and the book would be greatly improved if the author would edit it carefully in regard to orderly arrangement and choice of language. In spite of these blemishes and looked at broadly it is a book heartily to be commended.

One protest I must make, however. It is sad to think that any Briton, having that good and honest word at his command, should in serious discussions, designate his fellow countrymen by the objectionable, vulgar sounding, Yankee slang term "Britisher." I hope Mr. Roberts will gratify me by expunging that term from the second edition, an early call for which I am sure his book deserves.

J. T. DUNN

THE OIL AND COLOUR CHEMISTS' HANDBOOK. Translated from the German by W. H. HILTON-BROWN. Pp. 176. London: The Trade Papers Publishing Co., 1927. Price 10s. 6d.

This little book, which is a translation of the "Taschenbuch für die Farben- und Lackindustrie" by H. Wolff and W. Schlick, is interesting as a sidelight on the German paint and varnish industry, with which the activities of the authors have for so long been connected.

In Part I, pigments, oils, resins and solvents are covered, but the section describing the properties of pigments is hardly adequate. No blacks are included, except for a passing reference to "soot," and, judging from the information given, it would appear that the pigments in general use in Germany are distinctly inferior to those employed in this country.

Part II contains, considering the short space available, a good description of various varnishes and driers and their manufacture according to German practice. The section on cellulose ester varnishes is somewhat behind the times, but this is doubtless explained by the fact that, when the book was written, interest in these materials had not awakened in Germany to the extent which it has since done.

Part III can hardly be considered as an adequate summary of information on oil paints and enamels, even for a short handbook of this description; but the general schemes of analysis included in Part IV form a useful supplement to the methods of examination described in the earlier sections.

Taking into account its many good features, it is a pity that the book has suffered so much in translation. It is evident that the translator, although he has carried out his work conscientiously, has been handicapped by a lack of knowledge of the paint and varnish industries, with the result that the English equivalents of German technical terms have not always been quite happily rendered. It is to be hoped that in subsequent editions of the book an opportunity will be given for a paint chemist to overhaul, and where necessary edit, the whole of the book.

J. A. F. WILKINSON

DIE SELTENEN ERDEN VOM STANDPUNKTE DES ATOMBAUES. By Dr. G. VON HEVESY. *Struktur der Materie in Einzeldarstellungen*, edited by M. BORN and J. FRANCK. Pp. viii + 140. Berlin: Julius Springer, 1927. Price, paper, 9 m.; bound, 10.20 m.

The name of the author should in itself be a sufficient guarantee that this book is worth reading; if any further were needed, it would be that the book forms volume V of Professors Born and Franck's series entitled "Struktur der Materie." The first part deals with the position of the elements in question in the periodic system, reviews their general behaviour from the point of view of atomic structure, and discusses the regularities apparent in the group. In the second part, the chemical characteristics are more closely investigated and the analytical characters, separation, and occurrence are summarised. Original investigations, chiefly those published during the last ten years, are freely quoted, and an account is given of the history of the discovery of the rare earths, including that in 1926 of element No. 61.

A. A. F.

LE MANUEL DU PARFUMEUR. By H. ASKINSON. 4th French edition, revised and corrected by R. Sornet. Pp. 111. Paris: Gauthier-Villars et Cie. 1927. Price 18 fr.

It is extremely difficult to know to what particular class of reader this brochure is intended to appeal. It is quite elementary, and contains little, if anything, that is not to be found in other works, and it is so incomplete in its treatment of many subjects as to be of but little practical use. For example, after an incorrect differentiation between artificial and synthetic perfumes (natural isolates being classed as artificial perfumes), the author proceeds to describe a few synthetic perfumes without a single reference to the modern discoveries which have revolutionised the perfume industry. Hydroxycitronellal, the acetylenic carbonates, the higher fatty aldehydes, and many other substances which are in every up-to-date perfumer's laboratory, are not even mentioned. For a sin of commission we will only quote the following statement from page 17:—"With the exception of perfume materials made in Turkey and the Indies, particularly the essences of Rose, almost all of them are brought upon the market from the south of France and the neighbouring country, Italy. Some, however, come from England, such as oils of lavender and peppermint." So utterly incorrect is this statement that it needs no comment.

We do not think this little book will appeal to English readers.

ERNEST J. PARRY

COMPANY NEWS

B. LAPORTE, LTD.

After transferring £203 to reserve account and allowing for depreciation etc., the profit for the year ended June 30, 1927, was £11,459, plus £9815 brought in. A dividend has been recommended on the ordinary shares of 6%, less tax (compared with 9% for the previous year), carrying forward £6095. The first half of the year under review was adversely affected by the coal strike, the extra cost of fuel and motive power alone amounting to over £10,000.

BURT, BOULTON, AND HAYWOOD, LTD.

A dividend has been declared of 5% on the ordinary shares, compared with 10% for the previous year.

BRITISH ALUMINIUM CO., LTD.

An interim dividend has been declared of 4% (actual), less tax, on the ordinary shares, being the same as for each of the two preceding years.

BRITISH OIL AND CAKE MILLS, LTD.

An interim dividend has been declared on the cumulative preferred ordinary shares of 5%, less tax.

UNITED INDIGO AND CHEMICAL CO., LTD.

The net profits for the year to June 30, 1927, amounted to £21,892, compared with £21,707 for 1926. The dividend has been increased on the participating preference and the ordinary shares from 7½% to 8½%, subject to tax, carrying forward £15,282, against £14,170 brought in.

INTERNATIONAL HOLDINGS AND INVESTMENT CO., LTD.

At the annual ordinary general meeting, held on September 9, and presided over by the chairman, Mr. A. Loewenstein, C.B., the resolution was passed for the sale of the company's assets to the International Holding and Investment Co., Ltd. (incorporated in the Province of Quebec, Canada). Details of the transaction were given in *CHEMISTRY AND INDUSTRY* on September 9, 1927, page 816.

ONVERWACHT PLATINUM, LTD.

During the year ended June 30, 23,673 tons were milled, from which 8,963,755 fine ounces of platinum and allied metals in the form of crude platinum were produced, equivalent to a yield of 7.572 dwt. per ton milled. The net profit was £90,782, of which £78,750 was absorbed by the two dividends, totalling 17½% already paid, and £6813 by taxes, leaving £5219 to be carried forward. During the year 8322.9 fine ounces were sold, realising £142,858 net, or £17 3s. 3d. per fine ounce.

BULMER RAYON CO., LTD.

The accounts for the period from November 21, 1925 (date of incorporation of company), to January 31, 1927 show a loss of £32,390, which the directors attribute to the coal strike, to general market conditions, and to certain unavoidable delays in the development programme. One unit of the plant commenced operations last February; the second unit will be in operation by the end of September, and the third unit will probably start production by January or February next. The company is finding a ready outlet for its product, which is claimed to be of equal quality to any on the market. Sales are steadily increasing, and the production is fully sold for some months ahead. No dividend has been paid on the 8% cumulative preference capital since its issue in November, 1925.

BRITISH PLATINUM AND GOLD CORPORATION

It is announced that, as a result of suggestions made by the advisory committee set up in connexion with the recent issue of debentures, changes have been made in the Board, which now consists of the Hon. Lionel Guest (chairman), Mr. C. Chantrey Inchbald, Major F. W. D. Gwynne, O.B.E., Mr. T. J. Ive, Mr. G. H. Short, and Senor J. A. Mayolo.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
Bisulphite of Lime.—£7 10s. per ton, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton, home market, 1-cwt. iron drums included. Sod. Chlorate, 2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.r. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.r. London, 1-cwt. kegs included.

RUBBER CHEMICALS
Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
Arsenic Sulphide, Yellow.—1s. 9d. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 1d. per lb.
Diphenylguanidine.—3s. 9d. per lb.
Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.

Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P. £47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide. 2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Good demand. Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbohc. Crystals.—8d.—8½d. per lb. Crude 60's, 2s. 6d.—2s. 7d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 4d.—2s. 5d. per gal. Pale, 95%, 2s. 2d.—2s. 3d. per gal. Dark, 90%, 1s. 9d.—1s. 10d.; 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons, Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 4d.—1s. 5d. per gal. Pure, 1s. 6d.—1s. 7d. per gal.
 Xylol.—1s. 3d.—1s. 4d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d. per gal. Heavy, 9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 8½d.—9½d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, 8½d.—9½d. per gal.
 Naphthalene Crude. Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals.—£11 10s.—£12 per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—88s. 9d.—91s. 3d. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb. 100% basis d/d.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Wintner.—4s. 9d. per lb.
 Acid Sulphanilic.—9d. per lb. 100% basis d/d.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 20/31° C.—5½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C. 9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol. 11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb. d/d.
 β-Naphthylamine.—3s. per lb. d/d.
 p-Nitraniline. 1s. 8d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline. 5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb. d/d.
 R. Salt.—2s. 2d. per lb. 100% basis d/d.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb., naked at works.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xyldine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
 Acid, Benzoic B.P. 2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P. Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 3½d. per lb. Technical 11½d.—1s. per lb. Good demand.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P. Lump £37 per ton, Powder £30 per ton, in 5 cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—11s. per oz. for English make.
 Barbitone. 6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—10s. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 2d.—2s. 3d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot.

Calcium Lactate.—1s. 2½d.—1s. 3½d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 6d. per lb., duty paid.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively;
 730.—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.
 —1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P.B. 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—5s. per lb.
 Hexamine.—2s. 4d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols. 2s. 3d. per gal. In carboys: Winchesters, 2s. 11d.—3s. 9d. per gal.; 20 vols., 4s. 3d. per gal.; Winchesters, 5s.—6s. 6d. per gal. Special prices for larger quantities.
 Hydroquinone.—2s. 11d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate. B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—4d. per lb., 22s. per cwt.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 10s. 12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 5d.—7s. 7d. per lb., Levig. 6s. 11d.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 8d.—5s. 10d. per lb., Powder, 5s. 1d.—5s. 3d. per lb.; White precip., Lump, 6s. 10d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 3d.—6s. 5d. per lb.; Yellow Oxide, 6s. 9d.—6s. 11d. per lb.; Persulph B.P.C., 6s.—6s. 2d. per lb.; Sulph. nig., 5s. 9d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—9s. 6d.—9s. 9d. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 9d.—3s. per lb.
 Phenazone.—4s. 3d.—4s. 9d. per lb.
 Phenolphthalein.—6s.—6s. 3d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—2s. per oz.; 1s. 8d.—1s. 9d. per oz. in 100 oz. tins (1000 oz. lots).
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 8d.—1s. 9½d. per lb. Crystal, 1s. 9d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s. per ton, 5 ton lots.

Sulphonal.—£28 per ton, 2 ton lots.

Tartar Emetic B.P. cryst. or powder.—£28 10s. per ton, 1 ton lots.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (ex Anethole).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.

Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.

Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 17s. per lb.

Coumarin.—10s. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb.—(ex Shui Oil) 10s. 6d. per lb.

Linalyl Acetate.—(ex Bois de Rose) 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—17s. 9d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—3s. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.

Camphor.—75s. per cwt. Cananga, Java, 26s. per lb.

Cassia, 80/85%.—7s. 6d. per lb. Cinnamon. Leaf.—6d. per oz. Citronella.—Java, 1s. 10d. per lb., Ceylon, Pure, 1s. 9d. per lb. Clove, pure—5s. 6d. per lb.

Eucalyptus.—2s. 3d. per lb. Lavender.—Mont Blanc 38/40%. 19s. 3d. per lb. Lemon.—8s. per lb. Lemon-grass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb.

Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 6d. per lb. Peppermint.—Wayne County, 16s. 9d. per lb. Japanese, 8s. 3d. per lb.

Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Nov 8th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Sept 22nd. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Boving. Absorption refrigerators. 22,855. Aug. 31.
 Denham and Simon. Grinding etc. machines. 23,193.
 Sept. 3.

- I.-G. Farbenind., Manufacture of acid-proof materials. 22,750. Aug. 30. (Ger., 30,826.)
 Larson. Machine for making emulsions. 22,852. Aug. 31.
 Tinson. Furnaces. 22,735. Aug. 30

I.—Complete Specifications

- 12,639 (1926). Dessauer. Analysing substances by means of Röntgen or cathode rays. (252,206.)
 31,165 (1926). Trautmann. Apparatus for heating substances in a finely divided state. (262,791.)
 1227 (1927). Synthetic Ammonia and Nitrates, Ltd., and Humphrey. Centrifugal apparatus. (276,557.)
 10,822 (1927). Lister & Co., and Lister. Grinding mills. (276,591.)
 14,645 (1927). Siemens Elektrowärme-Ges. Bucht annealing furnaces. (272,214.)
 120,608 (1927). Lanthoffer, and Lanthoffer. Conveying powdered or granular material. (276,648.)
 *21,114 (1927). Wiggins. Storage tanks for gases and volatile liquids. (276,653.)

II.—Applications

- Broadhead, and Broadhead Constructions, Ltd. Gas purifiers etc. 22,749. Aug. 30.
 Colas Products, Ltd. (Hammond), Terry, and Whiting. 23,074. See IX.
 Imperial Oil, Ltd. Treating hydrocarbon oil. 22,745. Aug. 30.
 Johnson (I.-G. Farbenind.). Production of hydrocarbons of low b.p. 22,681 and 23,191. Aug. 29 and Sept. 3. Production of gases rich in olefins. 23,017. Sept. 1. Recovery of soluble products from coal etc. 23,018. Sept. 1.
 Knowles. Drying gases. 23,183. Sept. 3.
 Siemens & Halske A. G. Determining constituents in mixture of gases. 23,189. Sept. 3. (Ger., 49,26.)
 Soc. O. Monnet et Cie. Manufacture of agglomerates of wood charcoal. 22,905. Aug. 31. (Fr., 2,427.)
 Still and Still. Purification of benzol fractions. 22,869. Aug. 31. (Ger., 13,127.)
 Studienges. für Gasind. Apparatus for preparing compressed gases. 21,384. Sept. 3. (Ger., 18,1026.)
 Wolmski. Treatment of coal. 22,983. Sept. 1. (Ger., 1,926.)

II.—Complete Specifications

- 1417 (1926). Frankl. See VII.
 9523 (1926). Shadbolt, and Chem. Engineering & Wilton's Patent Furnace Co., Ltd. Recovery of pyridine, phenols, oils, etc., from gas liquor and like ammoniacal liquors. (276,393.)
 11,421 (1926). Soc. Anon. D'Explosifs et de Prod. Chim. Treatment of gases produced in cracking hydrocarbons. (251,632.)
 13,343 (1926). Florentin, Kling, and Matignon. Obtaining light hydrocarbons from hydroxylated, carboxylated, and like oxygenated organic compounds. (263,082.)
 13,348 (1926). Carpmael (I.-G. Farbenind.). Purification of hydrocarbons obtained by cracking processes. (276,427.)
 25,480 (1926). Synthetic Ammonia & Nitrates, Ltd., Slade, and Harrison. Low-temperature distillation of carbonaceous material. (276,522.)
 28,055 (1926). Misco. Generating carburetted water gas from bituminous fuel. (276,530.)
 28,559 (1926). La Ribonniere. Cracking of mineral oil and other hydrocarbon material. (276,532.)
 *21,349 (1927). Akt. Separator Nobel. Separating paraffineous constituents etc. from oils. (276,658.)
 *22,488 (1927). Gewerkschaft der Steinkohlenzeche Mont-Cenis. See VII.

III.—Application

- Verkaufsv. für Teererzeugnisse Ges. 22,649. See IX.

III.—Complete Specification

- 9523 (1926). Shadbolt, and Chem. Engineering & Wilton's Patent Furnace Co., Ltd. See II.

IV.—Applications

- Gubelmann, Stallmann, and Weiland. Making 1:3-diamino-2-hydroxyanthraquinone. 22,688. Aug. 29.
 Imperial Chemical Industries, Ltd., Gibson, Hailwood, Payman, and Shepherdson. Naphthalene derivatives. 22,663. Aug. 29.
 Inray (I.-G. Farbenind.). Manufacture of azo dyestuffs. 22,657. Aug. 29.
 Johnson (I.-G. Farbenind.). Manufacture of black tetra-trisazo dyestuff. 22,686. Aug. 29. Manufacture of black trisazo dyestuff. 23,016. Sept. 1. Dyestuffs. 23,192. Sept. 3.

IV.—Complete Specifications

- 12,381 (1926). Carpmael (I.-G. Farbenind.). Manufacture of products of the anthraquinone series. (276,408.)
 19,205 (1926). I.-G. Farbenind. Manufacture of azo dyestuffs. (256,272.)
 22,381 (1926). Silesia Ver. Chem. Fabr. See XX.
 5245 (1926). Inray (Soc. Chem. Ind., in Basle). Manufacture of aromatic tetrahydronaphthylamines or derivatives thereof. (276,571.)
 8146 (1927). I.-G. Farbenind. Manufacture of substituted aromatic sulphonic acids. (269,155.)

V.—Applications

- Arnold Print Works. 23,147. See VI.
 Brandwood. Treatment of fabrics with fluids. 23,154. Sept. 3.
 Feldmühle A. G. vorm. Loeb, Schonenfeld, & Co. Manufacture of viscose. 23,130. Sept. 2. (Ger., 1,827.)
 I.-G. Farbenind. Manufacture of sulphonated cellulose derivatives. 22,656. Aug. 29. (Ger., 10,926.) Production of strips from cellulose derivatives. 23,098. Sept. 2. (Ger., 13,427.)
 Imperial Chemical Industries, Ltd., and Wilson. Treatment of cellulose derivatives. 23,198. Sept. 3.
 Inray (I.-G. Farbenind.). Obtaining cellulose from ligno-cellulosic material. 22,749. Aug. 30.

V.—Complete Specifications

- 14,185 (1926). British Dyestuffs Corp., Ltd., Baddiley, Chorley, and Butler. See VI.
 *22,362 (1927). I.-G. Farbenind. Manufacture of viscose silk. (276,679.)

VI.—Applications

- Arnold Print Works. Treatment of cellulosic fabrics. 23,147. Sept. 3. (U.S., 9,1226.)
 Ratignier. Printing fabrics in several colours. 22,790. Aug. 30.
 Velour u. Filzhatfabr. Smdermann & Co. Dyeing shapes of hats. 22,761. Aug. 30. (Austria, 22,327.)

VI.—Complete Specification

- 14,185 (1926). British Dyestuffs Corp., Ltd., Baddiley, Chorley, and Butler. Dyeing artificial silk. (276,450.)

VII.—Applications

- I.-G. Farbenind. 22,750. See I.
 Johnson (I.-G. Farbenind.). Conversion of alkali chlorides into nitrates. 22,685. Aug. 29.
 Studienges. für Gasind. 21,384. See II.

VII.—Complete Specifications

- 1417 (1926). Frankl. Separation of gaseous mixtures. (276,381.)
 7709 (1926). Meyerhofer. Production of complex hydrofluoric acids. (250,211.)
 9227 (1927). Jacobsson. Dissolving aluminiferous raw materials by means of sulphuric acid or acid sulphates. (269,174.)

*18,838 (1927). Siemens & Halske A.-G. Generation of ozone. (276,637.)

*21,439 (1927). Petersen. Manufacture of sulphuric acid. (276,659.)

*22,180 (1927). Gewerkschaft der Steinkohlenzeche Mont-Cenis. Purifying hydrogen. (276,668.)

*22,488 (1927). Gewerkschaft der Steinkohlenzeche Mont-Cenis. Purifying hydrogen and gases containing hydrogen. (276,687.)

*22,750 (1927). I.-G. Farbenind. Manufacture of acid-proof material. (276,697.)

VIII.—Applications

Abson, Brodie, and Mackenzie. Decoration of pottery etc. 23,042. Sept. 2.

Carborundum Co., Ltd. (Power). Abrasive compositions. 22,795. Aug. 30.

Carpmael (I.-G. Farbenind.). Manufacture of ceramic products. 22,705. Aug. 29.

VIII. Complete Specification

12,848 (1926). Crabb. Cleaning of clay. (252,379.)

IX. Applications

Borgestad Fabr., and Knudsen. Refractory building materials. 23,176. Sept. 3.

Colas Products, Ltd. (Hammond), Terry, and Whiting. Bituminous emulsions etc. 23,074. Sept. 2.

Koninklijke Stearine Kaarsenfabr. Gouda. Manufacture of asphalt concrete. 22,668. Aug. 29. (Holland, 2,8,27.)
Verkauf-ver. für Teerzeugnisse Ges. Bituminous road material. 22,649. Aug. 29. (Ger., 7,10,26.)

IX. Complete Specification

13,581 (1926). British Portland Cement Manuf., Ltd., Baxter, Bamber, and Dickinson. Manufacture of cement. (276,438.)

X.—Applications

Akt. Ferriconcentrat. Enriching iron ores etc. 23,203 Sept. 3. (Sweden, 28,10,26.)

Beatty (Bell Telephone Laboratories, Inc.). Magnetic alloys. 22,700. Aug. 29.

Coles. Sherardising. 23,057. Sept. 2.

Harris. Separating impurities from lead etc. 23,174. Sept. 3.

Krupp Grusonwerk A.-G. Extraction of precious metals from ores etc. 22,788. Aug. 30. (Ger., 6,9,26.)

X.—Complete Specifications

*25,863 (1926). Siemens & Halske A.-G. See XI.

*31,534 (1926). Krupp A.-G. Low-carbon steel. (276,615.)

*20,317 (1927). Zahner & Schuess & Co. Lead coating of articles. (276,643.)

*22,340 (1927). Siemens-Schuckertwerke A.-G. Bright-annealing furnaces. (276,674.)

*22,343 (1927). British Thomson-Houston Co., Ltd. Carburisation of metals. (276,675.)

*22,750 (1927). I.-G. Farbenind. See VII.

XI.—Applications

André. Conductors of high negative temperature coefficient. 22,786. Aug. 30. (Fr., 17,11,26.)

Bannister and Cooper. Electroplating etc. 22,839. Aug. 31.

Birmingham Electric Furnaces, Ltd. Electric furnaces etc. 23,162. Sept. 3.

Dicker (N. V. Philips' Gloeilampenfabr.). Electric discharge tubes etc. 22,697—8. Aug. 29. Electric incandescence lamps. 22,699. Aug. 29.

General Electric Co., Ltd. Electric incandescence lamps etc. 22,629. Aug. 29. (Ger., 6,9,26.)

Metcalfe and Read. Photo-electric cells. 23,021—2. Sept. 1.

Neale, J. Selenium cells. 22,652. Aug. 29.

XI.—Complete Specifications

*25,863 (1926). Siemens & Halske A.-G. Apparatus for galvanic processes, e.g., chrome-plating. (276,610.)

*18,838 (1927). Siemens & Halske A.-G. See VII.

XIII.—Applications

British Thomson-Houston Co., Ltd., Newbound, and Warren. Lacquers etc. 22,862. Aug. 31.

Carbide & Carbon Chemicals Corp. Lacquer compositions. 22,996. Sept. 1. (U.S., 10,2,27.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *British India*: Medicines (193); Patent medicines (194). *Colombia*: Chemical and pharmaceutical products (208). *Egypt*: Two semi-Diesel engines (A.X. 5166). *New Zealand*: Transformer-oil drying and testing apparatus (A.X. 5175). *South Africa*: Motor-driven centrifugal pump (A.X. 5157); suction gas engine and electric generator (B.X. 3772).

Merchandise Marks Act, 1926

In accordance with the provisions of Section 2, Sub-section (1), of the Merchandise Marks Act, 1926, the Board of Trade give notice that in pursuance of applications received by them for the making of Orders in Council to require imported goods of certain classes and descriptions to bear an indication of origin, they have made a reference to the Standing Committee appointed by them under the Act in respect of (*inter alia*) the following classes and descriptions of imported goods.

(1) (a) Electric cables, insulated, of all descriptions; (b) electric wires, insulated, of all descriptions. (2) Rubber manufactures of the following descriptions: rubber in sheets; piping and tubing of rubber or rubber and other materials, armoured or not; rubber balls of all descriptions (including golf balls and tennis balls); toys, wholly or mainly of rubber; elastic cords, webs, braids and fabrics; mats, matting and tiling of rubber; rubber gloves; rubber proof cloth and articles made therefrom, as well as any other manufactures consisting wholly or mainly of rubber, and including ebonite, vulcanite and manufactures thereof (but not including motor covers and tubes, solid and semi-solid tyres, boots,

shoes and slippers, or screw bottle stoppers). (3) Electric incandescent lamps.

Attention is called to the fact that under the provisions of the above-mentioned Act, while the Committee in every case referred to them must consider whether the goods should bear the indication of origin at the time of sale or exposure for sale, they may also at their discretion consider and report upon the question whether such goods should bear an indication of origin at the time of importation. Representatives of any interests substantially affected by any of these applications who desire to be heard in opposition at the public enquiry, which will be held later by the Committee, are requested to communicate with the Secretary, Mr. E. W. Reardon, New Public Offices, Great George Street, London, S.W.1, as early as possible, and not later than the end of September.

Import and Export Restrictions

The Board of Trade announces that an International Conference has been summoned to meet at Geneva on October 17 to frame an international agreement for the abolition of import and export prohibitions and restrictions. H.M. Government will be represented by Sir Sydney Chapman, K.C.B., C.B.E., Economic Adviser to the Government, assisted by Mr. H. V. Reade, C.B., an assistant secretary to the Commissioners of Customs and Excise, as deputy delegate and customs adviser, and by Mr. Gilbert C. Vyle, President of the Association of British Chambers of Commerce, and Colonel the Hon. F. Vernon Willey, C.M.G., ex-President of the Federation of British Industries, as deputy delegates and commercial advisers.

Precious Metals

Two brochures, which are of an elegance well in keeping with their subject, have been published by Johnson, Matthey & Co., Ltd., of Hatton Garden, London. One brochure describes the service which the firm can render to laboratory workers, in supplying not only apparatus in platinum and kindred metals, but also platinum salts, platinised materials, osmic acid, iridium sesquioxide, silver nitrate, etc., which are required in the laboratory. The second brochure describes the forms of the precious and rarer base metals which the firm supplies for industrial use, such as platinised asbestos and pumice, various platinocyanides, salts of gold and silver, uranium oxide, selenium dioxide, sodium selenite in addition to platinum, gold, silver, palladium, iridium, osmium and ruthenium, and other precious as well as various base metals. There are many other products described in these brochures, which should be consulted for further information.

No. 38

EDITORIAL

Fuel Technology as a New Profession

THE Commercial is a weekly review published by the *Manchester Guardian*. Its issue of the 8th inst. contains an article by Prof. J. W. Cobb, with the title we have chosen for this note. We read the article with much pleasure, and for more than one reason—those who are real readers, not collectors of facts, find that one great delight in reading is to be taken back to a period in early life, when they were romantic, sensitive, innocent and unalloyed by industrial or technical pursuits. We can find again, as we read Rob Roy or Esmond, some of that first careless rapture which we can now recover in no other way. No very recent book, however pathetic, really moves us, and yet there are passages in Virgil and Homer which we can even now hardly read without the thrill of a feat, just as it was when we read them twenty or thirty years ago. This was one pleasure in reading Prof. Cobb's article, for we were fellow students together on many subjects, scientific and otherwise, and worked, and idled, together in a time and a place both of which are invested with a kind of purpled gleam—so far as his place is concerned, it is harder for him to picture them than it is for us; he lives in Leeds to this day, and has watched it grow, and it has not grown in beauty. Another reason why we enjoyed reading his account of fuel technology as a profession is that Prof. Cobb has delivered a round, unvarnished tale, and made use of words such as most fully and precisely convey his meaning to the great body of his readers; this is not an invariable practice of all writers. He tells us that at Leeds the B.Sc. in gas engineering follows a three-years' course; the first year is devoted to physics, chemistry, mathematics, engineering, and an introduction to fuel; the second year is spent in chemistry and engineering, including carbonisation, refractory materials, pyrometry, and so on; the third year is spent in carbonisation, gas producers, engineering economics, analysis, distillation, and similar studies; during two out of the three months of each long vacation the student gets work experience. As two hundred million tons of coal are consumed in this country every year and about five million tons of liquid

fuel, the industry of preparing and selling fuel is a large one; moreover, as not less than 10% of the coal is wasted by inefficient combustion, there is plenty of work for the fuel technologist to do. He has not only plenty to do, but his work is very varied: the burning of coal in domestic grates, its use for steam raising, whether in lump form or as powdered fuel, its distillation to make gas, low-temperature carbonisation, and hydrogenation are among the many things which require study. Not only must the fuel expert understand ordinary bituminous coal, he must also know about cannel and the distillation of oil from it, and about bituminous ironstones, and oil shales and lignites and peat, from which they say activated carbon may be prepared, and oil and how to crack it, and the coke which is made in the process. And then there is water-gas and all its uses in mixing with other gases; the fuel technologist is supposed also to know about tar and phenols and cresols and pyridene and naphthalenes, and the use of naphthalene and paranitrophenol as insecticides in agriculture. He must talk intelligently about petrol and knocking and pinking, and those who explore the constitution of coal have an endless task in front of them. One notable feature of this profession is that the demand exceeds the supply. As in chemistry, the man who wishes to indulge in research has only to take the first material that comes to his hand and he will find abundant problems. The discussion on coal by the Engineering Section of the British Association printed in this issue is another proof of the enormous range of fuel technology.

The Rothamsted Report, 1925-26

We suppose the Rothamsted Experimental Station at Harpenden is known to chemists and to students of agriculture all over the world. The report of the work carried out there, and of its publications for 1925-26, is, as usual, full of interesting matter. It gives a singular picture of the complexity of the soil, whether we are considering the animal, vegetable, or mineral components of this domain. Chemists are concerned in all three components, and we think that prolonged

study would be necessary to follow all that goes on. The soil may be conveniently divided into the dead portion and the live portion; the dead portion consists of the sand, clay, lime, water, acids, alkalis, salts, lignin and its derivative humus, cellulose and its many derivatives, which are finally carbonic acid and water. From the chemical point of view the various elements in the soil include some of the plant stuffs from which the plant is made, the nitrogen, phosphorus, potassium, calcium, sulphur, and so forth; another class includes elements which appear to be useful rather than necessary—sodium, which helps when the supply of potassium is inadequate, and silicon, which helps the plant to assimilate its due proportion of phosphorus. The silicon is usually present in the form of silicates, and soluble silicates in particular tend in many cases to cause an increase in the dry weight of the plant. The value of lime and limestone has so often been pointed out in this JOURNAL that on this occasion it seems hardly necessary to say more than this: lime and limestone should be used to neutralise the acidity of the soil, if any; they also improve the texture of a clayey soil. Then there is the class of elements present in such minute quantities that they may almost be classed as catalysts, iron without which the chlorophyll does not form, manganese without which oxidation is inadequate, chlorine and so on. Boron in any form of combination is essential to the activities of the organisms which make the nitrogenous nodules on leguminous plants. The live part of the soil seems to be very varied: it hardly seems necessary to divide it into animal and vegetable. These low forms of life are all so small and so simple—there is a constant struggle for existence between the bacteria, the protozoa, the algae and the fungi, and part of the skill of the farmer consists in maintaining a proper balance between these. The number of the bacteria is considerable and their habits are diverse; some decompose the cellulose of dead plants, others spend their time in making nitrates and nodules. Each leguminous plant seems to require its own special breed of bacterium; you cannot grow lucerne in soil which lacks the lucerne organism. The soil protozoa, of which at least 250 different kinds are known, devour the bacteria and in some instances preserve in their bodies the nitrogen collected by the bacteria. When the protozoa have waxed fat and preyed too much on the bacteria, you should steam them or kill them with phenols, nitrobenzene, and cresols. The habits of the algae are not clearly explained in those portions of the Report which we have read, but the fungi play important parts. The bulk of the decomposition of cellulose is due to them; the decomposition of lignins seems to be wrapped in some mystery, and is perhaps not to be attributed to fungi, but the fungi are terrible causes of plant ailments. The research workers at Rothamsted have great opportunities of research. The junior ones spray plants and trees with insecticides, and note the results. When they are proficient in this they breed parasites to kill earwigs and do similar work of an advanced character. The Report contains much information about aphides, the weather, wheat, barley, mangolds, statistical estimation and random sequences. It has a valuable list of publications, many abstracts and

statistics, and we imagine it is necessary to every scientific student of agriculture.

The Royal Society of Arts

This society has had a long and distinguished career, and has rendered important services to art, science, literature and industry. Its scientific lectures have attracted great attention, and many of these have appeared in the pages of this JOURNAL. Its Council includes several members of the Society of Chemical Industry, and we can recall many occasions when a popular account of a chemical investigation has been delivered before the Society of Arts by a recognised authority in a manner worthy of the subject and of the lecturer. We were interested to come across another branch of the Society's activity which is certainly interesting from the point of view of art, and may be of importance in certain industries which depend both on chemistry and on art; there are many of these: the textile industries and the pottery and glass industries are notable examples. Four years ago the Society of Arts promoted a competition of industrial designs, and offered prizes to the competitors whose designs were chosen by an expert committee; the competition was a success, and was repeated in subsequent years. This year the fourth competition was held, and prizes of the total value of £1200 were distributed. The judges were well known men in their respective industries, and we understand that many of the designs submitted were so excellent that the design, and in some cases the designer also, were rapidly absorbed into the industry. This year the competition was divided into architectural decoration, textiles, furniture, book production, pottery and glass, and a miscellaneous section, which was chiefly artistic advertising. Among those who gave prizes were many whose names are well known in chemical circles, Messrs. Lewis Berger & Sons, Messrs. Longmans, Green & Co., the Cambridge University Press, the Goldsmiths' Company, Messrs. Bryant & May, and Messrs. Henley's Tyre and Rubber Co., Ltd., being included. There are very many instances which occur to us in which art and science may conveniently go hand-in-hand; in some cases this is already done, but suitable artistic design is neither easy to learn nor easy to appreciate, and it seems to us to be a good thing that this sort of stimulus should be provided. A design may be excellent in appearance, but unsuitable for production, and these competitions had the advantage of being judged not only by those who have a well-developed artistic temperament, but also in conjunction with them, by men whose life is spent in manufacture, sale and distribution. Personally we are sorry that we did not know of this competition earlier; we should have enjoyed seeing the designs, and might possibly have learned a little about a subject of which we are wholly ignorant. We hope that next year the Society of Arts will let us, and our readers, know in ample time when and where the designs may be seen so that those of us who are interested may look out for an opportunity. Perhaps notices appeared in all the daily papers; these are not read by chemists with the same care and attention which they bestow on the JOURNAL OF THE SOCIETY OF CHEMICAL INDUSTRY.

OUR AVAILABLE COAL SUPPLIES AND THEIR UTILISATION*

By Dr. C. H. LANDER, M.Inst.C.E., M.I.Mech.E.

In the past Great Britain, a pioneer in coal production, has been in a very favourable position, owing to the early working, wide variety, and high quality of the enormous stores of coal in her possession. The world's chief source of fuel is, and must long continue to be, found in the vast and widely distributed accumulations of coal; but other fuels which have been exploited during recent years are tending gradually to place Great Britain in a less favourable position, and to put her at a disadvantage with competing nations. This state of affairs is emphasised by the fact that certain of her commercial rivals have themselves large stores of coal, which are now being worked to a much greater extent than during the last century.

The output of coal in Great Britain may be taken, roughly, at 260,000,000 tons per annum, of which some 80,000,000 tons is exported. The remaining 180,000,000 tons is retained for home use. It is not possible to say with accuracy how this coal is distributed, but the annexed table, from the Fifth Annual Report of the Secretary for Mines, gives an approximate indication of the purposes to which it was put in the years 1921 and 1925.

The various headings can be considered in two groups, according to whether the coal is subjected to some pre-treatment before being finally burnt, or is burnt in its raw state. The two chief industries in the former group are the coking industry, whose main product is metallurgical coke for iron and steel manufacture, and the gas industry, whose main product is gas for town's purposes. The two together consume 35,000,000 tons to 40,000,000 tons, leaving in the latter group 140,000,000 tons, which are used in the raw state.

The requirements of industry in the direction of fuel are so varied as to render it impossible to lay down any single ideal method of utilisation; but, having regard to the large quantity of coal burned in the raw state, it is legitimate to consider whether improvements in utilisation could not be effected by wider adoption of methods of pre-treatment. It is a mistake to assume that it is fundamentally uneconomical to use coal in the raw state, since the products obtained by pre-treatment are, in the main, themselves ultimately burnt. If, however, it can be shown possible to split up the coal into such products as can be utilised with greater commercial efficiency than can the raw material, savings may be effected, but these savings must be sufficiently great to compensate for the inevitable loss of heat units involved in any process of pre-treatment.

Until the 'nineties of last century all our heat and power requirements were obtained directly from coal, but the growth of the internal-combustion engine, in conjunction with the exploitation of the world's great oilfields, has resulted in a rapid expansion of a method of power production, and to a smaller extent of heat production, which is not easily satisfied by using coal raw. According to our present practice, liquid fuels are required in large quantities for both land, sea and air

transport, but are procurable only from overseas sources. Thus our national defence is entirely dependent upon a fuel which has to be imported. It has been known for the last one hundred years that when coal is subjected to some pre-treatment, such as raising it to a high temperature in the absence of air, the coal substance is split up into three other fuels, solid, liquid and gaseous respectively—or, in other words, into coke, tar or oil, and gas. When coal is burned in the raw state, those portions which would, had it been carbonised, have gone to produce the liquid and gaseous constituents, are only completely utilised if special precautions are taken. Very different conditions are required within a furnace to burn coke, oil and gas, and we therefore find that a certain proportion of their volatile products is usually allowed to escape into the atmosphere in the form of smoke. The author hesitates to put forward the following figures, since the whole subject is so complicated that they only present a portion of the picture, but if the remaining coal in Great Britain can be taken as 180,000 million tons, and if it is assumed that 10 gals. of oil per ton could be extracted from this coal, we have actually in the country 1,800,000 million gals. of oil, a supply far exceeding the estimated petroleum reserves of the whole of the United States. Looked at from the fundamental point of view, it is surely somewhat Gilbertian to import nearly 2,000 million gals. of oil per year when such vast supplies lie dormant in the country. Since, however, oil obtained from coal must at present be regarded as a by-product, it does not follow that the production, even from the whole of the coal raised in the country, would make it possible to do altogether without imported oil; but it is obvious that the present situation could be considerably eased by the institution of methods whereby pre-treatment of coal could be carried out economically in a much widened field.

The desirability of improving the present position is further emphasised in view of the vast amount of damage to property, and possibly also to health, which is caused by smoke. It has been estimated that in Manchester the damage by smoke exceeds three quarters of a million pounds per annum. For London, Russell a few years ago gave a figure of £1 per head per annum. In Pittsburgh, a careful investigation in 1913 led to an estimated loss of £1 per head. Again, the Samuel Commission pointed out that the work of over a million miners for three days every year was devoted to providing the soot which pollutes our atmosphere.

From the table it is impossible to gather what proportion of coal is utilised in industry for power production as differentiated from the production of heat, and there are no data yet available from which this item of fundamental knowledge can be deduced. When a fuel is required for power purposes it can only be used with a thermal efficiency which is comparatively low (say an average of 20% in the steam turbine), the remainder of the heat being dissipated in the condensing water etc. On the other hand, when fuel is required for heating purposes, its efficiency of utilisation may be very much higher, perhaps three times as much as the example cited above. It will, therefore, be seen that, if it were possible to make an accurate estimate for the country, or even for some particular district, of

* Paper read before Section G of the British Association at Leeds on September 2, 1927.

the proportions in which fuel is used for these two purposes, a much better conception might be formed of the degree to which it might be subjected either to carbonisation processes or to the production of electricity.

There are, of course, many instances in which useful supplies of electricity might be generated as a by-product, if large quantities of heat were also required as such, say for carrying out chemical processes.

From what has been indicated it is obvious that our fuel utilisation is to say the least of it, imperfect, and it must be emphasised that there are means available whereby great improvements could be made. Far more knowledge exists for the improvement of both thermal and commercial efficiency than was available during the last century, and this knowledge should be applied to a very much greater degree than is the case at present. As the late Sir George Bellby stated: "The out-standing feature of the situation appears to be that, while on the one hand there already exist among

ship. The bulk of the work undertaken at East Greenwich is, therefore, of the large-scale type, such as the development of improvements in methods of carbonising in gasworks plant; experiments on boiler firing, using full-sized boilers; investigations into different systems of coal cleaning, using for the purpose full-scale units of typical coal cleaning plant; and so on.

There are, of course, well equipped laboratories, which are used for purposes of works control, and also for such fundamental enquiries as are essential to ensure the most fruitful results being obtained from the full-scale plant. In spite of this, however, the bulk of fundamental work, as such, must be left to outside workers. The present deficiencies are continually being felt in the full scale investigations, and the speaker will instance one or two interesting cases where difficulties have arisen through lack of basic information.

Some time ago a carbonisation process was suggested, in which the coal was ground, heated up to a temperature at which it became plastic, and finally briquetted at

TABLE OF APPROXIMATE COAL CONSUMPTION IN GREAT BRITAIN

Consumption	1913-14 (tons)	1924-25 (tons)	1926-27 (tons)
Coal (except metallurgical coke)			
Total quantity	16,291,000	18,861,000	
Less: equivalent of coke (included)	1,250,000	1,300,000	
Net home consumption		17,611,000	17,561,000
Gas works			
Total quantity	17,709,000	18,761,000	
Less: equivalent of coke (included)	1,310,000	1,300,000	
Net home consumption		17,451,000	17,261,000
Manufactured fuel			
Total quantity	1,071,000	1,088,000	
Less: equivalent of home extracted fuel (expected, or shipped on account of domestic coal in foreign trade)	1,071,000	1,088,000	
Net home consumption		12,000	12,000
Electricity generating stations (before deduction for authorised undertakers' and to railway and tramway undertakers)			
Railway companies (not locomotive fuel)	8,200,000	7,700,000	
As well as use of the railways (locomotive fuel)	1,367,000	1,351,000	
Other (including use of the railways (locomotive fuel))	1,162,000	1,200,000	
Total (including use of the railways (locomotive fuel))	10,729,000	10,251,000	
Less: equivalent of home extracted fuel (expected, or shipped on account of domestic coal in foreign trade)	880,000	1,170,000	
Domestic coal (including minerals coal (approx.))	10,000,000	10,000,000	
General manufacturing and all other purposes	9,120,000	9,700,000	
Total		16,950,000	18,000,000

experts a widespread knowledge of means whereby the extravagant methods of consuming fuel which are widely prevalent might be so improved as to reduce the consumption for industrial purposes by a very substantial amount, there is, on the other hand, still so much inertia on the part of the consumers that even the simplest and most obvious steps towards improvement are not taken.

Whilst it is of little use doing research work, unless the results will be applied in practice, there is an enormous field still to be explored. The author proposes to deal briefly with the work of the Fuel Research Board. This Board, which was instituted in 1917, had perforce to attack the fuel problem mainly from the industrial point of view. It is an unfortunate fact that our fundamental knowledge of the behaviour of coal, when subjected to various treatments, is yet so incomplete as to render it imperative that a great deal of work should be done upon plant of full unit scale. In developing a process no assistance is available equivalent, say, to the method of testing by models, which has proved such a potent factor in improving the efficiency of the steam

thus temperature. Using the most reliable information existent, it was concluded in the laboratories, and indeed was shown on a laboratory scale, that if the coal were subjected to temperatures of 360° C., robust briquettes should result from most coals at a pressure of 2 tons per square inch. When, however, this was applied to large-scale working, incipient decomposition was found to occur long before this temperature was reached, and this caused grave difficulties in the large-scale plant. On this account, further work was instituted in the laboratory, and it was discovered that the decomposition point of coal started, and indeed became serious, at temperatures more than 100° lower than had previously been believed.

It is apparent that this information has bearings in many other cases than that of the particular process referred to, for instance, that of direct briquetting at elevated temperatures, or of any processes where preliminary heating or drying is applied.

The recent work of Bergius and others on the "hydro-generation" of coal at high pressures and temperatures, while being of the greatest importance as pointing a

possible way of obtaining oil in large quantities from bituminous and other coals, is also likely to have an important bearing on our knowledge of the constitution of coal. Recent work at the Fuel Research Station has shown the possibility of conferring, by hydrogenation, marked coking properties on coals otherwise absolutely devoid of coking power. Coke has been made at the Station from non-coking coal without the addition of any substance other than an extremely small proportion of hydrogen. The importance of the field opened up for investigation in this direction cannot be over-estimated.

Another important direction, in which further knowledge is required, is the selective effect of various reagents, temperatures, pressures, or processes on different coal constituents.

Investigations, which have been recently carried out in several quarters, indicate that the inorganic constituents of coal cannot be taken as merely inert diluents. Some of these constituents have a marked effect on the behaviour of a coal or coke when carbonised or burnt. There is still much work to be done before we shall know which constituents have that effect. This leads to a consideration of the methods of purifying coal. After a coal has been through a cleaning process, the ash-forming constituent will not only be reduced, but its composition will also differ from that originally present, and it may well happen that this change is of importance. The methods of cleaning coal have been developed by trial and error, and little is known regarding the real basis underlying some of the processes. Here again is an opening for valuable investigations, and the problem is being taken up, both at the Fuel Research Station and elsewhere.

It has been found that the size of the coal charged to retorts and coke ovens has a marked effect on the products, or on the ease of working, partly due to its effect upon the transference of heat to the charge. Physicists can tell us something of the laws governing heat transference by conduction, radiation and convection to and through more or less homogeneous bodies, but coal is such a heterogeneous mixture, and the conditions of heating are so complicated, that theory alone cannot be relied upon.

Were the investigation of all the problems so far touched upon far more advanced than is the case, we should still be unable to apply our knowledge satisfactorily without a detailed knowledge of the individual coals. It is well known that, while a coal seam may remain fairly constant in its properties over a wide area, different seams vary widely from each other. What has been, perhaps, less fully realised is that in nearly all cases the different layers in a single seam, even if only a narrow one, also differ widely from each other. These variations should be known in some detail before the method of mining, cleaning, grading, and blending best suited to the coal as it occurs, and the use to which it is to be put, can be stated. It is the object of the Physical and Chemical Survey of the National Coal Resources to provide information on this side. This Survey forms one of the most important activities of the Fuel Research Board, and is being pushed on as rapidly as the provision of the necessary staff and the frequent difficulties of the mining industry admit.

Enough has been said to emphasise the importance of systematic study in extending our knowledge of the constitution of coal in the broad sense, but a note of caution must be sounded regarding the necessity of such work proceeding on a systematic basis. In the past a large amount of so-called fundamental work has been of the nature of empiricism on the small scale, and has been of little, if any, value, or, indeed, has sometimes been positively misleading. Such work should only be undertaken by those who can free their minds from prejudice and view the matter in an impartial manner, taking into consideration the work of others, who may be looking at the subject from somewhat different angles.

It is of vital importance that a proper use should be made of our bountiful coal resources. In the first place, existing knowledge must be applied to a much greater extent than hitherto. Research work on a large scale will always be required, but the labour and expense of such work may be materially reduced in the future by further knowledge of the fundamentals, both of the materials and the processes. In this way grounds for controversy will be removed, and the energies of those interested may be devoted more to work and less to talk than, unfortunately, is the case at present.

THE UTILISATION OF OUR COAL SUPPLIES*

By PROF. J. W. COBB, C.B.E., B.Sc.

THE ideal utilisation of our coal supplies would necessitate the complete realisation of the potential thermal and chemical values of coal, without the emission of smoke. Burning raw coal is an obvious failure to realise the ideal, and we are in revolt against it. On the other hand, if coal is carbonised, the two principal products, gas and coke, are smokeless fuels, while the tar and ammonia are valuable chemical by-products. Carbonisation is a standard industry, as carried out in gas works and coke ovens, and there are other well-known processes of gasification.

The position at present may be stated thus:—In 1924, according to the report of the Secretary for Mines, the allotment of 180 million tons of coal available for home consumption may be made approximately as 16·7, 7·7, and 100·3 million tons for gas works, electricity generating stations, and domestic use, respectively, and for the carbonisation industries, taken together, gas works and coke ovens, 32·9 million tons. It is interesting to consider what are the factors at present limiting the applications of carbonisation or similar processes to the great bulk of our coal supplies, and what is being done, or may be done, to remove those limitations.

One feature common to all such processes of treating coal before burning it, is that they entail thermal and monetary expenditure, and the success of the treatment under ordinary economic conditions depends upon whether the expenditure is justified by the enhanced value of the products. Unless that condition is satisfied, the wide and increasing adoption of a process is impossible.

* Paper read before Section G of the British Association at Leeds on September 2, 1927.

The enhancement in value of the products has been sought in several ways. If a valuable by-product with a ready market is forthcoming in large quantities, that may in itself justify the process. Thus, the large yield of liquid fuel obtainable by such a process of hydrogenation as that of Bergius, may cover the cost of hydrogen and the provision and working of an apparatus which has to be maintained hot under enormous pressure. Again, the motor spirit obtainable from our own coal supplies may be sufficiently valuable to justify a catalytic treatment of water-gas and hydrogen, necessitating a preliminary carbonisation of coal and gasification in steam of the resultant coke. The Mond process of gasifying coal in steam and air was largely based on the very high yield of sulphate of ammonia obtainable. Such dependence upon the value of a particular chemical by-product is not, however, a feature of the normal process of carbonisation and gasification as carried out in gas works, coke ovens and producer plants, the position of which may now be examined.

Beginning with carbonisation, and taking thermal efficiency first, the carrying out of this process does not necessarily involve any large expenditure of the potential heat of the coal carbonised. In a gas works, for every hundred heat units contained in the coal, 75 to 80 should be available in the gas, coke and tar produced, after heating the retorts with a portion of the coke. In the most modern plants, using waste heat boilers, an efficiency of 80 to 85% has been obtained. The immediate thermal expenditure of, say, 20% in the process, does not, however, represent an ultimate thermal loss, because it is more than covered by the greatly enhanced value for most heating purposes of each heat unit carried in the gas, as compared with that of a heat unit in the coal. From the purely thermal standpoint, therefore, the gas industry is in a strong position, and its progress can be readily comprehended. Gas and coke go far to replace raw coal for most domestic, and many industrial, purposes, and they have advantages, to which I need not now refer further, apart from thermal efficiency.

At the same time, we have to recognise that in the replacement of coal by carbonised fuel for many large uses, of which steam raising for electrical generation or other uses may be taken as an example, a limit is imposed by the monetary cost of carbonisation (and gasification) in its present form. The outstanding technical factor limiting the economies of carbonisation seems to be that of speed in operation. I might point out briefly at this stage, that the burning of carbon by air at the temperature of a good boiler fire can take place at a speed which is limited solely by the rate at which air can be brought into effective contact with the carbon. Combination is, to all intents and purposes, instantaneous and complete. The position is quite different in carbonisation, and even in such processes as the gasification of coal in steam and air in a producer for the manufacture of producer gas, or of coke in steam for the manufacture of water gas. There, the processes of heat penetration and the reactions of gasification are very much slower. The consequence is that much higher expenditure on the plant and its working, per ton of coal, have to be incurred.

It is not strange, then, that in one way and another, a vast amount of work is being applied to determine how these reactions of coal and coke, other than their direct burning in air, can be accelerated. Let us consider carbonisation from this point of view. In the case of an ordinary plant, the heat has to be transmitted through the wall of a fireclay retort, and then through the mass of coal. It is a slow process. The retort, for high-temperature working, is made of fireclay of low conductivity. Heat in penetrating the coal is partially conducted by the solid, and partly radiated across spaces between the solid particles. Some heat is also convected from point to point of the charge by the gases evolved during carbonisation. The condition of affairs is complicated, since it is not only heat transmission which is important, but also keeping the charge in such a condition that the volatile products may be evolved as easily and escape as quickly as possible. Such considerations are responsible for much experiment in design and treatment. Narrower retorts or tubes have been tried, and fireclay replaced by the iron employed in the older days of the gas industry. Careful inquiry has been directed to find the type of iron which will not suffer from the growth and distortion which ruined the old retorts. Other alloys, such as "Cronite," have been used experimentally with considerable success, as I can say from first-hand experience, although the cost of "Cronite," is too high to allow of its general use in large-scale work.

The use of metal as compared with such refractory materials as fireclay or silica has, however, one disadvantage, in the sense that it imposes a much lower limit upon the temperature of the combustion chamber, which has the effect of lowering the temperature head available for rapid working. The present tendency in gas works and coke-oven practice is to use a high quality of refractory material, usually silica, in order to get as high a temperature head as possible between the combustion chamber and the charge. There is much to be said for seeking to produce the material sometimes known as semi-coke, containing a certain proportion of volatile matter, not by simply carbonising of set purpose at a lower finishing temperature (what is usually understood by low-temperature carbonisation), but by rapid incomplete carbonisation at a high temperature. To bring that about, everything must be done to facilitate penetration of heat and the escape of volatile matter. The condition of the charge at every period of its carbonisation should be the best possible.

The nature of the coal, its manner of fusion, the rate of escape of volatile matter, and the degree of its contraction and expansion, are all important. The transmission of heat by conduction through the solid depends directly upon temperature differences, but the radiation of heat across intervening gas spaces increases much more rapidly than the temperature. The heat transmission by conduction and radiation varies very much with temperature, and also with the size of gas spaces. Heat convection by the gases, as has been mentioned, comes into play. Moreover, although the carbonisation process, considered as a whole, does not either absorb or evolve appreciable

amounts of heat, the reactions occurring at one range of temperature are markedly exothermic, and at another endothermic, which must have its effect on the heat transmission between the cooler and hotter portions of the charge, usually the inside and the outside layers, respectively.

The position is too complicated to allow of any satisfactory exploration, except by direct and systematic experiment on the influence of each variable taken in its turn. Hence, the work which is on the way to determine the behaviour of coal of different kinds, caking and non-caking, swelling and non-swelling; the influence of the size of the pieces of coal used, either when one size alone is employed, or sizes in admixture; and the possibility of blending coals so as to secure better behaviour from a mixture than either would give separately; all these at different temperatures and rates of working. It is not simply necessary to study what are the differences obtained when carbonisation is complete, but also the larger differences which often declare themselves earlier in the process, when only a partial carbonisation has been effected, because, as has been already indicated, such partial carbonisation may be enough for many purposes, and indeed may be the only form of treatment economically practicable for many uses. Useful results have been and are forthcoming from such investigations, but more radical methods of speeding up carbonisation can be employed if the solid coke can be accepted in powdered form, as it can, for example, nowadays for the raising of steam by dust firing. The problem of heat transmission is enormously simplified in this case, because radiation and convection can be made so quickly operative upon the surface of every particle.

Mr. Sinnatt, of the Fuel Research Board, has shown how each individual particle of coal responds to the stimulus of heat by the rapid formation of a little bulb or cenosphere. This principle is receiving large-scale investigation in the McEwen-Runge process, in which the transmission of heat to each particle is facilitated not only by the fine sub-division of the coal, but by causing the particles to descend through an ascending current of hot gas, which acts as a heat carrier and carbonises them by direct contact. The imparting of heat by using a current of hot gas is a feature of several new proposed processes. In another process, that of Piron, the heat is transmitted to the powdered coal by the contact of molten lead. Rapid carbonisation in a revolving cylinder was carried out by Yeadon, of Leeds, in 1889, and is now being thoroughly tried out.

I would like now to speak of something more speculative in character, but worthy, I believe, of consideration. It is open to us to make progress not solely by an alteration of the thermal and mechanical treatment of coal, but, by modifying, if we can, its chemical behaviour and reactivity. We need not assume that coal, as it has been naturally deposited, is in the best chemical condition for use, and that there are no practicable means of stimulating its reactivity—of inducing a different behaviour in carbonisation from that natural to the coal as it is mined, and imparting where desired greater reactivity to the resulting coke. How far is it practicable to catalyse the reactions with which we are

concerned in the carbonisation and gasification of coal? Dr. Lessing has pointed out that the behaviour of coal on carbonisation in the laboratory is affected materially by the presence in small quantities of many inorganic compounds, and Haber suggested that the ash of coal might catalyse the reaction of gasification in steam.

Further investigation has shown clearly that if one considers such oxide constituents as commonly occur in the ash of coal, alumina and silica, which usually occur in the greatest quantity, these have little or no effect, but lime, oxide of iron and soda materially influence the process of carbonisation. This is very apparent on the laboratory scale, where much finer grained, stronger, and more homogeneous cokes have been produced by the addition of 5% of these materials. The full explanation is not forthcoming, but it would appear that the evolution of volatile matter during the plastic stage is slowed down, and the puffing-out and honey-combing of the coke lessened on that account. On the larger scale, these special cokes are, however, not obviously different in structure from pure coke made without additions, presumably because the process is in any case so much slowed down that the differences are smoothed out. It is likely that in processes of rapid carbonisation on any scale, they will be retained. There are some interesting points in the larger scale results. Thus, the gas yield was increased 20% with a sodium-carbonate coke, and the ammonia yield by 35%, with a calcium-carbonate coke. But what is of greatest importance from our present standpoint is the interesting change which has been brought about, on either the laboratory or the large scale, in the properties of the coke by these additions. The following are one or two illustrations: On gasification in steam, the laboratory equivalent of the water-gas process, the cokes made with alumina and silica additions behaved exactly like the pure coke, but the cokes made with lime, oxide of iron and particularly sodium carbonate, behaved quite differently. They gasified much more quickly, and gave a much better water-gas.

It may be pointed out that as the rate of steam passage through a bed of red hot coke is increased, some of it begins to come through undecomposed, and the water-gas, instead of being practically all carbon monoxide and hydrogen, contains carbon dioxide in gradually increasing quantity. With the pure coke in the laboratory apparatus at 1000° C., using 10 g. of coke, the gas made contained 5.2% of carbon dioxide (taken as a permissible amount) when the rate of steam supply was 2.5 litres per hour, and the coke was being gasified at the rate of 1.15 g. per hour. With the silica coke, the figures were practically the same. With the iron-oxide coke, the rate of steam supply had to be increased ninefold, to 21.9 litres per hour, with a coke gasification of 10.5 g. per hour, before the carbon dioxide in the gas amounted to 5%. With the calcium-oxide coke, a carbon dioxide content of 5.4 was obtained with a rate of steam supply of 11.2 litres per hour, and a coke gasification of 5.2 g. per hour. The figures obtained with sodium carbonate were even more remarkable. With a steam supply of 21 litres per hour, the carbon dioxide was only 4.4%, and in order to get 5% of carbon dioxide in the gas, it was necessary to make

the column of coke only one quarter of its original length.

It is plain from these figures, collected in the table, that the reactivity of coke to steam was so far enhanced by the additions, that the rate of working could be increased tenfold, or more without impairing the quality of the gas made. These results were obtained working at a temperature of 1000° C. At lower temperatures the influence of the added constituent was, in some ways, even more remarkable. It is to be remembered that the maintenance of such a temperature as 1000° C. in all parts of the fuel bed, in many gasification processes is not practicable and that, for example with steam, the rate of gasification falls off rapidly with temperature, and the quality of the gas made is lowered by the production of more carbon dioxide.

Gasification of special cokes in steam and carbon dioxide

Coke used	Weight of coke in g.	Gas entering	Rate of gas entering in litres per hour	Rate of coke gasification in g. per hour	CO ₂ in gas leaving in g.	CO in gas leaving in g.	Temp. of bed in °C.
Pure	10	Steam	2.5	1.15	0.2	-	1000
5% Fe ₂ O ₃	10	"	21.9	10.5	5.0	-	1000
5% CaO	10	"	11.2	5.2	5.4	-	1000
5% Na ₂ CO ₃	10	"	21.0	10.4	0.4	-	1000
" Pure "	10	"	19.0	9.8	0.8	-	1000
5% Na ₂ CO ₃	10	"	10	5.8	1.7	-	800
" Pure "	10	CO	6	6	17.8	-	1000
5% Fe ₂ O ₃	10	"	6	6	91.0	-	1000
CaO	10	"	6	6	95.0	-	1000
Na ₂ CO ₃	10	"	6	6	97.0	-	1000
" Pure "	10	"	6	6	11.0	-	900
5% Fe ₂ O ₃	10	"	6	6	70.0	-	900
CaO	10	"	6	6	64.0	-	900
Na ₂ CO ₃	10	"	6	6	82.0	-	900

Perhaps one of the most striking examples of the influence of an added constituent was obtained by the comparison of the behaviour, at 800° C., of a pure coke and a sodium-carbonate coke, with the steam supply at 10 litres per hour to 10 g. of coke. With pure coke 0.9 g. of coke was gasified per hour, yielding a gas containing 18% of carbon dioxide. With the sodium-carbonate coke, 5.8 g. was gasified per hour, and the gas made contained only 1.7% of carbon dioxide, which represents six times the rate of gasification with only one tenth as much carbon dioxide in the gas. This enhanced reactivity of coke towards steam is obviously of direct importance for the making of water-gas, and the steaming of coke in gas retorts, and also in nearly all gas producer practice where coal and coke are gasified in air and steam, since even if the producer is charged with coal, as is most commonly the case, expulsion of volatile matter at the top of the producer soon converts the coal to coke, and it is the gasification of coke with which we are concerned, as responsible for the great bulk of the gas made.

When, however, as in the gas producer blown with air alone, air is the gasifying agent, the fundamental limiting factor in the rate of gasification is the reactivity of the coke to carbon dioxide. The rate of blowing with air can easily be increased with the production of carbon dioxide at the grate, but unless the coke above it can reduce that carbon dioxide to carbon monoxide, excessive heat is generated in the producer itself, and largely lost, while the producer gas is high in carbon dioxide and of low quality. I might mention, incidentally, that for those uses in which the generation of the

maximum amount of heat in the fuel bed is required, the less reactive coke would be the better, but the requirement of gas-producer practice is the opposite: as much heat as possible is wanted as potential heat of combustion in the gas leaving the producer.

It is plainly then an interesting point as to whether the same stimulation of reactivity towards carbon dioxide can be secured in these special cokes as towards steam. This has been investigated, and it has been shown that the stimulation of reactivity in the special cokes towards carbon dioxide does occur, although, in some cases, there seems to be a falling off after a time which has not been noted with steam, and is being further examined. Passing carbon dioxide over coke at 1000° C. under such conditions that pure coke gave only 47.8% of carbon monoxide, the iron oxide, lime and sodium-carbonate cokes gave 93, 95 and 97% of carbon monoxide respectively. Similar effects were obtained at lower temperatures. The figures quoted above have been in every case for 5% additions, but experiments made with small quantities show that useful effects can be obtained thereby in a more than proportionate measure.

In bringing these particular results forward I would emphasise that they are not intended to represent the working out of a technical process, or the completion of laboratory investigation. They do seem to me to be suggestive. They do seem to demonstrate that we should make a mistake if we did not keep our eyes fully open to the possibility of speeding up the processes employed for the utilisation of coal to an extent which it is quite impossible to forecast.

Summarising, my main thesis is that one great reason militating in practice against the replacement of the direct burning of coal by methods which would be more scientifically, economically, and hygienically satisfactory, is that none of the other processes of transforming coal is anything like so rapid as that of direct burning. Consequently, much is being done, and more remains to be done, in investigating, on the laboratory and on the large scale, how the speeding up may be effected. The investigation is necessarily taking many forms, through the design of apparatus, the study of the nature of coal in the molecule and in the mass in order to understand its potentialities under many thermal and chemical conditions, and enquiry into the possibilities of modifying the properties of coal in directions found desirable by suitable additions.

THE CHEMISTRY OF COAL*

By PROF. R. V. WHEELER, D.Sc.

WHEN reviewing, some years ago, the knowledge then available regarding the constitution of coal, Dr. Marie Stopes and I suggested that, in view of the number and apparent complexity of the plant materials that had contributed to its formation, the rational mode of study of coal would be to determine separately the character of the contribution made by each of the more important individual coal-forming materials of plants. We outlined the programme of research that we proposed to follow at the meeting of the British Association at

* Paper read before Section G of the British Association, Leeds, September 2, 1927.

Newcastle-upon-Tyne in 1916. Such a mode of attack has of necessity taken a long time to develop, and it has not yet yielded all the results desired. Nevertheless, the work has reached a stage at which a review of progress can profitably be made. This paper is intended to present such a review.*

Coal-forming materials.—The various plant entities and residues that have contributed to the formation of the organic substance of coal can conveniently be grouped according as they are :—

(1) Resistant to decay. Amongst the more important members of this group are :—(a) Spore exines and cuticular tissues ; and (b) resins

(2) Subject to decay. The members of this group are either :—(a) Organised, such as cellulosic and lignified tissues ; or (b) amorphous, the contents of plant cells

(3) The products of decay. The ulmins

An accumulation of plant remains immediately after deposition consists mainly of the first two groups, but in an older deposit, such as a peat bed, whilst the members of group (1) are still present in an apparently unaltered form, the celluloses and lignin of group (2) have suffered decay, undergoing such minor alterations as dehydration produces, or becoming converted into ulmins (probably in conjunction with certain of the cell-contents), or disappearing altogether. Judging from the nature of peat, the formation of ulmins is the main chemical process during the decay of plants, and it becomes more pronounced the older the deposit. Thus, whilst a young peat may yield only 10 or 20% of ulmin material soluble in alkalis, from an older peat as much as 70 or 80% can be extracted.

In a deposit of the age of coal, it cannot be expected that the materials of any of the three groups will remain unaltered. Spore exines and cuticular tissues may not be much changed, nor need the resins, but the cellulose that is not totally destroyed will, in large part, be converted, together with the more resistant lignin and part of the cell contents, into the amorphous ulmins of group (3), or products derived from them. There will also be material corresponding with group (2) (a), consisting of altered woody tissues (not, apparently, converted into ulmins), such as compose many lignites and are recognisable in many bituminous coals. Cell wall structures, group (2) (a), as they finally appear in the coal, may not differ much chemically from the amorphous ulmins, but the materials of group (1) differ markedly.

It is therefore to be expected that, chemically, coal will be divisible into two main groups of substances differing considerably from each other : the one composed of the resistant plant materials, perhaps in a somewhat changed form, the other the ulmins derived from the less resistant cellular structures and cell-contents. It has been suggested that a third specific group, of nitrogenous substances, should also be present, but no evidence of such a group has been obtained, and it appears that the nitrogenous compounds in plants contribute, as the result of chemical combination, to the ulmin group.

Major constituents of coal.—By whatever means the constitution of coal is studied, evidence is obtained of the presence not of an indefinable mass of chemically heterogeneous *débris*, but of only a few well-defined types of materials. For example, early work on the behaviour of coal on destructive distillation, showed clearly the presence of two distinct groups of compounds, the one yielding a little phenolic tar, and much water, oxides of carbon and hydrogen, the other yielding mainly hydrocarbons, liquid and gaseous, and presumably resinic in nature. Again, a comparison of the properties of the bright and dull components (usually termed vitrain, clarain, and durain) of banded bituminous coals, has shown relationships between the several bright and dull bands, from which the logical deduction can be drawn that but two main types of materials form the major part of a bituminous coal. Such a comparison gives a clearer idea of the character of the constituents than can the results of destructive distillation of coal as a whole, and an extension of the comparison to include peat enables the two types to be recognised as (a) ulmins ; and (b) plant materials resistant to decay and to chemical treatment.

The general nature of coal is, however, best shown by its behaviour under mild but prolonged oxidation, which converts bituminous coals partially or almost wholly, according to their nature, into alkali-soluble substances, leaving a residue that varies in amount and in character, according to the nature of the coal. This residue is composed mainly of spore exines, with some cuticles, resins and particularly resistant woody tissues (including fusain), representatives of the non-ulmined resistant plant materials, one of the two major groups of coal constituents. These resistant materials have retained their morphological structures and, to a large extent, their chemical characteristics, throughout the process of coalification.

The alkali-soluble material is derived from the other main group of constituents of bituminous coal—the coal-ulmins. The coal-ulmins are themselves insoluble in alkalis, but oxidation renders them soluble, presumably by reason of replacement of some of the external groupings of the molecules by carboxyl. The alkali-soluble ulmins, produced from a bituminous coal on oxidation, are definite types of compounds, not mixtures of dissimilar types, which attain a nearly constant composition (C 62.65 ; H 2.53 ; O 32–35, N 1–2%) when the oxidation has been carried sufficiently far, whether the portion of a coal from which they are obtained be vitrain, clarain or durain. This uniformity of product is evidence of the uniformity in character of the material from which it is derived, namely, the insoluble coal-ulmin which forms the bulk of most coals. Moreover, the composition of the alkali-soluble ulmins, produced on the oxidation of coals, remains constant over a wide range of coals of different rank, indicating the presence of a similar type of material throughout such a range of coals. Actually, the coals differ as regards the ease with which alkali-soluble ulmins are produced from them, and it is probable that the differences in rank of coals are mainly due to modifications in the readily oxidisable and replaceable external groupings of the coal-ulmin molecules. The most

* Details of the researches briefly referred to are given in a series of papers in *The Journal of the Chemical Society*, e.g., 1910, **97**, 1917, **191**, **99**, 649, 1914, **105**, 131 ; 1916, **109**, 707 ; 1922, **121**, 2345 ; 1925, **127**, 1115, 2236, 1926, 1410, 1927, 700.

obvious example of a difference of this nature is obtained on comparing peat with bituminous coal. The ulmins, as they exist in peat, are soluble in alkalis, but they possess a similar nuclear structure to that of the coal-ulmins, which have undoubtedly been derived from materials akin to the peat ulmins. The loss of solubility in alkalis, which differentiates the peat-ulmins from the coal-ulmins, is the first of the changes indicated in the changing rank of coals.

The ready separation of the coal-ulmins from the resistant plant *debris* permits a rational analysis to be made of coal. Such a rational analysis is particularly interesting when applied to the several components of a banded bituminous coal. Thus, the analyses of the four component bands of the Hamstead coal, a markedly-banded bituminous coal, can be expressed as in Table I.

TABLE I
Analysis of component bands of Hamstead coal

Ulmmin compound-	Organised plant entities	Hydrocarbons and resins	General character of plant entities
Vitram	96	Nil	Cuticles and pore canals Cuticles, spore exines and woody tissues
Claram	92	5	
Durain	84	16	
Fusain	20	80	

For complete definition of the coals, a further expression, indicating the rank of the ulmin compounds, is required.

Chemistry of the coal ulmins. The insoluble coal-ulmins are held to be of one general type, for the alkali-soluble compounds produced by their mild oxidation are of uniform composition, which is the same whether they are obtained from the vitram, claram, or durain portion of a banded bituminous coal. It might be argued that these alkali-soluble ulmins are uniform mixtures of several types of compounds. There is no evidence of this. On more drastic oxidation, products derived from the nuclear groupings of the molecules are obtained, and the breakdown is progressive, giving no indication of the presence of compounds of different degrees of stability. For example, nitrogen appears to be distributed, in firm combination, throughout the nucleus of the ulmin molecule, and, on the breakdown of the nucleus, is eliminated *pro rata* with the carbon. No selective breakdown, with the survival of nitrogenous or non-nitrogenous molecules, can be detected.

The similarity of the alkali-soluble ulmins, obtainable from the several components of a banded bituminous coal, or from a number of coals of not too widely different rank, indicates that their nuclear structure, and that of the insoluble coal-ulmins from which they are derived, is the same. The alkali-soluble ulmins differ from the coal-ulmins with respect to their external groupings, which are mainly carboxylic, and have been produced by the oxidation of the external groupings of the coal ulmins, which may vary from coal to coal.

The stability of the nitrogen (and sulphur) in the oxidised ulmins indicates that these elements enter into the nucleus of the molecule. Further oxidation (by hydrogen peroxide or dilute nitric acid) yields products, such as mellitic and other benzene carboxylic acids, picric acid, dinitro-resorcinol, succinic and oxalic acids, derived from both six-membered carbon rings and

furan structures. The nuclear structure of the ulmin molecule may, therefore, be pictured as composed of hexacyclic carbon rings, linked by furan rings in which the oxygen may be replaced by nitrogen or sulphur.

Chemistry of the resistant plant remains.—(a) *Spore exines and cuticles.*—Spore exines and cuticles exist in coal in a form but little changed, either physically or chemically, from that which they possessed originally. The most marked features of these materials, as befits their purpose as protective coverings to delicate tissues, are their waterproof nature and their resistance to either chemical, fungal or bacterial attack. The exines and cuticles that can be isolated from coal, by resolution of the conglomerate with hydrogen peroxide, are found to have suffered but little from bacterial decay during their transformation into coal, or from the chemical treatment to which they have recently been subjected. They bear a close similarity, chemically, with corresponding structures from modern plants.

Though considered together here, cuticles and spore exines are not identical in chemical constitution. Both, however, are closely related to the oily and waxy constituents of plants, from which they were no doubt derived by oxidation processes. On destructive distillation, they both yield a high proportion of tar (from 40-60% by weight), with but little gas. The tar consists mainly of hydrocarbons. The proportions of organised plant entities present in coal varies from 1-5% in a claram up to 25 or 30% in a durain.

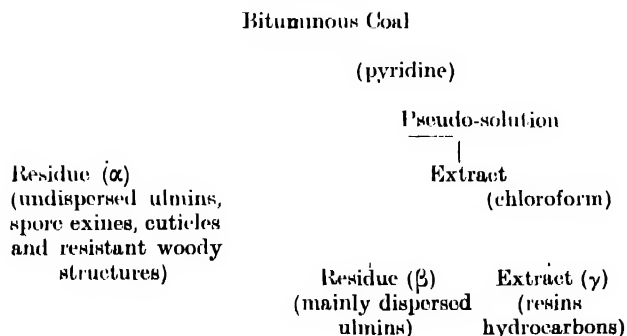

(b) *Resins.*—The resins, because of their resistance to decay and, to a less extent, to oxidation, are here grouped with the "resistant plant remains," though they differ profoundly from the spore exines and cuticles. Resins are difficult to define, but may perhaps best be regarded as the waste products of plant life, related to (oxygenated derivatives of) the terpenes. They are associated with the plant, not only as exudations, but distributed throughout the cell-structures. Resins can be isolated from some coals amongst the residue remaining after the oxidised ulmins have been dissolved in alkalis. They then appear as amber-coloured drops or rodlets, such as can be observed, in position in the plant tissues, in transparent sections of coal. Probably only a fraction of the total resins survives the oxidation treatment of coal employed to isolate them, and they are best obtained by extraction with suitable organic solvents. As thus obtained, they closely resemble the more resistant present-day resins in composition, behaviour on destructive distillation, and general properties. A typical example of a resin extracted from a bituminous coal contained C 84.0 and H 7.2%, and belonged to the class of resins termed "resenes": a saponifiable ester resin was associated with it. On destructive distillation, the coal resins give a comparatively small yield of gas, mainly paraffin hydrocarbons, with about 50% of tar, also mainly hydrocarbons. The amount of resin obtainable from bituminous coals varies, but is generally between 2 and 5%.

(c) *Hydrocarbons.*—Hydrocarbons enter into the composition of plants, e.g., associated with the cuticles, but not in any large proportion. Coals sometimes contain

free hydrocarbons in greater amounts than can be thus accounted for, and it is probable that they are mainly derived, during the later stages of coalification, from waxes and fatty oils (themselves absent from bituminous coals) originally present in the plants. The hydrocarbons are most readily isolated from coal by the selective action of solvents. Both saturated and unsaturated hydrocarbons, up to 4 or 5 %, have been so isolated. The bulk of the free hydrocarbons present in coal distills unchanged and thus contributes to the tar.

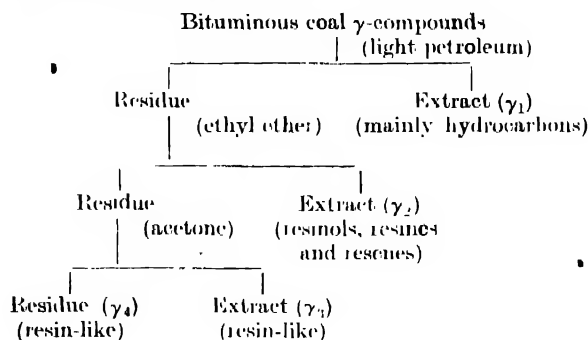

Extraction of coal by solvents.—Bituminous coal can be resolved by means of boiling pyridine, followed by chloroform. The portions (α) insoluble in pyridine and (β) soluble in pyridine but insoluble in chloroform are of similar type, but are distinct from (γ) the portion soluble in both pyridine and chloroform. These fractions have been termed "cellulosic" (insoluble in chloroform) and "resinic" (soluble), as indicating their probable origin, but they are now commonly referred to by the non-committal labels α , β and γ . Pyridine (for a short time in dislayour as a means of resolving coal, on the ground that its action might be chemical) causes a mechanical dispersion of the colloidal ulmin material (and to some extent, perhaps, of the resins), allowing of the more ready subsequent action of other solvents. Its use for coal extraction is to be preferred to that of benzene under pressure, a method that has sometimes been adopted because of its more ready removal from, and detection in, the extracts and residues, which most tenaciously retain benzene. Moreover, it is more effective than benzene at low temperatures. The behaviour of the major constituents of coal towards solvents can be stated as follows:—*Coal-ulmins*. Insoluble. Partially dispersed by pyridine (and several other solvents). The readiness with which dispersion occurs appears to be related to the rank of the coal. *Resistant plant remains*. (a) Organised plant entities, e.g., spore exines: Insoluble. Associated fats and waxes, if present, readily soluble in most solvents. (b) Resins: Soluble in such solvents as chloroform and ether. (c) Hydrocarbons: Readily soluble in most solvents.

The effect of resolving coal by pyridine and chloroform can, therefore, be expressed thus:—

The γ -compounds can be further separated by organic solvents, a suitable sequence being light petroleum, ethyl ether and acetone. Each of the fractions so

obtained has distinctive properties which enable them to be specified according to the following scheme:—

An example of the resolution of a bituminous coal according to this scheme, to show the proportions in which the various compounds are present, relates to coal from the Parkgate seam, a typical South Yorkshire coking coal, having analysis: C, 83.6; H, 5.46; O, 6.75; N, 1.72; S, 2.47; per cent. on the ash-free dry coal. By treatment with pyridine and chloroform, the proportions of α -, β - and γ -compounds obtained were 75.8, 17.3 and 6.9 %. Further resolution of the γ -compounds, in the manner described, gave the results shown in Table II.

% on the ash-free dry coal		Analysis, %			
		C	H	O	N
γ_1	2.3	83.90	30	6.74	6.36
γ_2	2.51	82.72	30	6.91	9.47
γ_3	0.83	79.00	70	0.89	14.41
γ_4	1.23	80.00	90	1.10	13.00

The distillation of coal.—When attempting to deduce the character of coal from its behaviour on heating and from the products of its distillation, two main difficulties are encountered. Coal being a heterogeneous substance, the effects observed when it is heated may be compounded of the effects produced by each ingredient independently, whilst the primary products of distillation may be subject to secondary decomposition. The latter difficulty can be largely overcome by adopting suitable measures to remove the primary products of decomposition, at carefully regulated stages, as rapidly as they are formed. Valuable information has been obtained in this way. Destructive distillation of coal *en masse*, however, fails to disclose the individual contributions of the various constituents, though broad generalisations can be made regarding the character of the types of compounds responsible for the major effects—obvious stages of decomposition—observed.

Thus, at low temperatures there is an evolution, almost exclusively, of oxides of carbon and water, which, by analogy with the behaviour of carbohydrates on destructive distillation, have been assumed to come from those portions of the coal that are derived from the various celluloses. At moderate temperatures the decomposition products are mainly hydrocarbons, both liquid and gaseous, such as might be yielded by "resinic" material. At high temperatures the products are mainly hydrogen and the oxides of carbon, from the "cellulosic" portion of the coal. These suggestions have received support from the results of distillations

of the several fractions into which coal can be separated by means of solvents.

Knowledge of the individual contributions of the various constituents of coal towards its distillation products can, however, best be obtained: (a) by the separate distillation of such individual substances as can be isolated, *e.g.*, resins and hydrocarbons (by solvent extraction), spore exine, and cuticles (by oxidation and treatment with alkali); (b) by comparison of the results so obtained with the result of distillation of modern plant materials of a similar nature; and (c) by a suitable choice of coals for destructive distillation, *e.g.*, the components of a banded bituminous coal or coal in which one or other ingredient is known to be concentrated in abnormal amount. The information obtained by these means can be summarised as follows.

The ulmins. The ulmin constituent cannot be separated from bituminous coal without modifying its character. Perhaps the nearest approach to a pure coal ulmin is a vitrain from which all resins and hydrocarbon material has been removed by extraction with solvents. Peat ulmins can readily be isolated, and their behaviour on distillation can be compared with that of extracted vitrains and oxidised ulmins prepared from them. Peat ulmins on distillation yield much water and a little phenolic tar, with, at higher temperatures, a large volume of gases, mainly hydrogen and the oxides of carbon. This behaviour is typical of the natural ulmins whatever their source. It is shown, also, by the synthetic ulmin (containing nitrogen) yielded by the interaction of amino acids and carbohydrates. These so-called "amino ulmins" are of considerable interest, not only because of their general similarity, in composition and behaviour, with the natural ulmins, but because they are derived from materials which occur amongst decayed and decaying plant accumulations, and are formed under conditions that can occur in nature.

The products of distillation of a vitrain closely resemble those of a peat ulmin, the main difference, a smaller yield of water and carbon dioxide, being attributable to loss of hydroxyl, carboxyl and other external groupings during the change in rank of the ulmin from that of peat to that of bituminous coal. The oxidised ulmins prepared from a vitrain yield greatly increased quantities of carbon dioxide (owing to the introduction of carboxyl groups), but the products of distillation, carbon monoxide and hydrogen at high temperatures and a phenolic tar, are otherwise characteristic of ulmins in general. As the ulmin constituent changes in rank with the carbon content of the coal, the products of distillation contain lesser quantities of water and oxides of carbon.

The resistant plant remains. Spore exine and cuticles, as already stated, yield between 40 and 60% by weight of liquid hydrocarbons. Resins partly distil unchanged and partly decompose, yielding gases (mainly paraffin hydrocarbons), and up to about 50% by weight of hydrocarbon tar. The resins extracted from coal (or separated from it mechanically) behave similarly to such fossil resins as have been examined. The hydrocarbons isolated from coal distil unchanged. By close

observation of the course of the distillation of a bituminous coal, it is possible to detect the independent decomposition of each of the ingredients: to note, for example, the early distillation without change (liquefaction) of the hydrocarbons, the later decomposition of the resins, and the main decomposition of the ulmin constituent. In general, therefore, it can be said that when a bituminous coal is distilled, the phenolic tars, water, and oxides of carbon and hydrogen produced are derived from the ulmin constituent. Gaseous hydrocarbons are derived in part from the ulmin constituent and in part from the resistant plant remains. Liquid hydrocarbons are yielded mainly by the plant remains.

Oxidation of coal. It has already been explained that the mild oxidation of a bituminous coal affords means of separating the major constituents, the ulmins and the resistant plant remains. From early work, the presence in coal of two main types of constituents has been deduced, the one "reactive," the other relatively "inert." It was demonstrated that the difference, chemically, between the vitrain, clavin, durain, and fusain of a banded bituminous coal lay in the proportions of "inert" material with which the "reactive" material in each was associated, the latter being of the same chemical composition throughout the banded coal. The later work, on the oxidation of coal, specified as the "reactive" group of compounds those that can be converted by mild oxidation into alkali-soluble ulmins, and as the "inert," those that remain insoluble in alkalis - the plant remains. The "reactivity" of the ulmin constituent of coal, as contrasted with the "inertness" of the plant remains, is displayed not only by its oxidisability, but by its behaviour towards reagents in general, its response to the dispersive action of pyridine, and to the action of heat, more particularly as regards the production of gases on distillation.

The mechanism of the atmospheric oxidation of the coal-ulmins seems to be, in sequence: (a) The adsorption of oxygen on the colloidal material; (b) the addition of oxygen to the external groupings of the molecule; and (c) the splitting off of external groupings and their replacement by carboxyl. Attack on the nucleus of the coal-ulmin does not begin until more vigorous oxidation than atmospheric is employed. The oxidisability of a coal thus depends on the nature of the external groupings of the ulmin molecules. The effect of the progressive condensation and elimination of external groupings from the ulmin molecules, as coals progress in rank, is seen in their gradual decrease in oxidisability.

General considerations. The materials, all forms of plant structures, that may have contributed to the composition of coal, are numerous and diverse in character. Except for certain specific substances, too small in amount to require consideration here, these materials are, however, substantially the same in chemical nature, though varying widely in form and in the relative quantities present, whatever the type of plant life to which they belong. The relative amounts of the different plant materials that ultimately form coal may be considerably altered by the conditions of their accumulation in the coal-forming beds. There will, for example, be

a tendency for the heavier woody matter, containing much lignin and cellulose, to be segregated from the lighter *débris*, such as spores and pollens, so that the resulting coal may show local enrichments of such bodies. Local contributions of different plant materials account for the commonly banded appearance of bituminous coals. The differentiation of such banded coals into physically distinct components—vitrain, clarain, durain and fusain—enables a study to be made of the extent to which local enrichments affect the properties of coals, for these components of banded bituminous coals differ from one another almost entirely because of the different contributions made to them by the various parts of plants. For proper understanding of the character of bituminous coal it is, in fact, essential to study each physically distinct banded component separately.

As a result of numerous researches on banded bituminous coals, it has become increasingly apparent that the great complexity of character of the initial coal-forming materials has not been transmitted to the resulting coal. During the process of coalification, and, as it would appear, mainly during the initial stages, those of decay of the vegetable matter, many of these more important components (in quantity) of the accumulated plant-material lose their identity, and by extensive alteration and interaction find a common level as "ulmin compounds." These ulmins form a definite class of compounds, not necessarily homogeneous, but probably comprising several distinct types, yet sufficiently alike in their chemical constitution and behaviour to justify their being grouped under one head. So far, no separation of the naturally-occurring ulmins into markedly different classes of compounds has been obtained experimentally.

The plant materials that contributed to the ulmin group of compounds are the structural portions, the lignin and celluloses of the cellular framework, together with much of the cell-contents, namely, carbohydrates and proteins. These materials formed the bulk of the plants, and the resulting ulmins form the bulk of coal. The predominance of ulmins is already apparent in an accumulation of plant *débris* after a comparatively short process of decay, *e.g.*, in peats, in which alkali-soluble ulmins are found in increasing amounts as the age of the peat increases. The ulmins, as first formed, are not permanent, unchangeable compounds, but are subject to progressive alteration according to the conditions to which they are subjected. This progressive alteration becomes most apparent in a decrease of solubility in alkalis, partial in the lignites, complete in bituminous coals. Over the whole range of coals, also, the ulmins progressively alter, more particularly as regards their ease of oxidation, as the "rank" of the coal increases. There is good reason for the belief that the rank of a coal is mainly determined by the change that has taken place (by such factors as pressure, temperature and time) in the ulmins it contains.

The parts of plants which do not undergo decay, with the formation of ulmins, are the protective coverings of plant tissues, such as the coats or exines of spores and the cuticles of stems and leaves, together with certain special plant products such as the resins. These are not readily subject to decay, and are not readily

altered by the conditions attending coalification, so that they are found in coal but slightly modified from their original forms, and in quantity greater than corresponds with their original proportions in the plant *débris*. There are also present in coal small quantities of free hydrocarbons, probably derived from the oils and waxes of the plants during the processes of decay and coalification. These three classes of plant materials, protective tissues, resins and hydrocarbons, though different in character, can conveniently be grouped together as "resistant plant remains." A normal coal can be regarded as essentially a mixture of the two groups of compounds, "ulmins" and "resistant plant remains." It can be confidently anticipated that, as the result of work now in progress, the nature of any coal can be related to (a) the character of its ulmin compounds, and (b) the contents and nature of its resistant plant remains, so that a rational classification can be obtained. There seems to be no possibility of compounding the influence of these two groups of materials, for their effects on the character of the coal composed of them are independent.

At present our knowledge of the extent to which each of these main component groups of compounds affects the behaviour of coal under different conditions is incomplete, but it is possible to relate one or other property broadly to the presence of one or other component. For example, in those reactions or coal which involve its oxidation, the ulmin compounds play the major part; whilst the behaviour of coal on destructive distillation, as regards its yield of tar, is determined mainly by its contents of resistant plant remains. The "coking-power" of a coal (its ability to yield a commercial coke) depends on too many factors to permit of its being related so simply to the presence of some "coking ingredient"; nevertheless, it should be possible to deduce the coking properties of a coal from its chemical constitution. The resins, and to a certain extent the hydrocarbons, appear to play the part of agglutinating materials, but it is clear that the character of the infusible part of the coal is of equal importance.

The applications of coal, beyond its direct use as a raw fuel, are steadily increasing as knowledge of its properties grows; yet there is no question but that its most economic use is hampered by lack of definite knowledge of its chemical nature. It is significant that, of the various schemes suggested for obtaining oil from coal, the one regarded by many as the most promising involves the complete breakdown of the coal molecules, with the formation of carbon monoxide and hydrogen from which oils are laboriously resynthesised. With the more complete knowledge rapidly being attained of the chemistry of the major components of coal, it is not too much to hope that direct advantage may be taken of their properties to put them to the use for which they are best suited.

THE DISCUSSION

In the discussion which followed the presentation of the papers by Dr. Lander, Prof. Cobb, and Prof. Wheeler, Dr. A. Parker considered that Dr. Lander rightly emphasised the necessity for more fundamental work, but it was not easy to decide what was fundamental

when considering such a complex substance as coal. There were many variables—size of coal, temperature, the origin of the coal, the nature of its ash, the rate of heating, the thickness of the layer heated, and so on—and these variables in combination would give rise to thousands of factors affecting the results. Prof. Cobb had pointed out that, in the economic development of carbonisation processes, speed seemed to be the determining factor, and had also referred to the carbonisation of coal in powdered form. He (Dr. Parker) thought that an important development in this connexion, and one worth further investigation, was the transfer of heat to the coal by the passage of heated gases through the retort. Improvements might also be made by using better conductors for constructing retorts than the usual refractory materials. For the efficient utilisation of coal, there might be better co-operation between the carbonising and other industries; some of the coke produced in the gas industry was in the form of breeze or dust which might be employed for steam raising in electric power stations. Breeze was used for that purpose in the gas works, but the gas industry was now giving greater attention to waste-heat utilisation, and more breeze would be available for other industries. It was in this direction that the greatest step could be made to make use of the fundamental work in the near future.

Mr. A. Lupton, criticising the figure of 180,000 million tons given by Dr. Lander as the quantity of coal remaining in Great Britain, said the amount was probably twice as great. Mr. C. E. Stromeyer referred to a process used in Silesia for drying lignite, which contained 30–40% of water as mined, and when dried in the ordinary way completely disintegrated. It had been found, however, that by placing the lignite in vessels of water, gradually heating the water to boiling point, and then draining it off, the lignite subsequently contracted in drying without disintegration. Mr. Stromeyer further observed that, as powdered coal could now be burned efficiently, it might be possible to use some of the existing thin seams of coal if some form of scraper conveyor could be devised to extract the coal from such seams in the form of dust. If that were practicable, our coal resources would be doubled.

Prof. Sir T. Hudson Beare remarked that the use of pulverised coal would prevent the production of smoke in power plant, but could not be applied to domestic fires. He hoped that low-temperature carbonisation would assist in that respect. Prof. F. C. Lea said that many metallurgical problems must be solved before carbonisation processes became economical. During the next few years it would be necessary to give more consideration to the use of the gaseous products of carbonisation processes for domestic and industrial heating, and to use powdered coke for boiler firing. Dr. J. S. Owens, dealing with the use of gas for domestic heating, remarked that with gas heating little air was taken from the room, whereas an open grate gave good ventilation. A fuel was wanted which would burn smokelessly in the open grate; existing grates could be modified to burn gas coke.

Replying to the discussion, Dr. Lander remarked that many of the heat-transfer processes to-day seemed to be

working at minimum efficiency. The figure of 180,000 million tons as the coal reserve of this country was taken merely to calculate the equivalent amount of oil, and if the coal available was greater than he had assumed, the oil equivalent was correspondingly increased. He agreed with Prof. Hudson Beare's remarks about pulverisation, and added that the importance of the domestic fuel problem was fully realised. The metallurgical problems, mentioned by Prof. Lea, were most difficult, not only in connexion with carbonisation, but in many other industries. It was largely a question of obtaining heat-resisting metals much cheaper than those at present available. Metallurgists might well pay more attention to cast iron, as a 20% improvement in its heat-resisting properties would render possible many processes which could not be worked economically to-day.

Prof. Cobb, in his reply, agreed with Dr. Owens as to the importance of ventilation, and that the open fire was not only a heating but also a ventilating appliance. The solid-fuel fire was likely to have a very long life yet, and one important reason for this was that it formed a useful domestic refuse destructor. A solid-fuel fire did not, however, necessarily mean a smoky fire, if smokeless solid fuels were used. He was sorry that Dr. Owens had suggested that a gas fire was not an effective ventilator; if a room heated by a gas fire was not well ventilated the fire could not have been properly fitted.

CANADIAN INDUSTRIAL NOTES

The large pulp and paper mills, built a few years ago on the west coast of Newfoundland by British and Newfoundland interests, and guaranteed by the Governments of the Dominion and Great Britain, have been sold to the International Paper Co., of New York. This is the first large-scale invasion of the Newfoundland pulp and paper field by United States financial interests.

Oil of 42° Be. has been encountered in the Dalhousie well 5, located in Turner Valley, Alta. The company is a subsidiary of the Imperial Oil Co., Ltd. The flow is coming from a depth of 4525 feet, and at the rate of 400 barrels daily. It is a paraffin base oil.

The Regal Oil Refinery, Ltd., is erecting a refinery, with an initial capacity of 500 barrels crude oil, at Calgary, Alberta, which will be increased to 750 barrels.

The Guggenheim Distilleries of Canada, Ltd., has purchased the large beet sugar factory of the Dominion Sugar Co., at Kitchener, Ontario, and is converting it into a large modern distillery.

The Royal Crown Soap Co., Ltd., Vancouver, B.C., is erecting additions to its factory to increase output.

The Mexco Co., Ltd., Great Britain, has erected a factory at Swastika, Northern Ontario, for the manufacture of Klox explosives.

Courtaulds, Ltd., is making an addition to its viscose factory at Cornwall, Ontario. The addition will cost about \$250,000, and, when operating, necessitate the employment of 300 more employees.

The Canadian Goodrich Rubber & Tire Co., Kitchener, Ontario, will expend about \$150,000 in the erection of an additional building to its establishment. The company at present employs 900 people.

REPORT OF THE SECRETARY FOR MINES*

This report, which marks the completion of the sixth year of the Mines Department, contains, in addition to the report of the Chief Inspector of Mines, a review of general subjects arising out of the regulation and inspection of mine and quarry working, and also deals with the conduct and encouragement of research and inquiry, the testing and approval of safety lamps and explosives, and the testing of samples of mine air and dust, and other subjects.

In 1926 the output of saleable coal was 126½ million tons, or less than one half the annual rate of output during the years 1922—25. In the first four months of the year an average of 22 million tons a month was raised, this rate falling to very little in May, and reaching 2·2 million tons in September, subsequently rising to 5 million tons in October, to 8·75 million tons in November, and to 19·55 million tons in December. The number of wage-earners on colliery books was 1,111,900 at the beginning of April. Of 94,100 wage-earners at work at the end of July, two-thirds were safety men. At the end of the year there were 952,100 wage-earners once more in employment, and this number has continued to grow up to May, 1927. Comparison of accident figures with preceding years is not satisfactory on account of the general stoppage, but these figures in the first four months of 1926, when the pits were generally working normally, do not show any departure from the experience of recent years.

During the first four months of 1926, 17·5 million tons of coal was exported, compared with an average of 19·1 million tons during the corresponding periods of 1924 and 1925, and the total for the whole year amounted to 20·6 million tons. Owing to the coal stoppage on May 1, the export of coal and manufactured fuel was prohibited from that date, except under licence, and only about 5000 tons of coal per month was exported under these licences during the continuance of the coal dispute. Increasing quantities of coal were imported during the stoppage period, the amount during the year totalling 19,972,000 tons of coal and 1,069,000 tons of coke and manufactured fuel. Home consumption of coal in 1926 is not readily calculable, but from information available it is estimated that 128 to 133 million tons of coal were used for home consumption compared with 169 million tons during 1925.

The output of minerals in the United Kingdom is shown in the following table :

Kind of mineral	Quantity of mineral raised or quarried in	
	1926 Tons	1925 Tons
Coal	126,278,521	243,176,231
Iron ore and ironstone	497,123	951,873
West Coast hematite (non-phosphoric)		
Jura	976,562	2,284,186
Cleveland	2,161,290	6,464,081
Other sorts	122,461	343,021
Coal measures	33,960	90,717
Other occurrences		
Total Iron ore and ironstone	4,094,386	10,142,878

* Sixth annual report of the Secretary for Mines for the year ended December 31, 1926, and the annual report of H. M. Chief Inspector of Mines for the same period, with a statistical appendix to both reports. Mines Department. Pp. 179. H.M. Stationery Office, 1927. 8s. 6d.

Kind of mineral	Quantity of mineral raised or quarried in	
	1926 Tons	1925 Tons
All other minerals—		
(i) Non-ferrous ores :		
Tin ore, dressed (black tin)	3,878	4,032

‡ Revised figures for 1924 and 1925.

§ The heading "Limestone" in Section (i) includes limestone used for fluxing purposes and Dolomite used as a refractory.

Iron.—The output of pig-iron for the year was 2,458,200 tons, the lowest figure recorded since 1850. It compares with 6,261,700 tons in 1925, and 10,260,300 tons in 1913. Steel followed the same course, decreasing to 3,596,100 tons. In the first four months of the year, however, there was an increase of 250,000 tons of steel over the corresponding period of 1925. Imports of iron and steel in 1926 reached the unprecedented total of 3,740,279 tons, while the total exports, including re-exports, amounted to only 3,001,672 tons.

Tin.—The production of dressed tin ore ("black tin") in Great Britain (Cornwall and Devon) showed no great change during the year, the total amount being 3878 tons as compared with 4032 tons in 1925, 4858 tons in 1920, and 8355 tons in 1913.

Lead.—An increase of 22% is recorded in the production of dressed lead ore (80% metal) during 1926, the total figure being 19,076 tons compared with 15,578 tons in 1925, but it was only 79% of the 1913 production of 24,282 tons.

Zinc.—During the early part of 1926 consumption of

spelter was well maintained, but fell away later on account of the coal stoppage. The galvanisers and others in Great Britain absorbed 160,186 tons of spelter during the year. British production of dressed zinc ore (43% metal) was 1944 tons, an increase of 21% over 1925, but only 11% of the production for 1913 (17,294 tons). Production was confined to the North of England (50% of the total), Wales and the Isle of Man (38%), and Derbyshire (12%). Only four mines produced over 100 tons, namely, Great Laxey in the Isle of Man, Nentsbury and Threlkeld in Cumberland, and Mill Close in Derbyshire, the combined output of these mines amounting to 93% of the total.

Minerals used in the chemical and allied industries.

Production of most of these minerals decreased, compared with 1925 figures. The output of oil shale in 1926 was 1,959,795 tons, compared with 2,161,829 tons in 1925, and the number of persons employed in 1926 in the oil shale mining industry was 2966 compared with 1395 in 1925.

In the barytes industry British production for the most part remained confined to the medium and low-class grades used in the chemical industry and in manufactures where the "finest white" and the "finest ground" qualities are not essential. Continental producers retained the trade in the best qualities. Imports of ground barytes (including *blanc fixe*) were 38,414 tons, compared with 12,609 tons in 1925. The output of witherite in 1926 was 7538 tons (7780 tons in 1925) and of barytes the output in 1926 was 35,237 tons compared with 40,901 tons in 1925. The china clay industry of Devon and Cornwall suffered in common with other industries in which coal is an essential to manufacture. 1 ton of coal being required to dry and prepare for the market about 12 tons of china clay. Exports of this product were, however, well maintained, the total exports amounting to 651,990 tons (including a small amount of china stone) as against 652,576 tons for 1925. Salt exports in 1926, excluding table salt, amounted to 290,200 tons, compared with 313,203 tons in 1925 and 533,521 tons in 1913. Only about 30% of the salt exported goes to foreign countries, the bulk being sent to British India and other British Dominions. Gypsum production and the number of persons employed in the industry for the last five years has been one of progressive increase, the output in 1926 greater than that in 1922.

Minerals used in iron and steel-making and other smelting processes. The output of limestone and of dolomite for fluxing purposes and of gangster and silica rock reflected the depressed condition of the iron and steel industry, and were 57% and 32% respectively less than in 1925. Fireclay showed a reduction of 33%, moulding and pig bed sand one of 23%, and dolomite used as a refractory material one of 23%. The production of fluor spar was in 1926 35,883 tons, compared with 39,079 tons in 1925.

Minerals used in building and road-making, and for all other purposes. Of the 11 million tons of limestone for all purposes, 3,528,000 tons was used for lime and cement-making, 1,192,000 tons or 11% for fluxing in blast furnaces, and 4,530,000 tons or 41% for road-making.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is **2s. 6d. net and post free.**

Orders, accompanied by the appropriate remittance, should be sent to the **General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.**

DEATHS

Humphreys, Dr. Alexander C. (elected 1903), of the Stevens Institute of Technology, Hoboken, N.J., U.S.A., President. On August 14, 1927.

Hutchins, T. W. Stainer (elected 1923), of Hartford Lodge, near Northwich, Cheshire, Managing Director. On May 26, 1927.

Procter, Prof. H. R. (original member), of Polwim, Newlyn, Penzance, Emeritus Professor of Tanning. On August 17, 1927.

Smith, Dr. R. Greig (elected 1890), of 23, Itabaca Road, Elizabeth Bay, Sydney, N.S.W., Bacteriologist and Chemist. On August 6, 1927.

LONDON SECTION

The following provisional programme for the forthcoming 1927-28 session has been issued by the London Section:—On October 3, 1927, the Chairman's address will be delivered by W. J. A. Butterfield, M.A., F.I.C., who will speak on "The gas industry, past, present and future." The subject on November 7, 1927, will be "Recent advances in the hydrogenation of oils." The general introduction will be given by Mr. E. R. Bolton, F.I.C. Part I. (a) "Selective hydrogenation," (b) "Melting point of hydrogenated oils," by K. A. Williams, B.Sc., A.I.C. Part II. "Hydrogenation of fatty acids and neutral oils," by R. G. Pelly, F.I.C., and Part III. "The activity of a nickel catalyst," by E. J. Lush, M.A., A.I.C. On December 5, 1927, the paper will be "Automatic analysis of liquids and its application to control of water softening plants," by Dr. H. S. Hatfield.

On January 2, 1928, Prof. J. C. Drummond, F.I.C., will speak on "The future of biochemical research." On February 6, 1928, an address will be given by Francis H. Carr, C.B.E., the President of the Society. On March 5, 1928, a paper entitled "Syntheses under high pressure" will be presented by Prof. G. T. Morgan, F.R.S., R. Taylor, M.A., B.Sc., and T. J. Hedley, A.M.I.Chem.E., and on April 2, 1928, C. D. Adams, Assistant General Superintendent of the Anglo-Scottish Beet Sugar Corporation, Ltd., will speak on "The English sugar beet industry."

CALENDAR OF FORTHCOMING EVENTS

Sept. 23 to 26.—ASSOCIATION OF SPECIAL LIBRARIES AND INFORMATION BUREAUX. Fourth Conference, Trinity College, Cambridge. (*See CHEM. & IND., Sept. 16, p. 829.*)

Sept. 26 and 27.—CERAMIC SOCIETY. *Refractory Materials Section Meeting*, Town Hall, Bournemouth, commencing at

10 a.m. each day. The following papers will be read:—"A consideration of steel works refractories," by A. T. Green. "Note on silica bricks made without added bond," by W. J. Rees and W. Hugill. "Some experiments in the drying of clays," by R. S. Troop. "Crushing strength of unfired fire-clay bodies," by W. C. Hancock. "Determination of iron silicates," by A. E. J. Vickers. "Refractory material used as mortar for laying up refractories," by Prof. D. A. Moulton. "Characterisation of clay," by Dr. A. F. Joseph. Discussion to be opened by S. R. Hind. "Effects of temperature on the mechanical properties of silica products," by A. J. Dale.

Sept. 28.—FARADAY SOCIETY. *Ordinary Meeting.* Rooms of the Chemical Society, Burlington House, Piccadilly, W., at 8 p.m. (1) "The electronic theory of valency. Part VI. - The molecular structure of strong and weak electrolytes. (b) Reversible ionisation," by Prof. T. M. Lowry. (2) "The effect of temperature on diffusion potentials," by Dr. E. B. R. Pidgeaux. (3) "The ionisation of polyhydric acids," by C. Morton. (4) "The velocity of the decomposition of nitroacetic acid in aqueous solution," by K. J. Pedersen.

Oct. 3. SOCIETY OF CHEMICAL INDUSTRY. - *London Section.* "The gas industry, past, present and future," by W. J. A. Butterfield.

Oct. 5.—INSTITUTION OF SANITARY ENGINEERS. Opening Sessional Meeting.

Oct. 7. SOCIETY OF CHEMICAL INDUSTRY. *Manchester Section.* Chairman's Address, by C. J. T. Cronshaw.

Oct. 8. BIOCHEMICAL SOCIETY. Meeting at Cambridge.

Oct. 10.—INSTITUTE OF BREWING. *London Section.* Engineers' Club, Coventry Street, Piccadilly, W. Discussion on season's malts (made from 1926 barleys).

Oct. 11. INSTITUTION OF PETROLEUM TECHNOLOGISTS. General Meeting. House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m.

Oct. 12.—INSTITUTION OF THE RUBBER INDUSTRY. *London and District Section.* Engineers' Club, Coventry Street, W.1. "Coagulation, structure and plasticity of crude rubber," by Dr. O. de Vries.

Oct. 13.—INSTITUTION OF THE RUBBER INDUSTRY. *Birmingham and District Section.* Grand Hotel, Birmingham. Selling, by A. E. Hensworth.

Oct. 17.—INSTITUTION OF THE RUBBER INDUSTRY. *Sales Section.* Engineers' Club, Coventry Street, W.1. "What advertising-salesmanship can do for the rubber industry," by H. Hadley.

Oct. 19.—ROYAL MICROSCOPICAL SOCIETY. *Ordinary Meeting.* 20, Hanover Square, London, W.1, at 7.30 for 8 p.m.

Oct. 20.—CHEMICAL SOCIETY. *Ordinary Scientific Meeting.* Burlington House, Piccadilly, W.1, at 8 p.m.

Oct. 21.—INSTITUTION OF MECHANICAL ENGINEERS. *General Meeting.*

Oct. 27.—INSTITUTION OF MINING AND METALLURGY. *General Meeting.* Burlington House, Piccadilly, W.1, at 7.30 p.m.

Oct. 27.—INSTITUTE OF BREWING. *Midland Counties Section.* White Horse Hotel, Congreve Street, Birmingham. Brewer's microscope - a demonstration of its selection and use, with some hints on photomicrography," by H. Lloyd Hind.

Oct. 27.—INSTITUTION OF THE RUBBER INDUSTRY. *Manchester and District Section.* Geographical Society, St. Mary's Parsonage, Manchester. "Transmission and conveyor belting," by W. A. M. Keith.

INTERNATIONAL SOCIETY OF LEATHER TRADES' CHEMISTS

The London Conference of the International Society of Leather Trades' Chemists was held at the Leather-sellers' Hall, St. Helen's Place, London, on September 12, 13 and 14. The work of the Conference was carried on by a number of Scientific Commissions, which dealt with the problems associated with the analysis of tanning materials, analysis of leather, analysis of various tannery products, and matters affecting leather manufacturing. Reports of these discussions were subsequently presented to the main Conference.

The Conference elected Prof. Dr. V. Kubelka (President of the Czecho-Slovakian Section) as President for the next two years, and the next Conference will be held either in Prague or Basle. Apart from the matters of scientific detail discussed by the various technical commissions, the feature of the Conference was the decision that the new international method of tannin analysis shall become official at the same time that the I.V.L.I.C. (Internationale Verein Leder Industrie Chemiker) adopts this method officially. It may be noted that the American Leather Chemists' Association, in May last, approved the method provisionally, and it practically only remains for the German Association definitely to adopt it for the method to come into international use.

Delegates to the Conference attended from England, France, Italy, Spain, India, Belgium and Czecho-Slovakia.

On September 13, a dinner was given to the delegates by the members of the British Section under the Chairmanship of Dr. J. Gordon Parker (President of the British Section). There was a large attendance and many speeches.

"Our Rulers" was proposed by the Chairman and duly honoured, after which followed the toast of "Our Foreign Colleagues," proposed by Prof. D. McCandlish, the retiring President of the International Society of Leather Trades' Chemists, who spoke of the unselfish support that had been given to him during his term of office by the Foreign Sections and his foreign colleagues generally. Referring to the election of Dr. Kubelka as President for the next two years, he said this was evidence of the unselfishness pervading the Society, because if the other Sections had exercised their voting strength they could easily have ensured the election of a President from Great Britain or France. The toast was responded to by representatives from all the countries attending the Conference in cordial terms of appreciation for the hospitality extended to them by the London Section during the Conference.

The Chairman proposed the health of the President-elect, and referred to the excellent work which Dr. Kubelka has already done in the interests of the Society.

Dr. Kubelka briefly replied, and said that, although he felt quite unequal to the task that had been imposed upon him, he would do everything possible to forward the work of the Society. The Chairman assured Dr. Kubelka that he could rely upon every possible help from his colleagues in this work.

Dr. R. H. Pickard, F.R.S., proposing "The British Leather Trades," said the leather trades of the country since he had known them for the past seven years had had their ups and downs—perhaps he had better say their downs and ups, and that the ups were now coming along: at any rate he hoped so. All those present, he was sure, would join him in wishing the leather trades an improvement in their position because the leather trades' chemists, and if the employers were doing well then the chemists hoped to share in that prosperity. The leather trades' chemists had reason to be proud of their trade organisations and he particularly congratulated the United Tanners' Federation for their successful effort in bringing together the International Conference of Tanners, which was indirectly responsible, at a later date, for calling together that body which had promised to settle the hide tanning analysis question. He coupled with the toast the name of Sir Samuel Barrow, a member of the Court of the Leathersellers' Company, to whom, through Sir Samuel, he expressed the thanks of the International Society of Leather Trades' Chemists for many favours received during the Conference.

Sir Samuel Barrow, in replying to the toast, said he did not think the occasion ought to pass without mention of the late Prof. Procter, whose death was so regretted. Continuing, he said the Society had 890 members, representing 12 countries, excluding the United States and Germany, and that was an indication of the importance of the leather trade. Undoubtedly, the Society had done a great deal for the trade, especially in helping in that most difficult problem, the tanning of raw materials and turning them to the best account. The prosperity of the British leather trade depended upon the prosperity of international trade. Chemists were international in their efforts, and the British producer of leather should lose no time in producing leather not only for this country but for all the countries represented at the Conference. In that sense the prosperity of the British leather trade depended upon the prosperity of international trade and the interchange of our commodity not only with our Dominions but with foreign countries also. He congratulated the leather trade upon having chemists who were giving their time to the work of the trade as were the members of the Society.

The final toast of the evening was "The British Section" proposed in a very few words by Prof. L. Meunier (President of the French Section), in which he expressed thanks for the hospitality extended to the foreign delegates during the Conference. The chairman replied and said that the work of organising the Conference was carried out by a Committee consisting of himself and Mr. Lamb, and as Mr. Lamb never consulted him, the work had gone forward very smoothly. He added that it is the intention to found a memorial to the late Prof. Procter, and he was certain nothing would have pleased Prof. Procter more than to found a research scholarship at the Procter Research Laboratory in Leeds. It was to be hoped that it would be possible to work out the details of such a scheme, and to be able to say that this was done at the London Conference.

OBITUARY

F. M. MRAZSEK

Dr. F. M. Mrazsek, who died on June 29 last, was a native of Vienna, but for nearly fifty years he had resided in London in practice as a sugar expert.

He was born in 1849, and when a mere youth served as an officer of Hussars in the Austro-Prussian war. At the close of the war, he entered as a student in the University of Vienna, and finally proceeded to the Doctorate in Chemistry. For a time he was Assistant Chemist in the Imperial State University; but in 1878 he came to London as chemical expert to the firm of Czarnikow, the well-known sugar brokers, and from 1909 till the close of his life he maintained a practice at 106, Queen Victoria Street, by arrangement with Messrs. Reaks and Hughes, analysts and assayers, of that address.

Mrazsek became a member of the Society of Chemical Industry in 1905, but was an infrequent attendant at its meetings. During his long residence in this country, he took, indeed, but little part in scientific activities. This was, in part, due to his temperament, which was sensitive and retiring, and, in later years, to precarious health. It was doubtless also due to the circumstances that, although he was an accomplished laboratory worker, well read in the literature of his subject, his essential interests were artistic rather than scientific. He was, for instance, a highly accomplished musician. He had little ambition of a professional sort, and small prompting to write or publish.

As a man, he combined much personal dignity with a most attractive modesty of mind. He had great capacity for affectionate and loyal friendship, and by a small circle of intimate friends he will be greatly missed.

PERSONAL AND OTHER ITEMS

Mr. A. G. Lobley, M.Sc., who, as we have previously announced, had resigned from the readership in electro-chemistry in the University of Manchester, has become managing director to the Birmingham Electric Furnaces, Ltd.

Dr. F. H. McDowall, M.Sc., who has been engaged in research work in the chemical laboratories of University College, London, has been appointed Dairy Research Chemist at the New Zealand Massey Memorial Agricultural College.

Mr. G. St. J. Perrott will succeed Dr. A. C. Fieldner as superintendent of the Pittsburgh Experiment Station, the largest of the eleven experiment stations of the U.S. Bureau of Mines.

Mr. F. A. Ernst, acting chief of the Fertiliser and Nitrogen Fixation Investigations of the U.S. Bureau of Chemistry, has joined the engineering staff of the Atmospheric Nitrogen Corporation, which is planning the erection of a large synthetic ammonia plant at Hopewell, Va.

Mr. M. L. Davies, who has come to England for the marriage of his daughter with the son of Sir Max Muspratt, is the president of the Standard Chemical Co., Toronto, and a director of various other chemical concerns. A

Liverpool man by birth, and a technical chemist by training, Mr. Davies was articled to the old firm of James Muspratt & Sons, and in 1890 became manager of the firm's Liverpool works, which was taken over by the United Alkali Co. in 1891; three years later he

Mr. M. L. Davies

was made manager of the Hutchison Works of the United Alkali Co. In 1899 he went to America as the general manager of the North American Chemical Co., and in 1913 he moved to Toronto to join the Standard Chemical Co., successively becoming vice-president in 1913 and president in 1924.

Honorary Degree for Sir Charles Parsons

In presenting The Hon. Sir Charles Algernon Parsons, O.M., K.C.B., F.R.S., to the Chancellor of the University of Leeds for the honorary degree of LL.D., Prof. J. W. Cobb said: "To bring the methods and results of scientific investigation into the service of the community through industrial application is one of the chief ends which this University has set before it, and no name could represent with greater distinction the attainment of that ambition in full measure than that of Sir Charles Parsons. He has been fortunate in seeing one child of his brain reach full and imposing stature in his own time, as he has watched the steam turbine take unquestioned first place among the prime movers known to engineering science, serving to open up the way to a much more general and efficient utilisation of mechanical and electrical power. Grasp of scientific principles and insight into their consequences, along with a rare capacity for right choice in experiment and design, have been the mark of this and other achievements of his genius, and they have been combined with a breadth of outlook which has increased their value and widened the sphere of his usefulness. His active interest in the British Association has displayed itself in many ways, including generous financial support, and he has filled the presidential chair. Other societies have benefited by his

guidance in the same high office, and he has controlled large industrial enterprises, including one for optical work which links to Lord Rosse and continues a family tradition. University education in Newcastle has found in him a warm supporter. In the spirit of adventure, he has summoned the forces of crystallisation to the making of diamonds, and contemplated breaking the earth's crust for the harnessing of the vagrant energies of the underworld. Recognition has been forthcoming of his many scientific and public services in the Honorary Fellowship of his College at Cambridge, the Fellowship of the Royal Society, the Knight Commandership of the Bath, and in the membership of the Order of Merit, into which distinguished company he enters as the first engineer. It was to Leeds that he came for works training in early years, to Yorkshire for his wife. To Leeds again we welcome him, and do him what honour we may."

Corrosion of Copper Pipes

The cause of the failure, by local corrosion, of tin-lined copper water pipes is explained by Messrs. A. F. Dufton and F. L. Brady in a note recently published in *Nature*. The potential difference between copper and tin is about + 0.4 volt, but when the tin becomes tarnished the potential difference in water is - 0.1 volt. Accordingly, if the coating develops defects it becomes actually pernicious.

Scottish Shale-Oil Industry

It is officially announced that the Broxburn (Linlithgowshire) Refinery & Crude Oil Works is to be permanently closed down, thus making the fourth shale-oil works to be closed down within the last two years. The works employed 1000 men.

Sesamum Crop of British India, 1927-28

From information based on reports received from provinces and states which comprise about 79% of the total sesamum acreage in India, the total area, so far reported, comes to 2,203,000 acres, as compared with 1,976,000 acres at this time last year, or 11% increase. Weather at sowing time was favourable, and the condition of the crop at present is, on the whole, fair.

New Use for *o*-Dichlorobenzene

Work of the U.S. Bureau of Chemistry (Colour Laboratory) has shown that commercial *o*-dichlorobenzene, which dissolves the oxides of aluminum, copper, nickel and silver, but does not attack the metals themselves, makes a very good cleanser for metals.

U.S. Bureau of Chemistry and Soils

Dr. H. G. Knight, dean of the College of Agriculture of the University of W. Virginia, has been appointed chief of the new U.S. Bureau of Chemistry and Soils, which combines the work of the old Bureau of Chemistry, the Bureau of Soils, and the Fixed Nitrogen Research Laboratory. Each group retains its identity, but works in close co-operation with the others. Dr. F. G. Cottrell, chief of the Fixed Nitrogen Research Laboratory, retains his post, as does Dr. C. A. Browne, chief of the old Bureau of Chemistry, whilst Dr. A. G. McCall has been appointed head of the Soils work.

The I.-G. Synthetic Fuel

We learn that the application of the I.-G. for reduced rail rates on "synthetic petrol" has been granted by

the German railway authorities (cf. CHEM. AND IND., Sept. 16, p. 833). Request for reduced rail rates was made, it is stated, because the higher rail tariff made it impossible to sell the "synthetic petrol" at a profit in Germany. *The Times* reports that the "synthetic petrol," also known as "Lenna petrol," will probably be placed on the market early next year.

Nitrogen Fixation in Japan

According to the U.S. Department of Commerce the Japanese Government has been unable, for fiscal reasons, to utilise the patents for nitrogen fixation acquired by it from Germany under the Reparations Scheme, and has, therefore, decided to allow these patents to be used by private companies on condition that the operating plants be completed within the next ten years. Last year the Oriental Nitrogen Association was formed comprising the Mitsui, Mitsubishi, Sumitomo, Furukawa and Sankyo interests, which received the patents. The Fertilizer Investigation Commission claims, however, that the association has not fulfilled its agreement in that it has made no preparation to utilise the patents, but is instead attempting to control the import of nitrogenous fertilisers from Germany, thereby defeating the primary object of the Government, which is to provide cheap fertilisers for Japanese agriculture.

At the time when the Oriental Nitrogen Association (apparently also known as the "Oriental Nitrogenous Fertiliser Co.") was formed, it was reported that the company was to use a synthetic ammonia process due to the Japanese Nitrogen Laboratory.

Nitrogen fixation in Japan really began in 1909 when the Nippon Chisso Hiryo K. K. began to make calcium nitrate. During the war, the company expanded greatly, increasing its capital to 22 million yen. Subsequently, rights to the Casale process were obtained, and three Casale plants were erected, with an annual capacity of 80,000 tons ammonium sulphate. Two plants are now being enlarged to give a capacity of 100,000 tons, and the total output will eventually be raised to 300,000 tons to eliminate imports. Another company has a total capacity (rarely attained) of 84,000 tons of ammonium sulphate, whilst the Kagoshima Electric Co. is developing a process. The total output of nitrogenous fertiliser made by nitrogen fixation in 1926 is estimated at 150,000 tons, against 129,043 tons in 1925 and 102,544 tons. The contribution from the coke and gas industries amounts to about 100,000 tons of ammonium sulphate yearly.

The Japanese output of ammonia amounts to, roughly, 400,000 lb. a year. The two plants responsible for this production are being enlarged, however, and the capacity, it is estimated, will shortly reach 1,000,000 lb. annually. Some 96,000 lb. of anhydrous ammonia was imported in 1925, but it is considered that domestic producers will shortly be able to fill all requirements. Ammonia is used in Japan mainly as a refrigerant, a use which is steadily increasing.

Synthetic Methanol in Japan

It is reported that the Japanese Nitrogen Laboratory (controlled by the Minister of Commerce and Industry) has developed a new process for the synthesis of methanol

from carbon and hydrogen at high temperatures and pressures. Working rights have been conceded to the Mitsui Bussan Kaisha, the Japan Oil Co., and the Japan Acetic Acid Co.

Synthetic Ammonia in Norway

The Norsk Hydro-Elektrisk Kvaestof A. is to build a new synthetic ammonia plant at Notodden, and will use a process stated to resemble that of Haber. This company formerly made ammonium nitrate at Notodden, but suspended manufacture some years ago. Production is expected to begin in 1928.

Beet Sugar in Poland

Although the area of sugar beet plantations in 1926 reached 184,000 hectares, compared with an average of 172,991 hectares for the last three years before the war, the output in white sugar will probably reach only 490,000 tons, against 521,206 tons in 1925, when only 173,000 hectares were under sugar beet, owing to heavy rain. The average percentage of sugar contained in the beet amounted in October to 17.63, against 17.38 during the same period of 1925.

Russian Chemical Syndicate

A Russian Chemical Syndicate is to be formed with a capital of 11,500,000 roubles to organise the sale of chemicals and prevent harmful competition between the different Russian chemical trusts.

Iodine Production in Russia

Iodine is now being recovered from the waste waters from boreholes at Baku at a cost of 60 to 70 roubles per kg., and developments are contemplated which would bring the price down to 20-22 roubles. It is estimated that some 400 tons of iodine are lost annually in the Baku basin.

Chilean Copper Industry in 1926

The decrease in exports of copper ores from Chile may be accounted for by the partial exhaustion of many small mines in the district of Atacama, which are worked by local companies using antiquated methods. Exports of refined copper from Chuquibambilla, where the plant of an American company is in operation, fell off 4600 tons from the 1925 figure, owing chiefly to world market conditions. The capacity of this plant is larger than the 1926 production of 96,614 tons, and with the installation of new crushing mills, an increase of 35% in production will be possible, and the company hopes to reach the 150,000-ton mark by the end of 1927. The average content of ore handled is below 2%, and the whole plant is situated over 100 miles inland in the midst of a desert, at an altitude of 9500 ft. above sea-level. Construction work at the other mine at Potrerillos is about completed, and the rate of production is estimated at 118 tons of blister copper, about 95% pure, per day. During 1926 the United States was again the largest consumer of Chilean refined copper, taking 59,561 tons out of the 96,614 tons produced in the district. Germany was the second largest consumer. In this district all the known high-grade deposits are nearly exhausted, and the low-grade ores remaining must be worked by concerns having large capital resources to provide the machinery necessary for profitable returns.

REVIEWS

VAN NOSTRAND'S CHEMICAL ANNUAL. A handbook of useful data for analytical, manufacturing, and investigating chemists, chemical engineers, and students. Edited by Dr. J. C. Olsen, assisted by Dr. T. R. Le Compté. Pp. xv + 882. Sixth issue, 1926. Thoroughly revised and enlarged. London: Chapman & Hall, Ltd., 1927. Price 21s.

This is a most valuable collection of what the title page calls "Useful data" for chemists. It consists almost entirely of tables of numerical data. These have been, wherever possible, compiled from the original sources, and as far as I have been able to test them, the work shows a very high degree of accuracy. A mere enumeration of the tables (there are 230 of them, besides matter of another kind) would occupy more space than is allotted to this review; but they cover data of almost every kind that the analyst or the technical chemist can need. The arrangement of the tables in the book is not severely logical or consecutive, but this defect, if defect it be, is compensated for by an excellent and full index. There is a very full and useful table of gravimetric factors and their logarithms, in which figures are given for each relationship in both directions, for example, BaSO_4 to S and S to BaSO_4 . There are tables of properties of long lists of elements and their inorganic (about 4800) and organic (about 5200) compounds, specific gravity tables, ionisation tables, vapour pressures, heats of formation and combustion, constants of oils, fats, waxes, gums, etc.; and there is a general discussion at the end of the book of certain questions—weight and mass, specific gravity, thermometers, gas volume calculations, etc., with a number of illustrative "problems."

Misprints are few, and Americanisms are few. One must regret that in a book of this standing *data* should be regarded as a singular noun; and one may reasonably cavil at the term "coefficient of expansion at constant volume," and the use, in a scientific book, of the word "heavy" for "dense." But these are slight blemishes. Errors in the text that I have noticed are the misspelling of "phosphorus" on p. 94, the need to lift the formula CO_2 by a line on p. 733, the accidental writing of millimeter instead of milliliter on p. 767, the use of p twice in treating the pycnometer on p. 772—the second p is probably meant to be p' —and the spelling of Nicholson with a k on p. 773. Paragraph (9) on p. 772 is only true if the "body" there spoken of has no coefficient of expansion, and the statement on p. 781 that 1 c.c. of uranium has a volume of 0.0535 c.c. is obviously wrong: the typography needs altering and the words "1 gram" need to be inserted before "has a volume."

The only other regret I would express, and it implies no reproach to the book, is that it should be necessary, in a book like this, to devote about 50 pages to tables which have no *raison d'être* except the perversity of the world in refusing to adopt universally the metric system and to use direct-reading hydrometers.

The book is well and clearly printed on good paper, well bound, with the corners of the pages rounded, and is very easy of reference. It can be unhesitatingly recommended to all chemists.

J. T. DUNN

Gmelin's Handbuch der Anorganischen Chemie. Eighth completely new and revised edition. Published by the Deutsche Chemischen Gesellschaft. Edited by R. J. Meyer and collaborators. System-Nummer, 20. Lithium. Pp. xxiv + 254. Berlin: Verlag Chemie G.m.b.H., 1927. Price 37.50 m. (Subscription price, 28.50 m.)

The section on lithium in the seventh edition contained 43 pages, whereas the present volume contains 254. This enormous expansion is partly due to the large amount of work on lithium published during the past 20 years, and partly to a fuller and more comprehensive treatment of the subject.

Every paper dealing with lithium, either directly or indirectly, seems to have been discovered by the compilers of the work, who have been careful to extract, either fully or in abstract, important numerical data on solubilities and other physical properties, a number of solubility and other diagrams being also reproduced.

The work should be invaluable to all who are particularly interested in lithium compounds, but essentially as a work of reference. It contains only a few pages, and those mostly near the beginning, which could be read with any degree of pleasure, but this is inevitable in a work of this character. It is essentially a dictionary, and an uncritical one. Its arrangement is satisfactory, it is well produced, and not so condensed or full of abbreviations as to be unintelligible. H. BASSETT

L'Alcool d'Industrie. By A. RICHARD. Les Automobiles sans Pétrole. Encyclopédie Leauté (2nd series). Pp. xi + 222. Paris: Gauthier Villars & Cie, 1927. Price 18 fr.

This book may be recommended with confidence to those seeking for information relating to the alcohol industry, and particularly to the position of that industry in France. In a small space many useful data are given, and in many cases full details concerning processes for the production of ethyl alcohol by chemical and biological means from sugar-containing substances such as beetroot, from cereals, and from cellulosic materials such as waste wood for use in internal-combustion engines. Account is taken of all by-products and suggestions made for their possible use. The difficulties connected with each method are pointed out, and the author states his opinion as to its commercial prospects. Reference is made in each instance to any research which has been carried out. The most recent development in the alcohol industry, namely the commercial production of absolute alcohol, is studied in detail. This is an important contribution, owing to the fact that absolute alcohol is miscible in all proportions with petrol.

The value of this book would have been greatly enhanced by the addition of an index. If space did not permit of this, a list of the processes mentioned in alphabetical order would have helped to supply the want. Such a deficiency in any scientific work is bound to limit the sphere of its usefulness.

The author is to be congratulated on his easy style of French, for which his English readers will be duly grateful.

E. C. CHOLMELEY

COMPANY NEWS

BURT, BOULTON & HAYWOOD, LTD.

A final dividend of 5% has been declared on the ordinary shares, making, with the interim of 5% already paid, 10% for the year, being the same as for the previous year. We regret that the declaration of dividend was announced in last week's CHEMISTRY AND INDUSTRY in a form which gave a misleading impression.

BRITISH GLUES AND CHEMICALS, LTD.

The seventh ordinary general meeting was held on September 11. Mr. T. Walton, chairman, presiding. After briefly reviewing the accounts (cf. CHEM. AND IND. Sept. 9, p. 816), the chairman stated that the losses in connexion with the coal strike had been aggravated by heavy falls in the selling prices of fats and greases, but minimised by the reduced cost of raw material. The prices of fertilisers were slightly lower: glue prices were a little higher, but were still at an unsatisfactory level. The question of heavy transport charges had been considered, and in this connexion the company had purchased the Newport factory in July, 1926, and also the Bermondsey factory of Messrs. B. Young and Co., Ltd., the latter bringing a valuable hide glue connexion. The company intended to remodel the Bermondsey factory so as to deal with some portion at least of the London raw material on the most efficient lines in the London area. This would result in considerable economy in transport charges. In the near future a scheme would be put forward for reduction of capital. Reference was made to the retirement of Mr. William Cotes from the Board.

BRITISH INSULATED CABLES, LTD.

On September 15 a board meeting was held at which Mr. Dane Sinclair was elected chairman of the company in place of the late Mr. James Taylor, J.P. (in addition to being managing director). Mr. Sinclair has been associated with the company for a long period, having been elected general manager in 1902 of the British Insulated and Helsby Cables. An interim dividend has been announced of 1s. per share, less tax, on the ordinary shares, being the same as last year's interim.

SWEDISH MATCH CO., LTD.

A new company called "The Great Amalgamated Match Co." has been formed in Japan with a share capital of 6,000,000 yen (about £600,000), to take over all the factories belonging to the Tokio Match Co., the biggest company in Japan and the chief competitor of the Swedish company there. The Nippon Match Co. and the Koyekisha Match Co., both owned by the Swedish company, will also be taken over. The Amalgamated Co. will control between 60% and 70% of the Japanese match production.

MALEHURST BARYTES CO., LTD.

The Malehurst Barytes Company has taken over the management of the old-established business of the Devonshire Baryta Co., Ltd., of Exeter and Bridford. It is proposed to re-equip the mine and develop its resources. The continued supply of the grades of barytes for which this company has been well known for the past 50 years will thus be assured and improved grades of Devonshire barytes will be placed on the market at an early date.

HARBEN'S (VISCOSE SILK MANUFACTURERS), LTD.

Trading profit for the year ended April 30, 1927, amounted to £9774, after transferring expenditure of £37,571 to experimental and development account. Debenture interest from January 1 to April 30 absorbed £2627, leaving £7147, which is carried forward. Trading commenced on the basis of a normal production about the end of 1926, so that the profit of £7147 was made over a period of about four months, during which time part of the labour employed was not fully trained. Rather more than 9 tons of artificial silk yarn is being manufactured every week, and practically the whole of the output has been sold for the remainder of this year, and large contracts have been taken for next year. Additional plant and machinery to increase the output to 18 tons per week is in course of delivery.

ROSARIO NITRATE CO., LTD.

The thirty-eighth annual general meeting, held on June 24, was presided over by the chairman, the Rt. Hon. Lord Cullen of Ashbourne, K.B.E., who referred to the death of Mr. H. W. Sillem. For reasons of economy it was not proposed to fill his place on the Board at present. After meeting interest and other charges and deducting £21,692 for amortisation and depreciation, £28,982 for repairs and renewals, and £22,183 for closing down and stoppage expenses, there was a loss of £50,534 for 1926, against a net profit of £37,592 for 1925. Deducting the credit balance of £30,458 brought forward, a debit balance of £20,076 remained to be carried forward. During the year, £29,000 had been spent on repairs and renewals to the Rosario maquina, and an expenditure of £22,000 had been entailed partly by the enforced restriction of production under the producers' agreement, which terminated on June 30. The ultimate effect of the breakdown of this agreement would be to the advantage of the industry. With the removal of the fixed selling price, Chilean nitrate would be able to contend with its competitors for a larger share of the world's consumption, but only at prices which would leave a narrow margin of profit to the cheapest producers and would prevent many of the less-favoured Chilean oficinas from producing at all. Faced with these facts, the Board decided to reopen on July 1 the Rosario oficina, which had been closed throughout the year. The Chilean Government had decided not to reduce the export duty at any rate before July 1, 1928. The company had spared neither effort nor expense to cheapen their cost of production in bringing both their oficinas into the highest state of efficiency. Operations by the Guggenheim process had now been commenced on a large scale, but the actual costs of this process had still to be proved.

DOMINION TAR AND CHEMICAL CO., LTD.

After placing £35,000 to depreciation and writing off the balance of the underwriting commission by transferring £7500 to ordinary share premium account and £500 to profit and loss account, the net profit was £86,640 (£49,698 for 1925). A final dividend has been proposed on the ordinary shares (excluding the new issue) of 6½%, less tax, making 12% subject to British tax less Dominion relief, and a bonus of 2½%, and after transferring £20,000 to general reserve, £9140 will be carried forward.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.b. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—3.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9—£9 5s. per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£8—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals, 8d.—8½d. per lb. Crude 60's, 2s. 6d.—2s. 7d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 4d.—2s. 5d. per gal. Pale, 95%, 2s. 2d.—2s. 3d. per gal. Dark, 90%, 1s. 9d.—1s. 10d.; 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9¾d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 9d. per gal. Pure, 1s. 6d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8½d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 8½d.—9½d. per gal. Solvent 95/160, 1s. 4d.—1s. 5d. per gal. Solvent 90/190, 8½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £11 10s.—£12 per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—87s. 6d.—95s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.
o-Cresol 29/31° C.—5½d. per lb.
m-Cresol 98/100%.—2s. 7½d. per lb.
p-Cresol 32/34° C.—2s. 8½d. per lb.
Dichloraniline.—2s. 3d. per lb.
Dimethylaniline.—1s. 11d. per lb.
Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
Dinitrochlorbenzene.—£84 per ton d/d.
Dinitrotoluene.—48.50° C. 8d. per lb., naked at works.
Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
Diphenylamine.—2s. 10d. per lb. d/d.
 α -Naphthol.—2s. per lb. d/d.
 β -Naphthol.—11d.—1s. per lb. d/d.
 α -Naphthylamine.—1s. 3d. per lb.
 β -Naphthylamine.—3s. per lb.
p-Nitraniline.—1s. 8d. per lb.
m-Nitraniline.—3s. per lb. d/d.
o-Nitraniline.—5s. 9d. per lb.
Nitrobenzene.—6d. per lb., naked at works.
Nitronaphthalene.—1s. 3d. per lb.
R. Salt.—2s. 2d. per lb.
Sodium Naphthionate.—1s. 8½d. per lb. 100% d/d.
o-Toluidine.—7½d. per lb.
p-Toluidine.—2s. 2d. per lb., ex works, naked.
m-Xylidine Acetate.—2s. 6d. per lb. 100%.
N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.
Acid, Boric B.P.—Cryst. 10s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
Acid, Camphoric.—19s.—21s. per lb.
Acid, Citric.—1s. 7d.—1s. 8d. per lb. Less 5%.
Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 3½d. per lb. Technical 11½d.—1s. per lb. Good demand.
Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
Amidol.—9s. per lb. d/d.
Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.
Amidopyrin.—8s. 6d. per lb.
Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5 cwt. casks. Resublimed.—1s. per lb.
Atropine Sulphate.—11s. per oz. for English make.
Barbitone.—6s. per lb.
Benzonaphthol.—3s. 3d. per lb.
Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
Bromides.—Ammonium.—2s. 2d.—2s. 3d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot.

Calcium Lactate.—1s. 2d.—1s. 3½d. per lb.
Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
Chloral Hydrate.—3s. 6d. per lb., duty paid.
Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
Cresote Carbonate.—6s. per lb.
Ethers: Prices for Winchester quarts; dozen Winchester quarts; carboys or drums; and 10 cwt. lots respectively; 730—1s. 2½d.; 1s. 2d.; 1s. 1½d.; 1s. 0½d.; 720 tech.—1s. 5½d.; 1s. 5d.; 1s. 4½d.; 1s. 3½d.; 720 pur. (Aether P B 1914)—2s. 4d.; 2s. 3½d.; 2s. 3d.; 2s. 2d.
Formaldehyde.—£39 per ton. Ex wharf in barrels.
Guaiacol Carbonate.—5s. per lb.
Hexamine.—2s. 4d.—2s. 6d. per lb.
Homatropine Hydrobromide.—30s. per oz.
Hydrastine Hydrochlor.—English make offered, 120s. per oz.
Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols. 2s. 3d. per gal. In carboys; Winchesters, 2s. 11d.—3s. 9d. per gal.; 20 vols., 4s. 3d. per gal.; Winchesters, 5s.—6s. 6d. per gal. Special prices for larger quantities.
Hydroquinone.—2s. 11d. per lb.
Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
Iron Perchloride.—19s.—22s. per cwt., according to quantity.
Magnesium Carbonate.—Light Commercial £31 per ton net.
Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
Menthol.—A.B.R. recryst., B.P., 17s. 9d. per lb. not. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 10d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
Methyl Salicylate.—1s. 9d. per lb.
Methyl Sulphonol.—9s. 6d.—9s. 9d. per lb.
Metol.—11s. per lb. British make.
Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
Paraldehyde.—1s. 4d. per lb.
Phenacetin.—2s. 9d.—3s. per lb.
Phenazone.—4s. 3d.—4s. 6d. per lb.
Phenolphthalein.—6s.—6s. 3d. per lb.
Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.
Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
Potass. Permanganate.—6d. per lb. spot.
Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
Resorcin.—3s. 9d.—4s. per lb. spot.
Saccharin.—55s. per lb., and lower in quantity.
Salol.—2s. 4d. per lb.
Sod. Benzoate, B.P.—1s. 10d.—2s. 2d. per lb.
Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—18s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.-95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 8d.—1s. 9d. per lb. (Crystal, 1s. 8½d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.)

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonol.—6s. 6d.—6s. 9d. per lb.

Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (*ex Anethole*).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. **Amyl Butyrate.**—5s. 3d. per lb. **Amyl Salicylate.**—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. **Benzyl Alcohol** free from Chlorine.—2s. per lb.

Benzaldehyde free from Chlorine.—2s. 6d. per lb. **Benzyl Benzoate.**—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 3d. per lb.

Coumarin.—9s. 9d. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. per lb. **Geraniol** (Palmarosa).—18s. 6d. per lb. **Geraniol.**—6s. 6d.—10s. per lb. **Heliotropine.**—4s. 9d. per lb. **Iso Eugenol.**—13s. 6d. per lb. **Linalol.**—(ex *Bons de Rose*) 15s. per lb.—(ex *Shui Oil*) 10s. 6d. per lb.

Linalyl Acetate. (ex *Bois de Rose*) 18s. 6d. per lb.—(ex *Shui Oil*) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodmol.—32s. 6d. per lb. **Safrol.**—1s. 6d. per lb. **Terpincol.**—1s. 8d. per lb. **Vanillin.**—17s. 9d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. **Anise.**—3s. per lb. **Bergamot.**—28s. per lb. **Bourbon Geranium.**—14s. 6d. per lb.

Cumpher.—75s. per cwt. **Cananga, Java,** 26s. per lb. **Caesin, 80/85%.**—7s. 6d. per lb. **Cinnamon, Leaf.**—6d. per oz. **Citronella.**—Java, 1s. 10d. per lb., c.i.f. U.K. port. For shipment over 1928, 1s. 6d. prompt shipment from Java. **Ceylon, Pure,** 1s. 8d. per lb.

Clove, pure.—5s. 6d. per lb.

Eucalyptus.—2s. 3d. per lb. **Lavender.**—Mont Blanc 38/40%, 18s. 9d. per lb. **Lemon.**—8s. per lb. **Lemon-grass.**—4s. 6d. per lb. **Orange, Sweet.**—11s. 3d. per lb.

Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. **Palma Rosa.**—10s. 6d. per lb. **Peppermint.**—Wayne County, 16s. 9d. per lb. **Japanese,** 8s. 3d. per lb.

Petitgrain.—7s. 9d. per lb. **Sandalwood.**—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Nov. 15th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Sept. 29th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Akt. Svenska Maskinverken, and Eriksson. Evaporating apparatus. 23,364. Sept. 6.

Banz. Apparatus for heating fluids. 23,462. Sept. 6. (Holland, 22.6.27.)

British Rotary Filter Co., Ltd., and Joyce. Filters. 23,598. Sept. 8.

Donthitt. Desiccation of substances. 23,621. Sept. 8. Etabl. F. Labesse. Brickwork exposed to high temperatures. 23,836. Sept. 10. (Fr., 10.2.27.)

Gensbaur. Rotary tube kilns. 23,609. Sept. 8. (Czechoslovakia, 20.6.27.)

Hills. Drying-machines etc. 23,490. Sept. 7.

Internat. Cement Gun Co. Delivering and drying granular substances. 23,661. Sept. 8. (Ger., 14.9.26.)

Johnson (I.-G. Farbenind.). Manufacture of aqueous solutions of solvents etc. 23,400. Sept. 6. Measuring intensity of radiation of sources of ultra-violet light. 23,631. Sept. 8.

King, Tandevim, & Gregson, Ltd. Furnaces. 23,545. Sept. 7.

Lloyd. Apparatus for mixing liquids. 23,481. Sept. 7.

Lurgi-Ges. für Wärmetechnik. Utilising and producing adsorption media. 23,802. Sept. 9. (Ger., 11.11.26.)

MacCallum. Grinding, mixing, etc. mills. 23,269-72 and 23,274-5. Sept. 5.

MacCallum and Smith. Grinding-mills. 23,542. Sept. 7.

Musgrave & Co., Ltd., and Shillington. Apparatus for separating solids from gases. 23,642. Sept. 8.

Nelson. Furnaces. 23,545. Sept. 7.

Parker, Winder, & Church, Ltd., and Smith. Mixing-machines. 23,484. Sept. 7.

Prodorite, Ltd., and Fender. Acid-proof vessels. 23,287. Sept. 5.

Wilson. Instrument for detection of mineral deposits. 23,708. Sept. 9.

I. Complete Specifications

13,644-5 (1926). Whatmough. Dispersion of solids in liquids. (276,728.)

18,762 (1926). Lambert, and Lambert Heater & Engineering Co., Ltd. Heating of liquids. (276,807.)

20,514 (1926). Smith (Chattfield). Filtering-machines. (276,820.)

20,883 (1926). Rennerfelt. See XI.

9890 (1927). I.-G. Farbenind. Transforming substances into small pieces for reaction with gases. (269,209.)

*11,518-9 (1927). Jung. Blowing molten substances in the form of spray. (276,955-6.)

*22,333 (1927). Soc. Ital. Pirelli. Degassing liquids. (276,987.)

*23,189 (1927). Siemens & Halske A.-G. Determining a constituent in a mixture of gases. (277,025.)

II.—Applications

Arnold (Standard Development Co.). Distilling hydrocarbons. 23,624. Sept. 8.

Avenarius. Motor fuel. 23,381. Sept. 6. (Ger., 7.9.26.)

Bloxam (Allgem. Ges. für Chem. Ind.). Manufacture of petroleum hydrocarbons. 23,770. Sept. 9.

Coley. Extraction of oil from shale. 23,517. Sept. 7.

Denby. Washing-apparatus for coal etc. 23,485. Sept. 7.

Gill (Gasoline Products Co.). Conversion of hydrocarbons. 23,319. Sept. 5.

Internat. Combustion Engineering Corp. 23,417. See III.

Johnson (I.-G. Farbenind.). Recovery of oils of high b.p. 23,256. Sept. 5. Purification of gases. 23,257. Sept. 5.

Manufacture of products from montan wax. 23,258. Sept. 5.

Drying, carbonisation, etc. of coals. 23,259. Sept. 5. Separation of olefines etc. 23,628. Sept. 8. Production of butadiene hydrocarbons. 23,629-30 and 28,843. Sept. 8 and 10. Production of high viscosity oils. 23,632. Sept. 8.

Kirschner. Production of mixtures of mineral oil products and aliphatic alcohols. 23,715. Sept. 9. (Ger., 9.9.26.)

Masters and Masters. Vertical slot ovens etc. 23,242. Sept. 5. Regenerator gas-retort settings. 23,747. Sept. 9.

Munn. Composition fuel. 23,404 and 23,769. Sept. 6 and 9. National Processes, Ltd., and Lambert. Manufacture of catalysts for oxidation of gases. 23,386. Sept. 6.

Technical Research Works, Ltd., and Lush. 23,316. See XX. Urbana Coke Corp. Treating solid fuel. 23,680. Sept. 8. (U.S., 21,926.)

Wade (Standard Oil Co.) Coking hydrocarbon oils. 23,743. Sept. 9.

Zacon. Manufacture of hydrocarbons. 23,555. Sept. 7.

II.—Complete Specifications

5911 (1926). Penniman. Motor fuels. (257,886.)

6337 (1926). Niel en and Luing. Distillation of carbonaceous materials. (276,107.)

13,402 (1926). Lessing. Cleaning of carbonaceous materials. (276,723.)

14,080 (1926). Petroleum Chemical Corp. Composite motor spirit. (253,131.)

14,200 (1926). Humphreys & Glasgow, Ltd., and Stelfox. Manufacture of water-gas. (276,753.)

19,536 (1926). Red River Refining Co., Inc. Mineral oil distillation. (257,250.)

6818 (1927). Seelig. Process and apparatus for cracking oils. (269,499.)

21,203 (1927). Florentin, Kling, and Matignon. Obtaining light hydrocarbons from animal or vegetable oils. (276,007.)

*617 (1927). Kay. Apparatus for cracking oils. (276,947.)

*22,983 (1927). Wolinski. Treatment of coal. (277,011.)

III.—Application

Internat. Combustion Engineering Corp. Di-tillation of tar, oil, etc. 23,117. Sept. 6. (U.S., 21,926.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Introducing sulphocyanide groups into organic compounds. 23,308. Sept. 5.

I. G. Farbenind. Manufacture of benzantrones etc. 23,529. Sept. 7. (Ger., 10,926.) Manufacture of anthraquinone derivatives. 23,771. Sept. 9. (Ger., 9,12,26.)

Imperial Chemical Industries, Ltd., Pope, and Wyler. Dyes etc. 23,658. Sept. 8.

Johnson (I.-G. Farbenind.). Manufacture of vat dyestuffs. 23,253. Sept. 5. Manufacture of dibenzanthrone. 23,399. Sept. 6. Production of aromatic amines. 23,841. Sept. 10.

IV.—Complete Specifications

11,551 (1926). Newport Co. Preparing 2 (or 3)-chloroquinizarine. (260,544.)

13,782 (1926). Bucherer. Manufacturing dyes. (252,745.)

15,515 (1926). British Dyestuffs Corp., Baddiley, Shepherdson, and Thornley. Manufacture of benzantrone derivatives. (276,766.)

15,516 (1926). British Dyestuffs Corp., Ltd., and Thornley. Black and grey vat dyestuffs. (276,767.)

15,609 (1926). British Dyestuffs Corp., Ltd., Baddiley, Shepherdson, and Thornley. Manufacture of vat dyes. (276,768.)

V.—Applications

Bleachers' Assoc., Ltd., Barrett, Gaunt, and Kershaw. 23,495-6. See VI.

Bonwill. Artificial textile products from viscose etc. 23,535-7. Sept. 7. (Holland, 11,2,27, 24,2,27, and 7,4,27.)

Carpmael and Carpmael (I.-G. Farbenind.). Manufacture of artificial silk. 23,457. Sept. 6.

Imray (I.-G. Farbenind.). Manufacture of acetyl-cellulose. 23,304. Sept. 5.

Johnson (I.-G. Farbenind.) 23,625. See VI.

Law. Treatment of bast plants etc. 23,589. Sept. 8.

Nederlandsche Kunstzijdefabr. Preparing artificial products from acetyl cellulose etc. 23,350. Sept. 6.

Holland, 11,2,27, 24,2,27, and 7,4,27.

V.—Complete Specifications

14,270 (1926). British Dyestuffs Corp., Ltd., Baddiley, Chorley, and Butler. See VI.

1792 (1927). Potts (Arnold Print Works). See VI.

8029 (1927). Rinman. Producing cellulose and paper from straw, esparto, etc. (269,154.)

18,167 (1927). Duhamel, and Comp. Gén. des Ind. Textiles. Cleaning wool. (274,100.)

VI.—Applications

Bleachers' Assoc., Ltd., Barrett, Gaunt, and Kershaw. Treatment of textiles. 23,495-6. Sept. 7.

Carpmael (I.-G. Farbenind.). Dyeing artificial silk. 23,458. Sept. 6.

Johnson (I.-G. Farbenind.). 23,524. See XII. Production of dyeings on cellulose esters. 23,625. Sept. 8. Manufacture of wetting-agents etc. 23,626. Sept. 8. Washing, dyeing, etc. textiles. 23,842. Sept. 10.

VI.—Complete Specifications

14,270 (1926). British Dyestuffs Corp., Ltd., Baddiley, Chorley, and Butler. Dyeing artificial silk. (276,757.)

1792 (1927). Potts (Arnold Print Works). Treatment of cellulosic materials. (276,877.)

6128 (1927). Charles. Apparatus for dyeing felt or other hats. (276,893.)

VII.—Applications

Carpmael (I. G. Farbenind.). Manufacture of aqueous solutions of carbon disulphide. 23,454. Sept. 6. Manufacture of alkali cyanides. 23,459. Sept. 6.

Carpmael, Carpmael, and Carpmael (I.-G. Farbenind.). Manufacture of new quaternary ammonium compounds. 23,549. Sept. 7.

Casman. Precipitating copper from its solutions. 23,622. Sept. 8.

Geere. Control of production of carbon dioxide. 23,749. Sept. 9.

Gelsenkirchener Bergwerks- A.-G., Dittmann, and Faerber. Production of manganese peroxide etc. 23,881. Sept. 10.

Johnson (I. G. Farbenind.) Production of nickel and cobalt carbonyl. 23,255. Sept. 5. Production of metal carbonyls. 23,260. Sept. 5. Treatment of materials with alkaline liquids. 23,398. Sept. 6.

Jungmann and Kolbert. Manufacture of solid alcoholic solution of free iodine. 23,552. Sept. 7. (Ger., 21,926.)

Klingspor. Liming process, and preparation of lime therefor. 23,746. Sept. 9.

National Processes, Ltd., and Lambert. 23,386. See II. Prodorite, Ltd., and Fender. 23,287. See I.

Robson. Preparation of sulphuric acid etc. 23,391. Sept. 6.

Siemens & Halske A.-G. Production of ozone. 23,650. Sept. 8. (Ger., 14,926.)

VII.—Complete Specifications

5908-10 (1926). Penniman. See XX.

869 (1927). Schendbauer & Giessing A.-G. See VIII.

7072 (1927). Krebs. Apparatus for electrolysing solutions of alkali chlorides. (267,560.)

8943 (1927). Metallbank u. Metallurgische Ges. A.-G. Treating lithium-containing silicates by means of neutral alkali salts. (269,878.)

*19,393 (1927). Rosenheim. Process for the production of base-exchanging substances. (276,967.)

*21,044 (1927). Büsching. Denitration of waste acid mixtures. (276,972.)

VIII.—Applications

Beton-Bohr u. Pressges. Manufacture of flower pots etc. 23,528. Sept. 7. (Ger., 10,12,26.)

VIII.—Complete Specifications

809 (1927). Scheidhauer & Giessing A.-G. Producing refractory, acidproof, and other products. (264,192.)

8454 (1927). Hartford-Empire Co. Producing a fired ceramic block. (276,903.)

*22,873 (1927). Barton. See X.

IX.—Applications

Etabl. F. Labesse. 23,836. See I.

Foulger, Fox, Stockell, and Fox, Stockell, & Co. Concrete blocks for paving etc. 23,762. Sept. 9.

Gensbaur. Manufacture of cement etc. 23,656. Sept. 8. (Austria, 20.7.27.)

Hubacek, Kneil, and Sticha. Manufacture of marble substitutes. 23,326. Sept. 5.

Kopelaviciene and Kopelavicius. Building materials. 23,470. Sept. 6.

X.—Applications

Ashcroft. Metallurgy of ores etc. 23,633. Sept. 8.

Gasman. 23,622. See VII.

Coley. Reduction of ores. 23,229-30. Sept. 5. Manufacture of zinc. 23,811. Sept. 10. Manufacture of tin. 23,812. Sept. 10.

Deutsche Gold- u. Silber-Scheideanstalt vorm. Roessler. Hardening iron etc. 23,282. Sept. 5. (Ger., 6.9.26.)

Elektronmetall Ges., and Wagner. Die-casting plant for magnesium etc. 23,520. Sept. 7.

Etchells. Case-hardening of alloy steels. 23,877. Sept. 10.

Hay. Ferrous alloys. 23,314. Sept. 5.

Hornsey. Reducing metal oxides. 23,311. Sept. 5. (U.S., 8.9.26.)

Johnson (I.-G. Farbenind.). Metallic ores for electro-magnets etc. 23,252. Sept. 5.

X.—Complete Specifications

11,265 (1926). Dunlop Rubber Co., Ltd., Lakeman, and Maccabe. Protection of metal surfaces. (276,705.)

14,005 (1926). Sulman and Picard. Treatment of tin ores. (276,743.)

109 (1927). Kamishima. Non-magnetic alloy of high resistance. (276,874.)

9514 (1927). Deutsche Versuchsanstalt für Luftfahrt. Manufacture of chemically-pure aluminium. (276,911.)

11,650 (1927). Eaton. See XI.

*22,788 (1927). Krupp Grusonwerk A.-G. Extraction of precious metals from ores, residues, and metallurgical products. (277,001.)

*22,873 (1927). Barton. Abrasive surfaces, and metals and alloys for their manufacture. (277,004.)

*23,035 (1927). Joseph. See XI.

*23,282 (1927). Deutsche Gold- u. Silber Scheideanstalt vorm. Roessler. Hardening iron and steel. (277,030.)

XI.—Applications

Ever Ready Co. (Great Britain), Ltd., and Koningsock. Electric batteries. 23,678. Sept. 8.

Johnson (I.-G. Farbenind.). 23,252. See X. 23,631. See I.

Marks (Batterien- u. Elemente-Fabr. System Zeiler A.-G.). High-tension etc. batteries. 22,533. Sept. 7.

Meyer and Spanner. Gas-filled discharge device. 23,804. Sept. 9. (Ger., 9.9.26.)

Müller. Ethylchloride tubes. 23,797. Sept. 9. (Ger., 28.6.27.)

Northrup. Electric furnaces. 23,672. Sept. 8.

Oldham & Son, Ltd., and Clarke. Galvanic batteries. 23,559. Sept. 7.

Siemens & Halske A.-G. 23,650. See VII. Induction furnaces. 23,647. Sept. 8. (Ger., 11.9.26.) High-frequency induction furnaces etc. 23,784. Sept. 9. (Ger., 11.9.26.)

XI.—Complete Specifications

20,883 (1926). Rennerfelt. Electric furnaces. (276,823.)

109 (1927). Kamishima. See X.

11,650 (1927). Eaton. Chromium-plating machines. (276,921.)

*22,330 (1927). Soc. Ital. Pirelli. Impregnating insulating materials. (276,985.)

*22,629 (1927). Gen. Electric Co., Ltd. Incandescence lamps. (276,992.)

*23,035 (1927). Joseph. Protection of the lead sheathing of cables. (277,017.)

XII.—Application

Johnson (I.-G. Farbenind.). Bleaching artificial fatty acids. 23,524. Sept. 7.

XIII.—Applications

British Thomson-Houston Co., Ltd., and Warren. Lacquers etc. 23,249. Sept. 5.

Imray (I.-G. Farbenind.). Manufacture of condensation products of the naphthostyryl series. 23,416. Sept. 6.

Johnson (I.-G. Farbenind.). Production of lacquer coatings. 23,254. Sept. 5. Manufacture of lacquers, films, etc. 23,397. Sept. 6.

MacCallum. Production of paints, pastes, etc. 23,276. Sept. 5.

XIV.—Applications

Goodyear Tire & Rubber Co. 23,440. See XX.

I.-G. Farbenind. Manufacture of coloured rubber goods. 23,305. Sept. 5. (Ger., 4.9.26.)

XIV.—Complete Specifications

11,265 (1926). Dunlop Rubber Co., Ltd., Lakeman, and Maccabe. See X.

*19,839 (1927). Du Pont de Nemours & Co. Age-resisting rubber compositions. (276,968.)

*23,305 (1927). I.-G. Farbenind. Manufacture of coloured rubber. (277,034.)

XV.—Applications

Klingspor. 23,746. See VII.

Maschinenfabr. Turner A.-G. Treating hides, skins, etc. 23,616. Sept. 8. (Ger., 11.9.26.)

XV.—Complete Specifications

9633 (1927). Röhm & Haas A.-G. Tanning with metallic salts and salts of silicic acid. (270,267.)

XVI.—Application

Martin. Fertiliser. 23,718. Sept. 9.

XVII.—Application

Gardner (Schneider et Cie. and Akc. Spolecnost drive Skodov Závody v. Plzni). Crystallisation mixer for treating masscinites in sugar works etc. 23,681. Sept. 8.

XIX.—Applications

Bell and Bilton. Manufacture of animal foods. 23,494. Sept. 7.

Brown. Preserving fish. 23,780. Sept. 9.

Carpmael (I.-G. Farbenind.). Protecting corn in storage from vermin. 23,455. Sept. 6.

Salerni. Manufacture of chocolate articles etc. 23,317. Sept. 5.

XIX.—Complete Specification

26,862 (1926). McKinlay. Manufacture of chocolate etc. (276,860.)

XX.—Applications

Carpmael (I.-G. Farbenind.). 23,308. See IV. Manufacture of acetic anhydride. 23,456. Sept. 6. Manufacture of basic oxime ethers etc. 23,787. Sept. 9.

Goodyear Tire and Rubber Co. Preparing dithiazyl disulphide. 23,440. Sept. 6. (U.S., 7.9.26.)

I.-G. Farbenind. Supports for sheets of material soluble in organic solvents. 23,641. Sept. 8. (Ger., 16.10.26.)

Johnson (I.-G. Farbenind.). 23,400. See I. 23,628-30. See II. 23,841. See IV. 28,843. See II.

Jungmann and Kolbert. 23,552. See VII.

Kirschner. 23,715. See II.

Müller. 23,797. See XI.

Technical Research Works, Ltd., and Lush. Apparatus for hydrogenation of organic compounds etc. 23,316. Sept. 5.

XX.—Complete Specifications

5908-10 (1926). Penniman. Oxidised products, cesses of making same, and apparatus therefor. (252,255,920, 256,922.)

15,641 (1926). Cassella & Co. Ge. Manufacture of solutions containing organic phosphorus and complex old compounds. (253,916.)

*22,706 (1927). Chem. Fabr. auf Actien (vorm. E. Schering). Preparation of active germinal gland substances in a water soluble form. (276,994.)

*22,870 (1927). Soc. Chem. Ind., in Basle. Use of medicaments insoluble or sparingly soluble in water. (277,003.)

XXI.—Applications

Dufay. Colour photography etc. 23,557. Sept. 7. Hamburger. Photographic films etc. 23,872. Sept. 10.

Mills. Production of cinematographic colour pictures. 23,396. Sept. 6.

Sokal (Kalle & Co.). Apparatus for photographic development. 23,324. Sept. 5.

XXII.—Complete Specifications

11,717 (1926). Scott and Mexico, Ltd. Explosives. (276,715.)

*21,044 (1927). Busehning. *See* VII.

XXIII.—Application

Pattison. Apparatus for purifying etc. fluids in boilers etc. 23,660. Sept. 8.

XXIII.—Complete Specifications

16,625 (1927). Warburg. Artificially preparing natural mineral waters. (274,834.)

*19,393 (1927). Rosenbaum. *See* VII.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Development and Intelligence, 35, Old Queen Street, London, S.W.1 has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number.

Argentina: Leather belting (232). *Australia*: Steel buckets for dredge (A.X.5193). *Brazil*: Drugs, perfumes (233). *British India*: Paper, stationery (211). *Canada*: Raw materials for the rubber, paint and kindred industries (216). Paint, paper, varnish (217). *Chile*: Steel rails (A.X.5194). Corrugated iron sheets, concrete (A.X.5198). *Colombia*: Mining and road-making plant, steel ropes (236). *Czechoslovakia*: Brass tubes, aluminium, raw copper (222). *France*: Raw and finished metal products (221). *Hungary*: Mica, mica-nite, synthetic resin, varnished cloth, ebomite (227). *South Africa*: Leather (218).

Information on Nickel

A Bureau of Information on Nickel has recently been established in Leadenhall Avenue, London, with the object of collecting and correlating technical and other information relating to the uses of nickel and nickel alloys, and to place such knowledge freely at the disposal of British industry.

Gasworks Plant

The Kidderminster Gas Co. has placed an order with the Woodhall Duckham Vertical Retort and Oven Construction Company (1920), Ltd., for an installation of continuously working vertical retorts, consisting of ten 62-in. retorts, capable of carbonising 56 tons of coal per 24 hrs. The setting will be arranged in a

steel-framed brick-panelled retort house, and is to be complete with coal handling plant, coke screening and storage plant, and waste heat boiler.

EDITORIAL

The Photosynthesis of Natural Products

DOES the old controversy about the origin of living matter still linger, one wonders? One can remember cogent arguments from the vitalists, fortified by explanations based on a mysterious vital principle, and one can remember equally hard facts brought forward by those who preferred to seek facts. Both sides would argue and afterwards would retain equally their previous convictions, but we never cared very much about the final opinion so long as the actual investigation went on. One of those who has steadfastly laboured to extend our knowledge of the chemistry of the plant organism is Prof. Baly, who, as a valued clerical correspondent once remarked, has made "... a syrup which may be sugar" from carbonic acid and water with the help of the energy in sunlight. This work of Prof. Baly is familiar to all who are interested in the growth of plants, and we recently reread with considerable pleasure the rejoinder to our clerical friend in which Prof. Baly described his investigations in a charming article, published in this JOURNAL in 1923. This important work on photosynthesis was subjected to a certain amount of criticism, but Prof. Baly and his colleagues have not been dismayed, and have now collected further evidence, which is given in three papers, published in the September issue of the Proceedings of the Royal Society. The greatest precautions were taken to ensure the purity of the materials used, and results were obtained which indicate that the direct photosynthesis of complex carbohydrates in a single operation has been achieved in the laboratory. Apparently ordinary formaldehyde is not present when an aqueous solution of carbon dioxide is exposed to ultra-violet light, but an organic compound, probably a complex aldehyde, is present. Further, when carbonic acid, adsorbed on nickel or cobalt carbonate suspended in water, is exposed to visible light, organic products, of which at least one is a carbohydrate, are photosynthesised. From the negative results obtained in over 200 central experiments it is concluded that it would seem impossible that the photosynthesised carbohydrates arise from organic impurity. Finally, the authors find there is a marked similarity between photosynthesis *in vivo* and that now achieved *in vitro*. We must defer further consideration of this fascinating work and its far-reaching implications; but we are glad to note that the authors' experimental

work was made possible by the generous grants which Messrs. Brunner, Mond & Co. have made from time to time to the Liverpool University Chemical Laboratories.

The Paint Research Association

The British Paint, Colour and Varnish Manufacturers have opened the laboratories of their Research Association at Teddington and marked the occasion in the accustomed way, lunching and drinking each other's health and making speeches. An account of the ceremony appears in this issue. The Research Association has made a good beginning, its opening ceremony was attended by a number of guests, including three Presidents or ex-Presidents of the Society of Chemical Industry, all of whom spoke, and spoke well. It was fortunate or wise - the words are nearly synonymous -- to secure the attendance of Dr. Weidlein, the director of the Mellon Institute of Industrial Research, who encouraged the Association by stating the benefits derived, in the United States, from prolonged and careful study. The Association was wise in choosing as its President Mr. S. K. Thornley, and as its Vice-Presidents Dr. H. H. Morgan and Mr. C. F. Hare. These three are all well-known in the paint and colour industry. They have breadth of vision, public spirit, and sound common sense, and they realise, and have for years past realised, the important part which science should play in this branch of industry. In making the choice of these three leaders the Association showed wisdom; the Association was perhaps fortunate in choosing Dr. L. A. Jordan as director of research, for Dr. Jordan was not well-known in the industry, and it was to a certain extent due to chance that he was available for the post. Dr. Jordan has qualities which, we judge, mark him out as specially suited for research of the kind necessary to this great industry. We hope before the end of the year to visit the laboratory quietly and deliberately, and are confident that when we do so we shall find much to interest ourselves and our readers. The paint and varnish industry has changed greatly during the last twenty or five-and-twenty years, and the change is still going on. New pigments and new solvents are rapidly taking the place of the old ones; thousands of motor-cars are sold every week enamelled with materials unknown at the beginning of the century; we see no reason why other new materials should not be found useful in painting

houses, ships and bridges. The main function of paint is to protect against corrosion, its secondary function is to adorn the protected structure. There are already plenty of pigments which are suited for adornment; new pigments and new solvents to last for six years instead of four will be very valuable; it should not pass the wit of the chemist to find materials that will last eight years or even more and can still be applied in thin layers on wood and iron. We have in our cabinet fossils from the carboniferous limestone showing a portion of the original coloured pattern of the shell; there's a pigment for you!

Chemical Nomenclature

A flattering correspondent wrote to us the other day suggesting that we should adopt the word *hiocon* as a contraction for that frequent phrase hydrogen ion concentration. We are greatly pleased and honoured, but nevertheless feel that CHEMISTRY AND INDUSTRY must, in matters of chemical nomenclature, follow the fashion of the respectable chemists rather than lead it. We remain, however, of opinion that the advantages claimed for "hydrogen ion concentration" over "acidity" are over-rated. The word "ion" itself is now used in so vague a sense as to convey several meanings, intelligible to those who are familiar with the subject, but not to others. There are many other words in common daily use which have the same defect. If a chemist tells you that somebody's speech or hat is simply priceless, you can, if you heard the speech or saw the hat, agree with him, and even add that it is frightfully topping, and each of you knows what the other means. Ion means in the Greek, going or moving, and it has long been used for a moving, electrically charged, elementary particle, with a separate existence of its own, darting about in a fluid medium in a vigorous and independent way. It is also used to mean an elementary particle firmly fixed in a crystal, held there tightly by a number of adjacent particles, and having its electrical charge completely neutralised by the electrical charges of the adjacent particles. In fact, nearly every substance which is not composed of an aggregate of separate molecules is now spoken of as built up of ions. When you come to such a word as ionisation, unless you are trained to know what the speaker means by his use of the word, you are equally in the dark. There are some well-known writers of text-books who tell you that when sulphuric acid is mixed with water, the sulphuric acid splits up into two ions, and that these dart about in the way denoted by the original Greek word: this is one use of the word ionisation. Other chemists take a different view of the situation, and if they use, as they do, the word ionisation in this case, they mean that the molecule of sulphuric acid combines with several molecules of water to make a new chemical compound, which is a hydrate of sulphuric acid, and that this hydrate can itself effect a loose chemical composition with more water, until a mass is formed, mainly consisting of water, some of which is firmly attached to the sulphuric acid and some very loosely. Some chemists regard the glue, or threads, holding the mass together to be the oxygen particles: we hardly know whether to call them atoms or ions—others think the oxygen and the hydrogen each

act in this way and they call the hydrogen bivalent, though we think they do not really mean that it has twice the combining power or electrical attraction of the univalent elements. Finally, this hydrate of sulphuric acid conglomerate becomes so large and its parts become so diffused that the threads become weak and the whole thing becomes unstable in the sense that it may readily split up into two parts each of which is liable to make a weak and temporary union with other portions or molecules or aggregates of hydrate or water. This is what they mean by ionisation; other chemists call this dissociation; we have only to remember that the cohesion of the crowd is less than the cohesion of the football team, and we see how both phrases fit in. We imagine that one unit of oxygen may be strong enough to hold together a whole molecule of sulphuric acid and in addition a considerable quantity of water, but if you go on long enough adding to the two sides connected by the original unit and you also weaken the oxygen unit by hanging water on to it a time will come when the strength of the oxygen unit gives way and the whole dropsical body either parts or else becomes so loose that for electrolytic purposes it acts as if it were in two parts. Until chemists are more unanimous in their views, we must continue to use the word ion, with all its ambiguities. The modern chemist, as we have mentioned on earlier occasions, is compelled to make use of terms and diagrams which were formerly exact and free from ambiguity. Some of these are no longer capable of this high praise. The part that water plays in making hydrates is poorly explained in our ordinary small text-books; one is even sometimes hastily tempted to imagine, only for a moment, that the author himself is not very clear about the chemical activity of water and the nature of the compounds or mixtures so formed. Reasons could be furnished for arguing that some of the crystalline hydrates are not compounds but mixtures whose definite chemical composition is due to the fact that they have a definite shape which permits a definite proportion only of the constituents of the mixture. In a very few cases we think water may even be driven off from the crystal and re-absorbed by it without any visible change in the shape of the crystal. No doubt some chemists can tell us which of these solid hydrates are chemical compounds and which are not: it is not a matter we have ever studied ourselves. So, too, we trust, some chemists can tell us which of the liquid hydrates are chemical compounds and which are not. Perhaps a rigid definition of the phrase chemical compound is a desirable preliminary. Until we get to that stage we propose to adopt ionisation and hydrogen ion concentration as part of the current speech of chemists, remembering that the ion is either moving rapidly or sitting down, is either separate or combined with other ions or with atoms, molecules or aggregates; it may display intense electrical activity or its electricity may be so quenched and subdued by the electricity of those who hold its hand that it cannot be detected; if we remember also that ionic means un-molecular we shall have so clear an idea of this valuable conception that we may use the word ion and its derivatives in our editorial paragraphs without transgressing the conventions.

RESEARCHES ON MENTHONES, MENTHOLS AND MENTHYLAMINES*

By PROF. JOHN READ, M.A., Ph.D.

Introductory

The earlier investigatory work in the menthone series was based mainly upon *l*-menthol, $C_{10}H_{20}O$, one of the main components of peppermint oil. Although peppermint appears to have been cultivated in Japan for more than two thousand years, the first recorded allusion to crystalline menthol, or "mint camphor," was made by the Dutch botanist, Gambius, in 1771.

Menthones.—In 1881, Moriya, working in the University of Tokyo under the supervision of Prof. Atkinson, prepared an optically inactive oil, $C_{10}H_{18}O$, by heating *l*-menthol from Japanese peppermint oil with chromic acid in a sealed tube at 120° . "In a note appended to the paper, Prof. Atkinson suggests that menthol is a secondary alcohol derived from a saturated closed chain hydrocarbon formed by the addition of six atoms of hydrogen to ordinary *cymene*, and that the oxidation product, $C_{10}H_{18}O$, obtained by Mr. Moriya, is the corresponding ketone." This is the first reference in the literature to menthone (*Journ. Chem. Soc.*, 1881, 39, 77). Moriya also stated that "it is not improbable that this substance, which holds the menthol [of peppermint oil] in solution, is the same body as that formed by the action of the chromic acid liquid upon the camphor." However, Andres and Andreef were the first to isolate menthone from peppermint oil (*Ber.*, 1892, 25, 617). Meanwhile, Beckmann had shown that *l*-menthol when carefully oxidised with warm chromic acid mixture yielded *l*-menthone; the product was found later to be substantially identical with the ketone of peppermint oil. Slight variations were noticed in the specific rotatory powers of different preparations, the maximum value of $[\alpha]_D$ being -28.46° ; moreover, *l*-menthone was found to be "inverted" by the action of certain acid or alkaline reagents, and even when heated alone. Cold strong sulphuric acid gave rise to the most pronounced "inversion," a ketone having a maximum value of $[\alpha]_D +28.14^{\circ}$ being produced by treating *l*-menthone with this reagent (*Annalen*, 1889, 250, 335). That this dextro-rotatory ketone is not the enantiomorphous form of *l*-menthone, as was sometimes assumed, is shown by Beckmann's observation that it yields a liquid oxime, the properties of which are quite distinct from those of an optical antipode of the well-defined crystalline oxime of *l*-menthone (m.p. 58°).

The accepted constitutional formula (I) for menthone, which was proposed by Semmler in 1892, affords an interpretation of the "inversion" through the assumed occurrence of a reversible keto-enol change. Carbon atom (1) retains its asymmetry throughout this process, while the asymmetry of carbon atom (4) is temporarily suppressed in the enol-form. The ultimate return to the keto-form, consequent upon the removal of the enolising influence, thus results in the production of a mixture of *l*-menthone and *d*-isomenthone, the relative proportions of these stereoisomerides varying in accordance

with the prevailing conditions. Menthone and *iso*-menthone, which are readily interconvertible through the common enol-form, are therefore to be regarded as *trans*- and *cis*-forms of *p*-menthan-3-one:—

The *cis*-configuration (III) has usually been adopted for menthone; since, however, the recent observations of Zeitschel and Schmidt (*Ber.*, 1926, 59, 2298) indicate that the density and refractive index of *l*-menthone are somewhat lower than the corresponding constants of *d*-isomenthone, it appears in the light of the Auwers-Skita rule that menthone should be assigned the *trans*-configuration (II). In agreement with this conclusion, measurements of the parachors made by Carter (*Journ. Chem. Soc.*, 1927, 1278) gave slightly higher values for *d*- and *dl*-isomenthone than for *l*- and *dl*-menthone; but further evidence is needed before a decisive solution of this interesting configurational problem can be reached. As indicated below, *d*-menthone and *dl*-menthone also have been rendered available through the researches of Pickard and Littlebury, and by alternative methods in the new work now under review; menthone is therefore known in all three of the stereoisomeric forms corresponding to one of the above configurations.

Menthols.—Each of the three stereoisomeric forms of both the ketonic configurations corresponds theoretically to two secondary alcohols: consequently, there should be two externally compensated and four optically active menthols together with a like number of isomenthols. The six members derived from menthones (as distinct from isomenthones) were all isolated and characterised by Pickard and Littlebury (*Journ. Chem. Soc.*, 1912, 101, 124) during an investigation of the products obtained in the catalytic hydrogenation of thymol. By an ingenious application of phthalic anhydride to this complicated mixture of substances it was found possible to prepare *dl*-menthol (m.p. 34°) and *dl*-neomenthol (m.p. 51°), and to resolve each of them into *d*- and *l*-forms. All these menthols oxidise to menthones, from which they are configurationally derived.

Conflicting views have arisen concerning the spatial disposition of the groups ($-H$ and $-OH$) about the additional asymmetric carbon atom (3) of the menthols and neomenthols. Vavon and Coudere (*Comptes rendus*, 1924, 179, 405) consider the hydroxyl group (3) of neomenthol to occupy the *trans*-position with respect to the hydrogen atom (4), since *d*-neomenthol esterifies more easily than *l*-menthol. A *cis*-configurative arrangement of these groups is denoted, however, by the readiness with which *d*-neomenthol is dehydrated to form *d*- Δ^3 -menthene when treated with formic acid, phosphorus pentachloride, or thionyl chloride (Zeitschel and Schmidt, *loc. cit.*).

* Paper read before Section B of the British Association for the Advancement of Science, on September 6, 1927, during the meeting at Leeds.

Menthylamines.—Andres and Andreef (*loc. cit.*) prepared *l*-menthylamine by reducing *l*-menthoneoxime, and a similar method was used by Wallach (*Annalen*, 1893, 276, 296). In addition, Wallach found that when *l*-menthone was heated with ammonium formate it gave not only *l*-menthylamine, but also a so-called "R-menthylamine," which, although dextro-rotatory, was not enantiomorphous with *l*-menthylamine. Subsequently (*Annalen*, 1898, 300–378) Wallach showed that while *l*-menthylamine reacts with nitrous acid to yield ordinary *l*-menthol, the stereoisomeric "R-menthylamine" gives partly racemised *d*- Δ^3 -menthene in this reaction; he concluded, therefore, that the groups NH_2 (3) and H (4) are in the *trans*- and *cis* configurative positions, respectively, in the molecules of *l*-menthylamine and "R-menthylamine." Whether the new base was to be regarded as a menthylamine or as an isomenthylamine remained undecided. Finally, in 1913 (*Lundén*, 397, 218), Wallach described a base, named "i-menthylamine," obtained by reducing *dl*-menthoneoxime; recent work indicates that this base was a mixture, owing possibly to the occurrence of "inversion" during the oximation of the optically inactive ketone (*Journ. Chem. Soc.*, 1926, 2225).

isoMenthone and its derivatives. Prior to the inception of the work outlined below, very little reliable information had been gathered for the isomenthone series, although the literature contained sporadic and conflicting statements concerning supposed members of this group. The most important observation was that of Beckmann (*Ber.*, 1909, 42, 846), who gave brief particulars of a supposed *d*-isomenthylamine hydrochloride, having $[\alpha]_D^{25} + 17.7^\circ$ in dilute aqueous solution; this was prepared by reducing the crude liquid oxime furnished by "inverted" *l*-menthone. When treated with nitrous acid it yielded a dextro-rotatory isomenthol, which upon oxidation gave a ketone having $[\alpha]_D^{25} + 93.2^\circ$; this was regarded as *d*-isomenthone.

Summing up the earlier researches, it is apparent that in the menthone series the chemistry of the menthylamines required considerable amplification; while in the isomenthone series practically the whole field awaited exploration. The fundamental importance to the terpene chemistry of accomplishing a complete survey of the stereoisomeric menthones, isomenthones, and their derivatives was emphasised many years ago by Semmler ("Die ätherischen Öle," 1906, III, 333; compare also Meyer u. Jacobson, "Lehrbuch der organischen Chemie," 1923, II, i, 891); but further progress on the lines hitherto adopted was beset with difficulties. With the exception of Pickard and Littlebury's investigations, departing from thymol, most of the work summarised above had been based upon *l*-menthol, which, as already stated, first attracted attention as a crystalline principle in 1771. It is necessary to go back to the same period in introducing a new substance, the study of which has done much to complete our knowledge of the field of organic chemistry under discussion.

Recent investigations

In 1788, soon after Governor Phillip's arrival in New South Wales, a species of eucalypt growing plentifully

around Port Jackson attracted attention on account of the peppermint odour of its leaves. The first eucalyptus oil to be distilled was obtained from its foliage and used as a substitute for peppermint oil by Dr. White, Surgeon-General to the First Settlement (White, "Journal of a Voyage to New South Wales," 1790, 227). The species is now known as *Eucalyptus piperita*, or the Sydney Peppermint. As shown by H. G. Smith in 1900, the peppermint odour of its essential oil is due to a ketone, $\text{C}_{10}\text{H}_{16}\text{O}$, which he named piperitone (*J. Proc. Roy. Soc. N.S. Wales*, 1900, 34, 316). This ketone, which is laevo-rotatory, has since been found in twenty-three species of eucalyptus, growing for the most part in the south-eastern regions of Australia, and characterised by a butterfly-wing leaf-venation. The maximum content is reached in the oil of the Broad-leaved Peppermint (*B. dives*), which furnishes nearly 50% of *l*-piperitone. In 1921, a detailed study of this ketone, which was diagnosed as Δ^4 -menthen-3-one (IV), already synthesised in the *dl*-form by Wallach (*Annalen*, 1908, 362, 272), was begun by Read and Smith and continued in collaboration with Bentivoglio, Hughesdon, and Earl (*Journ. Chem. Soc.*, 1921, 119, 779; 1922, 121, 575, 582, 1863; 1923, 123, 2267, 2916; 1924, 125, 129; 1926, 2072; this J., 1923, 42, 339 r). In the course of these investigations, *d*-piperitone was discovered by Simonsen (*Journ. Chem. Soc.*, 1921, 119, 1644) in the essential oil of a Himalayan grass, *Andropogon Swarancusa*; since the optically active ketone racemises easily, presumably as a result of enolisation, (when heated to 200° or dissolved in alkaline reagents (*Journ. Chem. Soc.*, 1923, 123, 2269), it is readily available in *l*-, *d*-, and *dl*-forms.

Menthones and isoMenthones.—When catalytically hydrogenated in the presence of colloidal palladium, according to Paal's method, *l*- or *d*-piperitone absorb one molecular proportion of hydrogen, with the formation of ketonic products possessing enhanced but reversed optical rotations, and consisting mainly of *d*- or *l*-isomenthone, respectively (Table A). Since *dl*-piperitone behaves in a similar way, these reactions provide new sources of *d*-, *l*-, and *dl*-isomenthone, and hence also of *l*-, *d*-, and *dl*-menthone.

TABLE A

Unsaturated ketone	$[\alpha]_D^{25}$ of unsaturated ketone	$[\alpha]_D^{25}$ of derived isomenthone
<i>d</i> -Piperitone	+ 62.50°	— 71.41°
<i>l</i> -Piperitone	— 51.90°	+ 69.10°
<i>d</i> -Pulegone	+ 23.00°	+ 33.45°
<i>l</i> - Δ^4 -p-Menthen-3-one	— 78.36°	— 43.24°

A later series of investigations by Read, Robertson, and Cook (*Journ. Chem. Soc.*, 1925, 127, 2782; 1926, 2209, 2223; 1927, 1276) have utilised these new points of departure in extending our knowledge of the chemical and stereochemical relationships of the menthones, the isomenthones, and their more important derivatives. In the hydrogenation of piperitone (IV) at the ordinary temperature by Paal's method, the spatial additive process is conditioned by the asymmetry of carbon atom (4), and the optical rotation of the product corresponds to a mixture of 82% of *d*-isomenthone with 18% of *l*-menthone. Similar experiments with *d*-pulegone (V) and *l*- Δ^4 -p-menthen-3-one (VI), in which carbon atom

(1) is the original asymmetric centre, yielded mixtures containing only 52% and 60%, respectively, of *d*-isomenthone (Table A).

No matter which of the two asymmetric centres (1 or 4) is present in the original molecule, the predominating product is thus isomenthone, or *cis*-menthone (*vide supra*): piperitone, however, affords the highest yields of this ketone, undergoes hydrogenation most easily, and has the additional advantage of ready accessibility in *l*-, *d*-, and *dl*-forms. That the above products do not consist of "partly racemised *d*-menthone," as stated by Skita and Ritter (*Ber.*, 1910, **43**, 3394) in the case of *d*-pulegone, is shown by the magnitude of their optical rotations; moreover, the "inversion" mixtures furnished by them are practically identical with those furnished under similar conditions by *l*-menthone.

The hydrogenation product of *l* piperitone, having the approximate value $[\alpha]_D +70^\circ$, forms a viscid oxime, which upon reduction yields a mixture of menthylamines. Upon fractionally crystallising the mixed hydrochlorides, the main constituent, having $[\alpha]_D +23.6^\circ$ in dilute aqueous solution, is readily obtained pure. From its mode of formation it appears to be the analogue of *l*-menthylamine in the *iso*-series; moreover, like *l*-menthylamine, it yields a crystalline menthol in reaction with nitrous acid. It has therefore been named *d*-isomenthylamine, the corresponding menthol (m.p. 81.5°) being called *d*-isomenthol. The last-named substance, when carefully oxidised with Beckmann's chromic acid mixture, yielded *d*-isomenthone having $[\alpha]_D +91.7^\circ$, and as the "inverting" action of this reagent under the adopted conditions was found to be slight, the preparation was probably contaminated only to a small extent with *l*-menthone. These results bear out the substantial accuracy of Beckmann's earlier observations (*vide supra*). Accepting the above specific rotation for *d*-isomenthone and the maximum value $[\alpha]_D +29.60^\circ$ for *l*-menthone (*Journ. Chem. Soc.*, 1926, 2210), it appears that the "inversion" of *l*-menthone, or *d*-isomenthone, through the agency of alcoholic sodium ethoxide, heat (200°), or cold strong sulphuric acid, gives rise to mixtures containing about 30%, 37%, and 46%, respectively, of *d*-isomenthone.

By using the same series of reactions it is obviously possible to proceed from *d*-piperitone and *dl*-piperitone to pure *l*-isomenthone and *dl*-isomenthone, respectively; all the operations distinguished by means of an asterisk in Table B have actually been conducted with both enantiomorphous forms of the substances concerned, while those in which the externally compensated substances have been used are marked with a dagger.

TABLE B

d-isoMenthone is best characterised through the oxime hydrochloride, m.p. 132° , $[\alpha]_D +38.6^\circ$ (chloroform); the pure oxime is a viscid oil. *dl*-Menthoneoxime, which forms well-defined anorthic crystals, m.p. $99-100^\circ$, may be prepared directly from the crude *dl*-isomenthoneoxime obtained in the hydrogenation of *dl*-piperitone by Paal's method, or by the alternative method indicated in Table D. Owing to the occurrence of "inversion," the hydrogenation of *dl*-piperitone at 180° in the presence of finely divided nickel (Smith and Penfold, *J. Proc. Roy. Soc. N.S. Wales*, 1920, **54**, 40) yields a mixture of *dl*-menthone and *dl*-isomenthone in which the former ketone predominates (Read and Robertson, *Journ. Chem. Soc.*, 1926, 2215). In no circumstances has catalytic hydrogenation of a menthenone yielded pure isomenthone, and the pure *d*-, *l*-, and *dl*-forms of this ketone can be obtained only by a careful oxidation of the corresponding isomenthol (Table B). The crude hydrogenation products from *l*-, *d*-, or *dl*-piperitone yield mixtures containing about 70% of *d*-, *l*-, or *dl*-menthone, respectively, when equilibrated with alcoholic sodium ethoxide, and these are the purest preparations of menthone which have been produced by a direct process from piperitone.

Menthols and isoMenthols.—The preparation of *d*-, *l*-, and *dl*-isomenthol from *l*-, *d*-, and *dl*-piperitone, respectively, through the corresponding isomenthylamines, has been outlined above (Table B). Mixtures of *d*- and *l*-isomenthol form a conglomerate (*Journ. Chem. Soc.*, 1927, 1281). Table C summarises certain physical properties of the known menthols (cf. *Journ. Chem. Soc.*, 1912, **101**, 110).

	Menthols			neoMenthols			isoMenthols

$[\alpha]_D$	+49°	-49°		+19.6°	-19.6°		+27.0°	-24.1°	
	(in alcohol)			(no solvent)			(in alcohol)		

The evidence adduced below for the menthylamines leads to the following relative molecular configurations for these three series of menthols and the as yet unknown *neoisomenthols* :—

When *l*-, *d*-, or *dl*-piperitone are reduced directly with sodium and alcohol, the resulting mixture of externally

compensated menthols consists largely of *isomenthols* (*Journ. Chem. Soc.*, 1925, 127, 2782), but *dl*-menthol also is present (*Journ. Chem. Soc.*, 1927, 1282). Upon oxidising this crude mixture with chromic acid and reducing the resulting mixture of *dl*-menthone and *dl*-isomenthone with sodium and alcohol, the yield of *dl*-menthol is considerably augmented. An identical result is obviously attained by the alkaline reduction of the mixtures of these ketones produced in the catalytic hydrogenation of *dl*-piperitone in the presence of colloidal palladium or finely divided nickel. By separating and oxidising the resulting crystalline *dl*-menthol it is possible to pass from *dl*-piperitone to pure *dl*-menthone. Some of these operations are summarised in Table D.

TABLE D

(5) <i>dl</i> -Menthone	(8) <i>dl</i> -Menthone

The passage from *l*(or *d*)-piperitone to *l*(or *d*)-menthol is possible by carrying out operations (6) and (7) shown in Table D. Although *l*(or *d*)-menthol does not crystallise from the optically active reduction product (7) as readily as *dl*-menthol does from the corresponding inactive mixture, a recent observation indicates that it may be isolated in the form of *l*(or *d*)-menthyl hydrogen phthalate without difficulty.

Menthylamines and isoMenthylamines. *dl*-Menthylamine, prepared by reducing *dl*-menthoneoxime (Table E), was found to be distinct from Wallach's "*i*-menthylamine," mentioned above. The optical resolution of this base presents remarkable difficulty, but a pure specimen of *d*-menthylamine has recently been prepared by this method; all three of the stereoisomeric menthylamines have thus been rendered available. When treated with nitrous acid, *l*-menthylamine yields *l*-menthol as the main product; the accompanying small amount of partly racemised *d*- Δ^3 -menthene appears to be produced as the result of a Walden inversion, leading to the formation of *d*-neomenthol or a related intermediate, which then suffers dehydration (*vide supra*). Configuration (XI) is therefore assigned to *l*(or *d*)-menthylamine.

TABLE E
dl-Piperitone

<i>dl</i> - <i>iso</i> Menthone		<i>dl</i> - <i>iso</i> Menthoneoxime
<i>dl</i> -Menthol (Table D)		
<i>dl</i> -Menthone	→	Formyl <i>dl</i> -neomenthylamine
<i>dl</i> -Menthoneoxime		<i>dl</i> - <i>iso</i> Menthylamine
<i>dl</i> -Menthylamine		<i>dl</i> - <i>iso</i> Menthol [+ <i>dl</i> - Δ^3 -Menthene]
<i>dl</i> -Menthol [+ <i>dl</i> - Δ^3 -Menthene]		

Wallach's "*R*-menthylamine" can be prepared, together with *l*-menthylamine, by heating either *l*-menthone or *d*-isomenthone with ammonium formate. In reaction with nitrous acid it yields partly racemised *d*- Δ^3 -menthene, presumably via *d*-neomenthol or a related intermediate, as the main product, but it has recently been found that a small quantity of *l*-menthol is produced simultaneously. "*R*-menthylamine" is therefore to be regarded as a derivative of *l*-menthone; it has been renamed *d*-neo-menthylamine, and configuration (XII) has been assigned to it. The *l*- and *dl*-forms of this base have also been rendered available (Tables B and E). The neomenthylamines differ from the stereoisomeric bases in yielding hydrochlorides which melt below 200° and dissolve in light petroleum; they are also noteworthy by reason of the beauty of their crystalline derivatives. An exceptional relationship is presented by formyl-*d*-neomenthylamine and formyl-*dl*-neomenthylamine, which yield closely related orthorhombic crystals; those of the *d*-compound are holohedral, while solutions of the *dl*-compound deposit right- and left-handed crystals possessing only a faint optical activity in alcohol solution.

d-, *l*-, and *dl*-Menthylamine have been prepared by reducing the corresponding isomenthoneoximes (Tables B and E). *d*-*iso*Menthylamine, which reacts with nitrous acid to give *d*-isomenthol and partly racemised *d*- Δ^3 -menthene, has been assigned configuration (XIII).

Owing to the "inversion" which undoubtedly occurs when *l*-menthone is heated with ammonium formate, it appeared necessary that the product should contain the *iso*-analogues of *l*-menthylamine and *d*-neomenthylamine, and a representative of the remaining group of these stereoisomeric bases has recently been isolated from the mixture of formylated menthylamines furnished by this reaction. The new base, which is feebly dextro-rotatory, has been named *d*-neoisomenthylamine (XIV); but apart from the hydrochloride, its derivatives are mainly laevo-rotatory.* In reaction with nitrous acid it yields partly racemised *d*- Δ^3 -menthene, which is probably associated with a little *d*-isomenthol. Thus, Δ^3 -menthene appears to be invariably produced, in lieu of neomenthol or neoisomenthol, in the interaction of nitrous acid with menthylamines.

It is of interest that the following configurational scheme, which has been evolved for the stereoisomeric menthylamines, leads to the configurations for menthol and neomenthol (VII and VIII) suggested by Zeitschel and Schmidt (*vide supra*):

All four bases, when treated with nitrous acid, yield

* An account of this base and certain of its derivatives will appear shortly in the JOURNAL OF THE CHEMICAL SOCIETY.

varying amounts of *d*- Δ^3 -menthene; in the molecule of this substance carbon atom (1) alone retains its asymmetry, and a proof is thus afforded of the similar spatial disposition of the groups about this atom, as indicated in the above configurational formulæ for the molecules concerned.

The hydrochlorides of the last three of these bases possess almost identical optical rotatory powers in dilute aqueous solution, the respective values of $[\alpha]_D$ for the complete series being -36.6° , $+21.5^\circ$, $+23.6^\circ$, and $+20.9^\circ$; the separation by ordinary methods of these hydrochlorides is impracticable, and a similar difficulty is presented by mixtures of their externally compensated forms (cf. Read and Shannon, *Journ. Chem. Soc.*, 1926, 2232). The acyl derivatives and other substitution products furnished by the optically active bases exhibit widely different values of $[\alpha]_D$ in chloroform solution (Table F).

TABLE F

Values of $(\alpha)_D$ for menthylamine derivatives in chloroform solution

Derivative	<i>l</i> -	<i>d</i> -neo-	<i>d</i> -iso-	<i>d</i> -neois-
Benzylidene	-132.5°	+61.7°	+60.7°	-34.2°
Salicylidene	-119.2°	+30.0°	+77.0°	-17.9°
Formyl	-83.8°	+53.8°	+31.3°	-3.0°
Acetyl	-81.7°	+53.0°	+30.7°	-2.6°
	(XI)	(XII)	(XIII)	(XIV)

A comparison of these values with the above configurational scheme indicates that the reversal of the asymmetry of carbon atom (3), to which is attached the characteristic amino-group, changes the sense of the optical rotation; this remains unaltered, however, when the asymmetry of either carbon atom (1) or (4) is reversed. It is evident also that the menthone derivatives possess higher optical rotatory powers than the analogous isomenthone derivatives. In passing from the benzylidene derivative to the salicylidene derivative of the same base the numerical value of the optical rotatory power decreases, and a similar change accompanies the passage from the formyl derivative to the acetyl derivative. The most interesting numerical relationships are shown by the last-named derivatives. Considering them independently, it is seen that in both instances the sum of the values of $[\alpha]_D$ for configurations (XI) and (XII) is practically identical with the sum for configurations (XIII) and (XIV), the sign being, however, reversed; moreover, configuration (XI) may be coupled with either of the remaining configurations, (XIII) or (XIV), with similar results. These striking coincidences suggest that important information concerning the principle of optical superposition may accrue from a further study of optical rotatory powers in this unique series of stereoisomeric compounds.

CANADIAN INDUSTRIAL NOTES

Arrangements have been completed for the establishment of a beet sugar industry in the Fraser Valley, B.C., by a British company. Scottish and English labour will be settled in the valley for the cultivation, and also operation of the sugar refinery.

The Nipigon Corporation, which has been operating a sulphite pulp mill at Nipigon, has arranged to construct a paper mill of 200 tons daily capacity at Port Arthur, Ontario. This will be the first unit of a 400-ton mill. The completed mill will cost \$7,000,000. There are already two large paper mills in Port Arthur.

A NEW TYPE OF CONTINUOUS FILTER

A distinctly novel type of continuous vacuum filter known as the Dorco filter has been recently introduced into chemical and metallurgical practice. Several special features of this filter give it a relatively wider field of application than the usual types.

The machine is a vacuum filter of the rotary drum design containing a filter medium on the inside of the drum, this filter medium being divided into sections or panels making it possible to change the cloth panel by panel if desired. One end of the drum is open for the introduction of the feed, the removal of cake and the inspection of operation, and as the drum itself acts as a container for the pulp being filtered the necessity for a tank with agitating mechanism is entirely eliminated. (See Fig. 1.) Arrangement is made so that in the event

SECTIONAL ELEVATION

FIG. 1

of overfeeding the machine the surplus pulp will pass to a spillage tank.

A trunnion bearing supports the filter at the closed end, while at the open end support is given by a tyre bearing on rollers. The drum is rotated by means of a worm and worm gear drive, and turns in a clockwise direction.

Suction for cake formation, drying and washing and pressure air for cake discharge are applied to the panels through a port valve of the usual type adjacent to the trunnion support. All piping is placed on the outside of the drum, and is readily accessible.

The filter is particularly suitable for pulps containing granular material which settles out rapidly, for the segregating material falls into position on the filter medium. In drum and tank types of machine, segregation hinders the work of the filter as the granular material forms banks on the bottom of the tank and allows the finer material to be drawn on to the cloth first, so tending to cause clogging. In the Dorco filter a natural filter bed is formed. This is of much importance in the filtration of fine coal and many pulps occurring in ore-dressing work.

The cake so formed on the inside of the drum is carried round to a point beyond the top of the machine where the filter cloth is caused to suddenly expand and contract, so that the cake falls readily and freely, leaving the medium clean. The solids drop into a hopper

FIG. 2.

situated inside the drum and are removed by a screw conveyor. (See Fig. 2.)

To demonstrate the advantages of this filter careful comparison between a Dorrico filter and a drum and tank type was made at the mill of one of the large copper companies. The machines were operated in parallel, receiving a thickened feed of flotation concentrates from a Dorr thickener. The following figures give the results of a 20 days' test:

Note: - Operating labour not included.

The mill where these results were obtained operates a gravity-concentrating plant as well as a flotation plant, and although it had always been desirable from the point of view of the smelter to mix and dewater the two types of concentrate together, limitations of the drum and tank filter prevented that being done. The table concentrates had to be dewatered in classifiers provided with suction boxes. After the trial of the Dorrico filter on flotation concentrates, it was decided to send the entire gravity concentrates to the trial filter along with the flotation concentrates. The following excellent result was obtained, enabling a substantial reduction to be made in the cost of handling concentrates.

THE REFUSE OF THE CITY OF SYDNEY AND ITS DISPOSAL*

By ROLLO KEITH NEWMAN, B.Sc., A.A.C.I.

The problems connected with the disposal of refuse have for many years commanded an increasing amount of attention throughout the cities of the world, both on account of the vast quantities of waste materials that have to be disposed of, and also on account of the great costs involved. It is estimated that in the towns and cities of England and Wales alone 10,875,540 tons of refuse have to be collected and disposed of annually at a cost to the ratepayers of £7,500,000. Many efforts have been made to cheapen the costs of collection, and to determine the most economical and efficient means for disposal. Both aspects of the work have interesting features, but it is only with the question of disposal that this paper deals.

In certain American cities, where it is the general practice to collect ashes, rubbish and food waste in separate containers, these three materials are separately disposed of. The ashes, being innocuous, are used for land reclamation or some similar purpose; the rubbish, after removal of saleable constituents, is incinerated; and the garbage or food waste is treated by the reduction process. This process, of which there are several modifications, consists essentially in drying the garbage, extracting the grease for sale, and grinding the degreased residue for sale either as a fertiliser base or stock fodder. In the most modern plants treatment of the garbage is carried out in closed digesters of 3–5½ tons capacity, fitted with a stirring device, steam-jacketed, and connected to a condenser. There is added to the garbage in the digesters a quantity of petroleum naphtha or low-grade kerosene, and the temperature is raised to between 170° F. and 196° F. by means of the steam jacket. The water contained in the garbage and the solvent form a low boiling-point mixture, and distil off. The garbage is thus dehydrated, and after condensation the solvent is separated from the water and used again. When dehydration is practically complete, there remains in the digester with the garbage a certain amount of solvent saturated with grease. This is run off to a settling tank, the contents of the digester are washed with solvent two or three times, and then heated to drive off the last traces of solvent through the condenser. The dry residue is called "tankage," and, after grinding, is sold.

The grease-saturated solvent in the settling tanks is distilled, the solvent recovered, and the grease run into barrels for shipment. This process has been successfully used in some cities for the past twenty years; but, on the other hand, several plants have failed on account of erratic profits and the tendency to cause nuisance from odour.

In England, where refuse is collected in a mixed condition, and consists largely of ashes from domestic fires, either wholesale incineration in destructors, or incineration after the screening out of dust and fine ashes and the salvage of saleable materials, is generally used for disposal. The refuse of Halifax,¹ however, is

now being treated in a modified producer-gas plant, and is said to yield 47,000 cb. ft. of gas per ton. Such gas usually has the composition² CO₂, 3.5%; CO, 23%; O₂, 1.9%; H₂, 13%; CH₄, 2.1%; N, 56.5%; and the calorific value is approximately 130 B.Th.U. per cb. ft. It is suitable for use in gas engines or for boiler firing.

At Bury, Lancashire, and in parts of France, refuse pulverised to a homogeneous mass is sold to farmers for use as fertiliser.

In some of the cities of Italy refuse is converted to innocuous fertiliser by storage for 30–40 days in so-called zymothermic cells, under conditions which are favourable to the aerobic bacteria and inimical to the anaerobic. The fixed nitrogen in the gases liberated by the activity of the micro-organisms is collected in absorption towers situated over the cells.

From Regina, Canada, and from certain districts in America successful alcoholisation of refuse is reported. Such refuse probably contains much fruit waste. Several American cities of considerable size feed all garbage to hogs, and it is claimed that, when practicable, this method is the most advantageous of all from the financial point of view.

It will be seen from these brief descriptions that considerable differences exist between the various disposal methods in use. This diversity is due to the variations in climatic conditions, which exert a great influence on the composition of the refuse, to different methods of collection, to differences in the industrial nature of the localities concerned, and, to a certain extent, to different degrees of fastidiousness of the people.

The information given in this paper was obtained during an investigation conducted in 1925 to determine the nature of the refuse of the city of Sydney, and the most economical and efficient means for its disposal, taking due account of all local conditions.

Quantity and physical composition of City of Sydney refuse

The total amount of refuse disposed of annually in this city (resident population 110,000, excluding suburbs), including street sweepings and uncombustible material, exceeds 80,000 tons, but it is only proposed to deal here with the refuse burnt at the destructors, which amounts to 37,000 tons p.a. This consists of three principal types: household refuse, collected in the residential districts; trade refuse, collected from factories, shops, offices, and warehouses; and a third type, intermediate in composition between the former two, collected in the city at night and in the early morning, and called hereafter, for the sake of convenience, city refuse.

In order to determine the average composition of these types, 141 typical loads, weighing altogether 169,299 lbs. were completely and systematically sorted out. The sorting analyses were spread over a period of nine months to permit seasonal changes to exert their due effect upon the averages. The seasonal changes in the refuse of Sydney were found, however, to be practically negligible. In the cities of colder countries the output of

* Read before the Sydney Section, Australia, on June 9, 1926.

1 "The Cleansing Superintendent," Aug., 1924, p. 318.

2 Chem. and Met. Eng., Aug. 4, 1924, Vol. 31, No. 5, p. 191.

ashes from domestic fires increases greatly in the winter, and this material may constitute 80% of the refuse. In Sydney this is not so, since the average figure for screenings and ashes for 65 loads sorted between March and August was 12.71% and the average figure for 76 loads sorted between September and December was 18.45%. (The difference between these figures (5.74%) is due to an increase in the street sweepings occurring in the latter group of loads.) In Table I, the quantity of each of the three types of refuse disposed of, and the composition, as ascertained by the sorting analyses, is shown:—

TABLE I

Quantity per annum Composition	Quantities and composition of the three chief types of refuse destructors			Quantity of the trade refuse 6601 tons
	Household refuse 23 654 tons	City refuse 6968 tons	Trade refuse 6601 tons	
Garbage	56.54	32.97	22.93	
Paper and cardboard	10.15	36.31	18.27	
Screenings and ashes	17.39	21.21	7.93	
Rags, bags, straw, wood, etc.	3.90	3.15	13.36	
Tins, scrap iron, glass crochery, etc.	6.02	6.03	7.51	
	100.00	100.00	100.00	

Household refuse constitutes 63.54% of the whole, city refuse 18.72%, and trade refuse 17.74%. The composition of the mixed refuse, as burnt at the destructors, is therefore as shown in Table II:

TABLE II

General average composition of mixed refuse

Quantity burnt per annum	37,226 tons

There is a marked resemblance between the figures for Sydney and Toronto, the latter representing the result obtained for the sorting analyses of 21,000 lb. of refuse in October, 1914. The figures given for the other cities, however, which represent yearly averages, show a much greater proportion of screenings and ashes, due to the occurrence of ashes from domestic fires, the output of which in the colder climates is enormous.

The chemical examination of refuse materials

A series of chemical examinations of the various constituents of refuse was carried out to determine fuel value, and, in the case of garbage, the grease content and fertiliser value in addition.

To obtain representative samples of garbage, the entire quantity of this material, removed from a typical load, was passed through a mill and pulverised to a more or less homogeneous mass. This was reduced, by the usual quartering method, to a sample of 2—3 cb. ft., which was again passed through the mill, to be further mixed and comminuted, and then reduced by quartering to a quart sample for the laboratory. Two hundred grams of this sample was dried for 18 hrs. at 100° C., and then reduced to a fine powder in a hand grist mill. The analyses were carried out on this powder, and calculated back to the wet basis. A similar method of sampling was employed for paper and certain portions of the combustible rubbish such as bags, and rags.

The screenings and ashes were always in a sufficiently finely divided condition to be sampled directly by the quartering method, and the laboratory sample, after drying, was ground in the hand grist mill to a fine powder.

Samples were taken during a period of nine months to enable the observation of the effects of seasonal changes and rainfall on refuse materials. From the results it appears that the absence of climatic extremes in Sydney, results in a certain uniformity in refuse throughout the year in so far as water content is concerned.

The grease content and fertiliser constituents of garbage were also comparatively unaffected by season, as is shown in Table IV.

TABLE IV

Period	Seasonal changes in fertiliser value and grease content of garbage	
	May—August 35	September—October 25
Number of samples	—	—
Nitrogen	0.70	0.77
K ₂ O	0.11	0.12
P ₂ O ₅	0.77	0.56
Ether extract	2.63	3.08

This result agrees with that obtained in Washington,⁸ U.S.A., where it was found that seasonal changes, or changes in the nature of the people (i.e., rich or poor) from which garbage is collected, alike produce differences small enough to be regarded as unimportant. Such small changes as do occur in Sydney, however, have produced their due effect on the figures given hereafter, which may be regarded as correct yearly averages.

Fuel value of refuse

Following are the averaged results for a series of proximate analyses and determinations of calorific value. Altogether 180 samples, taken between April and December, were examined, and the results are shown in Table VI.

⁸ J. Ind. & Eng. Chem., Jan., 1917, p. 49.

TABLE V
Proximate analyses of refuse materials

	Garbage	Screenings and ashes	Paper	Combustible rubbish
Number of samples ..	81	82	13	4
	%	%	%	%
Water ..	44.71	26.53	24.48	10.94
Volatile combustible ..	18.97	14.95	05.03	77.03
Fixed carbon ..	10.68	6.97		
Ash ..	25.64	51.55	110.49	11.13
Calorific value in B.Th.U. per lb. ..	3007	2223	5336	4518

The calorific values for garbage and paper were determined in a bomb calorimeter, but reliable determinations of the calorific value of screenings and ashes could not be made in that way. It was therefore calculated on the assumption that the combustible in this material had the same value as the combustible in garbage. The calorific value of the combustible rubbish was calculated from the values generally accepted for its constituent materials.

From the results shown in Table V and from the known average composition of mixed refuse (Table II), its proximate composition and calorific value were calculated in the manner shown in Table VI.

TABLE VI
Proximate analyses of mixed refuse

Composition	Water	Combustible	Ash	Calorific value in B.Th.U. per lb.
	%	%	%	
Garbage .. (46.17)	20.61	13.69	11.84	1388
Paper and cardboard (25.62)	6.27	10.66	2.69	1367
Screenings and ashes (16.43)	4.36	3.00	8.47	365
Combustible rubbish (5.49)	0.60	4.28	0.61	218
Incombustible rubbish (6.29)	—	—	6.29	—
(100.00)	31.87	38.23		

In Table VII the fuel value of Sydney refuse is compared with that of certain other cities.

TABLE VII
Fuel value of Sydney refuse compared with that of other cities

City	Water	Combustible	Ash	Calorific value in B.Th.U. per lb.
	%	%	%	
San Francisco ⁹	49.00	22.90	27.20	2410
Borough of Richmond (New York) ¹⁰	30.10	34.90	35.00	4141
West New Brighton (New York) ¹¹	45.10	40.40	14.40	4300
King's Norton (near Birmingham) ¹²	12.12	46.18	41.70	3000
				4300
				4500
				4500
Paris ¹³	—	—	—	—
Copenhagen ¹⁴	28.50	30.00	41.50	—
Hamburg ¹⁵	13.00	23.50	63.50	—
Berlin ¹⁶	22.00	13.10	64.90	1314
				1890
Sydney	33.84	36.71	29.65	3368

The comparison shows that in water content and ash the refuse of Sydney resembles that of the American cities more closely than that of the European cities, but the calorific value obtained for Sydney (3368 B.Th.U.) is almost exactly the mean of all other values quoted (3373 B.Th.U.).

Fertiliser value and grease content of refuse material

In addition to ascertaining fuel values, work was carried on with a view to determining the fertiliser value and grease content of garbage alone, and of household refuse as a whole.

The averaged results for the analyses of 81 samples of garbage sorted out from household refuse between April

⁹ to 16 Collection and disposal of municipal refuse, Hering & Greeley, pp. 18, 58, 61, 71, 72, 73, 75, and 78.

and November were as follows:—water, 44.71%; ash, 25.64%; nitrogen, 0.74%; K_2O , 0.11%; P_2O_5 , 0.63%; and ether extract, 2.84%. The average saponification value of the grease was 170.

The estimations of nitrogen were made by the Kjeldahl method; the potash by the perchlorate method, after the sample had been saturated with concentrated sulphuric acid and ignited at low red heat, and the phosphorus pentoxide by the volumetric molybdate method, after ignition of the sample.

A comparison of Sydney garbage with that of certain American cities shows there is a marked difference between the figures. This is probably due to the fact that the American garbage analysed was collected separately, and not mixed, either in the dustbin or the collecting cart, with rubbish or dirt. It was therefore practically pure food waste. The Sydney garbage analysed was, on the other hand, collected together with paper, rags, rubbish, and street sweepings, and subsequently separated, with the result that a considerable proportion of the water, originally in the garbage, was absorbed by these materials. The admixture of the garbage with street sweepings also resulted in the adherence to the wet food waste of a certain amount of dirt and manure, which was not capable of being completely removed by screening, and remained to increase the ash figure. The grease content was reduced by the contact of the garbage with paper, since dirty paper, sorted from household refuse, contains 2.22% of grease in addition to 36.88% water. It is probable that, in the event of the establishment of a separate collection system in Sydney for garbage alone, the material so collected would closely resemble in analysis the average American garbage, as shown in Table VIII.

TABLE VIII
Average composition of American garbage and probable composition of Sydney garbage if separately collected

	%
Water ..	75.00
Combustible ..	20.80
Ash ..	4.20
Nitrogen ..	0.62
K_2O ..	0.28
P_2O_5 ..	0.33
Ether extract ..	4.08

The average analysis of nine samples of household refuse, obtained by pulverising entire loads without any sorting, except the removal of materials which might have injured the mill, is given in Table IX.

TABLE IX
Average analyses of nine samples from household refuse loads pulverised without sorting

	%
Water ..	40.72
Ash ..	31.13
Nitrogen ..	0.62
K_2O ..	0.09
P_2O_5 ..	0.67
Ether extract ..	2.41

Disposal of Sydney refuse

Space will not permit a recounting of the various reasons for the decision reached regarding the most suitable disposal method for use in Sydney. Suffice it to state that after close enquiry into, and careful consideration of, the various successful disposal methods, the nature of the refuse, the local conditions, costs, health considerations, and all other factors being taken into account, it was decided that the separation-incineration

process, which consists in screening out dust and fine ashes, removing saleable materials, and incinerating the remainder, was most suitable for use in Sydney. This process, which is widely used in Great Britain, operates as follows:

The refuse loads, upon arriving at the plant, are tipped into hoppers, which feed, in some cases automatically, into rotating or vibratory screens, with a mesh of size, determined by experiment, to best permit the escape of dust, cinders, and other practically incombustible material. The screenings are disposed of by use for land reclamation, by punting to sea, or in some cities by use as filler in prepared manures. The refuse held in the screens passes to a moving conveyor belt, usually of rubber composition, and of width, length, and rate of travel designed to suit conditions. This belt travels between pickers who remove certain saleable materials other than paper or metals, and throw them into separate bins, from whence they are removed for baling and selling. At a certain point over the belt an exhaust hood is arranged to suck up paper and other light materials by air draught, and pass them through a screening device which serves to separate straw and dust etc. from the paper. The clean-dusted paper is baled, and sold for re-manufacture.

Near the end of the belt a rotating electro-magnet removes tins and scrap iron, and the refuse remaining on the belt passes to the destructor, which is specially designed to burn wet materials, of comparatively poor calorific value, without smoke or objectionable odour. The heat resulting from the combustion of the refuse is used to generate steam in water-tube boilers, and to prevent the forced draught used to facilitate incineration. The steam generated is always more than sufficient to provide all the power necessary for the operation of the plant, and, in addition, there is generally a large excess of heat available for use in any required manner.

The clinker produced by the incineration of the refuse is used in many places for concrete and ornamental cement work, for making and surfacing roads and foot-paths, and in certain classes of bricks. It has usually the composition: moisture and combustible 4.46%, silicious matter 55-65%, iron oxide and alumina 20%, CaO, P₂O₅, Mn₂O₃, ZnO, K₂O, Na₂O, SO₄, etc., 6-15%, MgO traces.

Results of introduction of separation-incineration method in Sydney

The use of this method in the treatment of Sydney refuse would result in the separation of 6116 tons of screenings and 5317 tons of saleable materials annually, and a consequent reduction in the quantity burnt of 11,433 tons. The refuse remaining to be incinerated would have the composition and fuel value shown in Table X.

Comparison with figures for the unsorted refuse shows that although the water content is increased by separation, the calorific value is unaffected, and the ash reduced. This reduction in ash, together with the reduction in the quantity burnt, means a total reduction of the clinker output from the destructor of 50% of the present figure.

TABLE X
Composition and proximate analyses of refuse after screening and removal of saleable materials

	%	Water %	Combustible %	Ash %	Calorific value B.Th.U. per lb.
Garbage	(69.88)	31.14	20.06	17.86	2095
Dirty paper	(21.77)	8.03	11.25	2.40	964
Combustible rubbish	(7.30)	0.80	5.09	0.81	330
Incombustible rubbish	(1.25)	—	—	1.25	—
	(100.00)	39.99	37.60	22.41	3380
(Cl. before sorting Table VI)		31.87	38.23	20.90	3368

The effect of the new method on costs may be briefly indicated thus:—

A reduction in the total quantity burnt of 33%.

Disposal of the screened and sorted material at an average cost per ton, equivalent to 16% of the present cost per ton of incineration.

Incineration of the remaining material at a rate 60% of the present cost per ton owing to increase of burning efficiency, and decrease of clinker output resulting from screening and sorting.

In concluding this paper, I wish to acknowledge my thanks to Mr. L. Stevenson, the City Cleansing Engineer, and to Mr. W. G. Layton, the Town Clerk, for permission to publish this work. I wish also to acknowledge my thanks to Mr. D. C. Archer, B.Sc., who, as my assistant, carried out a great deal of the analytical work.

City Cleansing Department, Sydney

THE ASSOCIATION OF BRITISH PAINT, COLOUR, AND VARNISH MANUFACTURERS

The laboratories of the Research Association of British Paint, Colour, and Varnish Manufacturers were officially opened at a luncheon held in the Clarence Hotel, Teddington, close to the laboratories, on September 21.

Mr. S. K. Thornley, chairman of the Research Association, presided, and amongst those present were: Sir Joseph Petavel, F.R.S., Sir Robert Robertson, F.R.S., Dr. E. F. Armstrong, F.R.S., Lt.-Col. Sir David Prain, F.R.S., Mr. H. T. Tizard, F.R.S., Mr. F. H. Carr, C.B.E., Mr. W. J. U. Woolcock, C.B.E., Mr. J. W. Bispham, Mr. Chatterton, Mr. C. F. A. Hare, Prof. J. W. Hinchley, Mr. Holmes, Mr. C. A. Klein, Prof. T. M. Lowry, F.R.S., Major C. A. Mander, Dr. S. Miall, Dr. H. H. Morgan, Dr. R. S. Morrell, Mr. Selby Wood, and Dr. Weidlein, and the director of research, Dr. L. A. Jordan.

After the loyal toast, Mr. F. H. Carr, C.B.E., President of the Society of Chemical Industry, proposed the toast of the Research Association. There were clear reasons why the paint and varnish industry, he said, must consider that it was a chemical industry, and he considered it a hopeful sign that the industry had shown their appreciation of that fact by establishing their own Research Association for the study and the application of scientific and chemical knowledge to their needs.

Dr. E. R. Weidlein, director of the Mellon Institute of Industrial Research, who seconded the toast, also emphasised the financial value of research, and, in referring

to his own Institute, said that the industries concerned paid \$700,000 a year in support of its work.

Dr. E. F. Armstrong, F.R.S., who said that, in the unavoidable absence of Sir Harry McGowan, he represented Imperial Chemical Industries, Ltd., supported the toast and referred to the importance of nitrocellulose lacquers and the need for the provision of British solvents at prices competitive with those of American products. As no cheap grain was available here, the solvents required would have to be made by synthetic processes from coal.

Mr. C. A. Klein, president of the Oil and Colour Chemists' Association, then proposed the toast of "The Guests," and Mr. W. J. U. Woolcock, C.B.E., general manager of the Association of British Chemical Manufacturers, replied.

The laboratories are installed in a two-storey brick building standing in grounds covering an acre. The chemical and physical laboratories occupy the upper floor, whilst the offices and rooms for technical work and small-scale plant etc. are below. Exhibits relating to the work of the Association were on view. Investigations on the refining of linseed oil, the blooming of varnish, and the question of weathering tests are amongst those in progress.

At the meeting of the Research Association which followed the luncheon, Mr. S. K. Thornley was elected president, and Mr. C. F. A. Hare and Dr. H. H. Morgan were elected vice-presidents.

CANADIAN INDUSTRIAL NOTES

The Dominion Steel Corporation, one of the main components of the British Empire Steel Co., of Nova Scotia, has been ordered into liquidation by a Nova Scotia court. The liquidation proceedings were most strenuously opposed by the president and officials of the "Besco," as it can be interpreted as the process of winding up the latter company, the largest individual organisation in the Maritime Provinces. An appeal against the judgment will be made. The press of the Dominion is, in many instances, most outspoken in regard to the condition of affairs existing, and state "the record of the Nova Scotia coal and steel development is a rather sorry story. In looking back over the situation, the thought recurs that the failure of the Nova Scotia industry to make good has been due to bad management more than anything else." The consensus of opinion, expressed by those familiar with conditions of affairs for the past 30 years, is in agreement with the above editorial comment of a leading Canadian newspaper.

The new oil, fish meal and fertiliser works of the Pender Island Fish Products Co., Ltd., Shingle Bay, B.C., is operating. The raw material is dog fish and offal from the salmon canneries of the Fraser River.

The Canadian Vegetable Oils, Ltd., Vancouver, B.C., will build an oil extraction works at Port Mann, B.C.

A beet sugar factory may be established in the province of Quebec by British interests. Sir George Courthope recently visited Quebec and interviewed Hon. J. E. Caron, provincial Minister of Agriculture, regarding the possibility of locating the factory in Quebec.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on other such occasions as the Council may direct.

ROTHAMSTED LIBRARY

By the courtesy of the Lawes Agricultural Trust, any member of the Society of Chemical Industry, on presenting a card from the General Secretary, shall be allowed access to this Library. The rules of the Library preclude journals and periodicals from being sent out, and these are, therefore, always accessible.

A catalogue of the journals and periodicals is in the Society's Offices at Central House, and may be consulted there by members.

BRISTOL SECTION

The 1927-1928 session of the Bristol Section opens on October 6 with an address by the President of the Society, Mr. F. H. Carr, C.B.E., on "Vitamins in relation to chemistry and medicine." On November 3 Mr. H. H. S. Clotworthy will describe the "Manufacture of viscose artificial silk," and on December 1 Dr. C. H. Lander, the Director of Fuel Research, will address a joint meeting with the Fuel Section on the subject of "Low temperature carbonsation." The subject on January 5, 1928, will be "The catalytic oxidation of aromatic hydrocarbons and their derivatives by means of air," and will be delivered by Dr. E. B. Maxted before a joint meeting with the Chemical Society. On February 2 a paper will be given by Dr. Morris W. Travers, F.R.S., and the session will close with the Annual Meeting on March 1, when Mr. T. Penny will give a paper on "The art of soap manufacture."

CALENDAR OF FORTHCOMING EVENTS

Oct. 3.—SOCIETY OF CHEMICAL INDUSTRY, *London Section. Ordinary Meeting*, at the Royal Society of Arts, John Street, Adelphi, W.C.2, at 8 p.m. "The gas industry, past, present and future," by W. J. A. Butterfield.

Oct. 3.—SOCIETY OF ENGINEERS, *Ordinary Meeting*. Apartments of the Geological Society, Burlington House, Piccadilly, W.1, at 6 p.m. "The lead electric accumulator in practice," by R. C. Hall.

Oct. 4.—INSTITUTE OF METALS, *North-East Coast Local Section*. Electrical Engineering Lecture Theatre, Armstrong College, Newcastle-on-Tyne, at 7.30 p.m. Chairman's address, by H. Dunford Smith.

Oct. 5.—INSTITUTION OF SANITARY ENGINEERS. Opening Sessional Meeting.

Oct. 5.—SOCIETY OF PUBLIC ANALYSTS, Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Oil of *Centrophorus granulatus*," by A. Chaston Chapman. (2) "Investigations into the analytical chemistry of tantalum, niobium, and their mineral associates, IX. The separation of titanium from tantalum and niobium," by Dr. W. R. Schoeller and E. C. Deering. (3) "Determination of aldose sugars by means of chloramine-T, with special reference to the analysis of milk products," by C. L. Hinton and T. Macara. Informal dinner at 6.30 p.m., at St. James's Restaurant, 178, Piccadilly, W.

Oct. 6.—SOCIETY OF CHEMICAL INDUSTRY, *Bristol Section*. The University, Woodland Road, Bristol, at 7.30 p.m. "Vitamins in relation to chemistry and medicine," by the President of the Society, Mr. F. H. Carr, C.B.E. Members of the Institute of Chemistry and fellows of the Chemical Society are cordially invited to attend.

Oct. 7.—SOCIETY OF CHEMICAL INDUSTRY, *Manchester Section*. Chairman's address, by C. J. T. Cronshaw.

Oct. 8.—BIOCHEMICAL SOCIETY. Meeting at Cambridge.

Oct. 8.—WESTERN JUNIOR GAS ASSOCIATION. "Some problems of the near future," by Dr. M. W. Travers.

Oct. 10.—INSTITUTE OF BREWING, *London Section*, Engineers' Club, Coventry Street, Piccadilly, W. Discussion on season's malts (made from 1926 barleys).

Oct. 10.—SIR JOHN CASS TECHNICAL INSTITUTE, Jewry Street, Aldgate, E.C.3, at 8 p.m. Inaugural ceremony.

Oct. 10.—INSTITUTE OF METALS, *Scottish Local Section*. 39, Elmbank Crescent, Glasgow, at 7.30 p.m. Chairman's address by S. E. Flack.

Oct. 11.—INSTITUTION OF PETROLEUM TECHNOLOGISTS. General Meeting. House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m.

Oct. 12.—INSTITUTION OF THE RUBBER INDUSTRY, *London and District Section*, Engineers' Club, Coventry Street, W.1. "Coagulation, structure and plasticity of crude rubber," by Dr. O. de Vries.

Oct. 12.—OIL AND COLOUR CHEMISTS' ASSOCIATION, Rooms of the Royal Society of Arts, 18, John Street, Adelphi, W.C.2, at 8 p.m. Discussion on "Colour standardisation and testing in the paint and colour industry."

Oct. 12.—INSTITUTE OF METALS, *Swansea Local Section*. Thomas' Cafe, High Street, Swansea, at 7.0 p.m. Chairman's address by Capt. L. Taverner.

Oct. 13.—INSTITUTE OF METALS, *London Local Section*. Rooms of the Society of Motor Manufacturers & Traders, Ltd., 83, Pall Mall, S.W.1, at 7.30 p.m. Chairman's address on "Works' economics," by A. H. Munday.

Oct. 13.—INSTITUTION OF THE RUBBER INDUSTRY, *Birmingham and District Section*, Grand Hotel, Birmingham. "Selling," by A. E. Hemsworth.

Oct. 14.—SOCIETY OF CHEMICAL INDUSTRY, *Chemical Engineering Group*, Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "A recent development of spray drying," by J. Arthur Reavell. During the same afternoon a visit will be paid to the Kestner Experimental Works at Camberwell, where a machine of the type to be described in the evening will be seen at work.

CORRESPONDENCE

UTILISING A BROKEN BURETTE

SIR,—The following application of an old idea has, perhaps, the merit of novelty, and may be of use to teachers and students engaged in volumetric work.

Should the tap of a burette get broken, the burette can be made serviceable again by cutting off the end, flaring it and inserting a rubber stopper cut off at an angle, carrying a jet of the shape shown in the sketch.

The jet should turn fairly easily in the stopper whilst still being watertight (this can be secured by slightly greasing the tube with vaseline and a proper choice of

size of tube), but the stopper itself should be a tight fit in the burette in order not to turn when the jet is turned.

The ring marked A is for convenience in turning, and is made by the usual plan of thickening the glass tube.

The device is within the capacity of elementary students to make and fit, and is more convenient than the usual pinchcock and rubber tube, having the advantage of being rigid to work with and not tending to hold air bubbles; moreover, it is fully as sensitive as a stopcock in delivery.

I am,

Yours faithfully,

Chemistry Department,
Technical College, Huddersfield

A. O. JONES

THE PROFESSION OF CHEMISTRY

SIR,—The Journal of the Institute of Chemistry announces that the revised edition of *The Profession of Chemistry* will be sent to persons enquiring for the Regulations "in order that they may be more fully informed as to the profession which they propose to follow."

For the benefit of these a quotation from the list of appointments recently sent out by the Institute may be of interest:—"Experienced, well-qualified analytical chemist required. Candidates must hold a good degree

and have had at least five years' post-graduate analytical experience in some branch other than food and drugs. They must be under 30 years of age, and will have to pass a doctor. Post subject to three months' probation ———."

Here we see the reward that awaits our professional chemist after years of unremunerative study and post-graduate work. He may go for an interview (at his own expense), and if five years of analytical work have left him with unimpaired strength he may "pass the doctor" and be appointed. Then (when the search for lodgings is ended) he settles down to enjoy the mild delight which his new-found wealth provides, for it should be noted that in view of the exacting conditions, the salary for this appointment is £275 to £325 according to qualifications. (In any profession it would be at least treble.) After three months (when the problem may be solved) our professional chemist (with his family, if he has one) may be precipitated into the cold, hard world. But surely it has been worth while. For a brief period of his life a professional chemist has enjoyed a salary equal to that of a foreman, a joiner, or a very junior commercial traveller.

The Times recently had an advertisement for a man to look after swine—at a salary of £400.

Yours faithfully,

"STILL IN IT"

PATENTS AND TRADE MARKS IN THE IRISH FREE STATE

SIR,—The new Industrial Property Act of the Irish Free State comes into force on October 1, as regards patents, designs, and trade marks. Although a period of six months is allowed for taking steps to register rights under existing British patents, it appears probable that this period of grace applies only to the payment of the first fee, and there are many cases in which a renewal fee for a further year will have become due long before this period expires. In such cases the only safe course is to take steps at once to register the patent rights in Dublin, so that any further steps necessary to maintain the rights can be taken in good time.

Holders of British patents, designs, and trade marks who contemplate protecting their interests in the Irish Free State under the new Act will be well advised to communicate promptly with their patent agents in order to ensure that no necessary precautions are overlooked.

A notice as to the coming into force of the Irish Industrial Property Act appears in this week's "Official Journal of Patents."

Yours faithfully,

H. THOMPSON,
Secretary and Registrar,

The Chartered Institute of Patent Agents
Staple Inn Buildings, W.C.1

PERSONAL AND OTHER ITEMS

H.R.H. the Prince of Wales has graciously consented to give his name as a Patron to the Jubilee celebrations of the Institute of Chemistry, which will be held in London from December 14—16, 1927.

The Prince and Princess Ri of Japan, who are on tour in this country, recently visited the East Hecla works of Messrs. Hadfields, Ltd., where they witnessed demonstrations of the Hadfield special "Resistor" bullet-proof steel and inspected exhibits of "Era" steel, projectiles, trackwork, crushing machinery, and other well-known products of the firm.

Sir Alfred Mond will speak before the London Publicity Club on October 10, his subject being "The general industrial outlook and advertising."

Viscount Leverhulme has left England in the *s.s. Arundel Castle* for Natal.

Prof. J. Kenner, F.R.S., professor of organic chemistry in the University of Sydney since 1924, and a well-known worker in the field of stereochemistry, has been appointed to the chair of technological chemistry in the University of Manchester and the Manchester College of Technology, in succession to Prof. F. L. Pyman, F.R.S., who has been appointed head of the research department of Messrs. Boots, Ltd., Nottingham.

Mr. C. E. Mullin, author of "Acetate silk and its dyes," has been appointed head of the Department of Textile Chemistry and Dyeing at Clemson College, South Carolina, U.S.A. Prof. Mullin extends a cordial invitation to all textile technologists to visit Clemson College during the coming year. The United States Government operates a Cotton Testing Station, under the direction of Dr. H. H. Willis, at the college, and some very interesting data are available upon cotton.

Recent promotions in the French order of the Legion of Honour include the names of Prof. H. Le Chatelier, who becomes a Grand-Officier, and of M. H. Pilon, managing director of the Etabl. Gaiffe-Gallot et Pilon, M. Shur, director of the Cie des Produits Chimiques Alais Froges et Camargue, and M. P. Gounod, vice-president of the Union des Industries Chimiques, who become Chevaliers.

We regret to announce the death, at the age of 80, of Prof. A. Liversidge, F.R.S., the distinguished chemist. He occupied the chair of chemistry and mineralogy in the University of Sydney, New South Wales, from 1872 until 1907, when he retired with the title of Emeritus Professor. An original member of the Society of Chemical Industry, he founded the Sydney Section of the Society in 1902, and served as a vice-president of the Society from 1909 to 1912. He published a great many scientific papers and gave valuable service to science in Australia.

The death is announced of Mr. N. B. Gregg, vice-president of the National Lead Company (U.S.A.) and a prominent figure in the American paint and varnish industry. He took an important part in the development of the manufacture of lead products, titanium oxide and barytes by his company, and had an intimate and wide knowledge of the problems of the industry.

The late Mr. A. G. M. Jack, C.B.E., J.P., lately deputy chairman of Hadfields, Ltd., left £108,540, with net personalty £106,527.

The late Mr. J. Hedley, for many years manager of the Muspratt Works of the United Alkali Co., left £13,007, with net personalty £11,393.

The late Mr. J. J. Wooler, a director of the Bleachers' Association, left £114,503, with net personalty £102,612.

The late Mr. G. Randall, J.P., a director of several leather and tanning companies, left £99,198.

The Gas Industry: Past, Present and Future

The inaugural address, on October 3, by the Chairman of the London Section, Mr. W. J. A. Butterfield, M.A., F.I.C., one of the Gas Referees appointed by the Board of Trade, will direct attention to the following points:—

The relative status of the gas industry among public utility services. Gas supply is fundamentally a chemical industry. The inception, development and present position of the gas industry, and the transition from a photometric to a thermal standard. Latitude given by, and performance under, the Gas Regulation Act. Record of the gas industry through the industrial troubles of 1926. The trend of future developments in gas supply.

Spray Drying

A paper of considerable interest is to be delivered before the Chemical Engineering Group on October 14 by Mr. J. Arthur Reavell, who will describe a recent development of spray drying. In the afternoon preceding the meeting a visit will be paid to the Kestner Experimental Works at Camberwell, where a machine of the type to be described in the evening will be seen at work. As this installation is working in connexion with the Merril oil heating process, the visit will prove of further interest to those not familiar with this form of heating. Members desirous of making this visit are requested to notify Mr. H. J. Pooley, the Hon. Secretary of the Group, not later than October 7 (cf. Forthcoming Events, p. 882).

Fusion of Margarine Companies

It is announced that an important international syndicate has acquired the controlling interest in both the Jurgens and Van den Bergh undertakings in all countries. The full individuality of each concern will be maintained, but they will act in close co-operation. The authorised capital of Jurgens, Ltd., which is the English subsidiary of the Dutch company, Anton Jurgens United Margarine Works, is £10,000,000, of which £5,000,000 is issued. Van den Berghs has an issued capital of £3,575,000.

Shale-Oil Industry in New South Wales

After several years spent in the effort to revive the shale oil industry at Newnes, N.S. Wales, the Commonwealth Oil Corporation has decided to abandon its project and dispose of its assets. Although the Newnes shale yields a high percentage of oil, it has not been possible to find a way of working the deposits economically, despite the expenditure of a million and a half sterling. This failure is attributed partly to foreign competition, partly, it is stated (*Ind. Austr.*, Aug. 11, 1927), to labour and industrial conditions.

Chemical Congress in Paris

The Seventh Congress of Industrial Chemistry will be held in Paris from October 16 to 22, at the Rooms of the Société des Ingénieurs Civils. Two days of the congress will be devoted to organic industries and to agriculture and agricultural industries, respectively, and the meetings will close with visits to works in the neighbourhood of Paris.

Phosphatic Fertilisers in France in 1926

During 1926, Morocco exported 885,720 metric tons (721,228 m.t. in 1925) of phosphates; Tunis, 2,815,000 m.t. (2,562,000 m.t. in 1925); and Algeria, 614,000 m.t. (770,065 m.t. in 1925). Of the total imports of phosphate into France, some 160,000—180,000 m.t. is used directly in agriculture, the rest being used for the manufacture of superphosphate. The output of superphosphates increased from 2,380,000 m.t. in 1925, to 2,430,000 m.t. in 1926, exports rose from 229,000 m.t. to 253,000 m.t., and the home consumption remained at about 2,110,000 m.t., which compares with a world consumption estimated at 13,000,000 m.t. Basic slag was produced to the extent of 1,224,412 m.t., compared with 1,090,000 m.t. in Germany; Belgium, 440,000 m.t.; and the Saar, 298,000 m.t. The French consumption of basic slag was 700,000 m.t., and the export (including exports from the Saar) 819,000 tons in 1926. Altogether, about 130,000 m.t. of phosphoric acid was available for French consumption. Good results are anticipated from the "Office de Répartition des Scories," founded in 1926 to regulate the trade in basic slag and to carry out propaganda for its use.

Chemical Industry in Italy

Synthetic indigotin is now being made in Italy by the Fabbria Coloranti Bonelli, at its Cesano Maderno works, which have an annual capacity of 1.5 million kg. of 20% paste. The Italian consumption of indigo is about 600 metric tons a year.

Synthetic Ammonia in France

The synthetic ammonia plant installed at Toulouse in an old State powder factory is now producing at the rate of 50 metric tons of ammonium sulphate a day. It is hoped that by the end of 1928 the annual output will be 150,000 m.t.

Activated Carbon

According to a report from the U.S. Department of Commerce, an American corporation has contracted with the I. G. Farbenindustrie A.-G., the Metallbank & Metallurgische Gesellschaft, Frankfurt-am-Main, and the Aussiger Verein (Czechoslovakia) to exploit German patents on activated carbon in the United States. The French Société de Charbons Actives Urbain has acquired rights in German patents for exploitation in Europe outside of Germany. The Verein für Chemische Industrie, Frankfurt-am-Main, recently entered into an agreement with the Dutch Algemeene Norit Maatschappij on activated carbon. Extension of the number of products is hoped to offset partially the business lost through the competition encountered from synthetic methanol.

Tung Oil from Florida

In connexion with the experimental plantations of the tung tree, which were established some years ago in Florida, the U.S. Dept. of Commerce (Chemical Division) reports that the first experimental crop of tung (Chinese wood) oil has produced a liquid of clearer and brighter colour than the Chinese oil, and it is considered that domestic planting may result in the production of a superior grade of oil, particularly as the tree seems to thrive in certain climates in the United States.

Acetaldehyde and its Derivatives in American Industry

The Rubber Service Laboratories Co., of Ohio, is making acetaldehyde in bulk from acetylene in presence of a mercury catalyst under patents held by the Chemical Foundation. The polymer paraldehyde is prepared, as is aldol in various grades. From aldol the company produces crotonaldehyde, which is used, like acetaldehyde, in making certain rubber accelerators and dyes, whilst the aldol is used as a foaming agent in the flotation of minerals.

United States Mineral Output in 1926

The mineral output of the United States in 1926 was the largest, measured by value (\$6,262,000,000), recorded since 1920, but as prices have decreased, the output represents a considerable advance, being 10% more than in 1925. There was a new record in the output of petroleum, and though there was only a small increase in the value of the metal output, there was a record production of lead and zinc. Production of mercury, antimony, manganese and other metals decreased, imports rising, but there was little change in the value or quantity of the output of aluminium. Non-metallic minerals showed a slight decline, the decline in clay being compensated by an increase in the output of felspar, small increases being shown in various industrial minerals, fertilisers and so on.

Beryllium in Germany

Much interest has been shown in Germany in the properties of beryllium, and in 1923 a society was founded for the study of the metal with a view to its technical utilisation. At present the electro-chemical section of the Siemens and Halske concern is producing 120 grams of the metal a day in an experimental plant. The price has consequently fallen from 200 marks to 6 marks per gram. Beryllium yields a number of interesting alloys, and is used in Röntgen-ray work and in electrical apparatus, and various technical developments would follow if the metal could be obtained in quantity at a suitable price.

Artificial Silk in Greece

Artificial silk is already made in Greece by one company which utilises the cuprammonium process, and intends to increase its output from 200 to 1000 kg. daily. Another company has now been founded to manufacture cellulose acetate silk.

The Swedish Match Trust

It is reported that the Swedish Match Trust has offered to take over the Estonian match monopoly, guaranteeing the Government a yearly income of 60,000,000 Estonian marks. One third of the world's total trade in matches is estimated, on a conservative basis, to be controlled by the Trust. It controls the International Match Co., which was formed to acquire from the parent and other companies the greater part of the entire capital stocks of concerns owning 90 match-making plants in various European and other countries. The production of the International Match is over ten billion boxes of matches annually. The extent of the Swedish Match Trust participation in other enterprises is shown by the figure \$182,687,858 out of total assets of \$391,593,091.

Third Census of Production (1924)—Starch, Blue and Polishes Trades

Below are given particulars of the output in the above trades during 1907 and 1924. The figures for 1924 relate to Great Britain, while those for 1907 are inclusive of establishments in Ireland. The value of the output of the latter was, however, less than 1% of the aggregate shown for the United Kingdom as a whole:—

Products	1924		1907	
	Quantity Cwts.	Selling Value £	Quantity Cwts.	Selling Value £
Starch	461,100	903,000	Not separately recorded	
Dextrine and Farina and potato flour	39,000	56,000		
Other Farinaceous products (including mustard) ..	457,000	1,717,000		
Total (Farinaceous products)	957,100	2,676,000	1,250,000	1,658,000
Trade and household articles for cleansing and polishing (except soap):—			Not separately recorded	
Leather polishes	485,700	2,005,000		
Stove and other polishes ..	598,200	3,055,000		
Other cleansing and polishing articles	--	1,302,000		
Total (cleansing and polishing articles)		6,362,000		2,441,000
Other products		267,000		210,000
Total value ..		9,305,000		4,309,000

In addition to the output of 1,250,000 cwt. of farinaceous products returned in 1907, there were returned on schedules for other trades 566,000 cwt. of similar products valued at £398,000, and a similar large addition will probably have to be made for 1924. A further output of prepared food for infants and invalids was recorded in 1907, the value being £626,000, and the output of such foods in 1924 will have to be brought under review at a later stage. A heavy decline occurred in the output of farinaceous products, the 1924 quantity being less by over 23% than that shown for 1907. No quantitative comparison is possible in the case of cleansing and polishing articles, but the values shown for the two years suggest that the output in 1924 was substantially in excess of that of the earlier year.

Exports of rice starch and other kinds of starch in 1924 amounted to 28,900 cwt., valued at £67,000, and of dextrine and farina and potato flour to 9800 cwt., valued at £18,000, the quantities exported forming about 6% and 25% respectively of the amounts shown as produced during the year. Net imports of rice and other starch in 1924 were 2,005,600 cwt., valued at £1,683,000, and of dextrine and farina and potato flour 798,100 cwt., valued at £737,000.

Of the total quantity of leather polishes produced in 1924 (486,000 cwt.) 81,700 cwt., or about 17%, was exported, the value of exported leather polishes being £497,000. The quantity of stove and other polishes exported was 108,300 cwt., about 18% of the year's production; exports were valued at £538,000, or about £4 19s. per cwt., the average of all such polishes manufactured being about £5 2s. Net imports of polishes of all kinds during 1924 amounted to only 10,600 cwt.

The net output of the factories and workshops in these trades in 1924 was £4,891,000. The net output per head of persons employed during 1924 was £419;

and in 1907 £174. The average number of persons employed at factories and workshops engaged in the industry was in 1924, 11,663, compared with 11,618 in 1907. The total capacity of engines at the factories in 1924 was shown as 8103 h.p., one third of which was in reserve or idle during the year. The 1907 capacity amounted to 9228 h.p. The capacity of electric motors at factories was not ascertained in 1907, but in 1924 motors aggregating 7117 h.p., driven by purchased electricity, were included in the returns. Nearly 13% of the capacity of these motors was shown as in reserve or idle during the year. The capacity of electric generators at factories was given as 402 kw. in 1924, and 970 kw. in 1907.

Third Census of Production (1924) Fertiliser, Glue, Sheep Dip and Disinfectant Trades

Particulars of production in the years 1924 and 1907 in the above trades are given in the table below:—

Products	1924		1907	
	Quantity Tons	Value £	Quantity Tons	Selling Value £
Manures				
Basic slag	96,000	165,000	203,000	277,000
Superphosphates	196,000	560,000	438,000	924,000
Sulphate of ammonia	5,000	57,000	1,000	13,000
Guano, manufactured and compound manures (including bonemeal and other manufactured fertilisers)	101,000	2,601,000	306,000	1,838,000
Total manures	698,000	3,380,000	1,038,000	3,052,000
Sulphuric acid	113,000 Cwts.	296,000	67,000*	94,000*
Glue and size	513,000	812,000	645,000*	573,000*
Gelatin	34,000	201,000		
Animal fat, not refined				
Tallow	6,000 Tons	201,000	18,000	460,000
Other sorts	19,000	650,000		
Bones for manufacturing putty	11,000	86,000		
Bone by-products not included elsewhere	†	32,000	†	105,000*
Disinfectants, insecticides, weedkillers and sheep and cattle dressings	656,000 Cwts.	1,662,000		503,000
Animal foods --				
Oil seed cake	300 Tons	3,000		
Other feeding stuffs				
Sweetened (i.e., containing molasses)	1,000	15,000		211,000*
Not sweetened	18,000	223,000		
All other products		412,000		275,000
Total value		7,982,000		5,308,000

* In order to avoid the possible disclosure of the business of particular firms, the amounts shown in respect of these items are inclusive of the production of factories and workshops in Ireland. The total value so included was £55,000, and this sum has been excluded from the total value of the output shown for the year 1907.

† Recorded by value only

Added to the quantity shown in the table above, the total make of basic slag manure in 1924 was 357,700 tons, an increase of more than 48% over the 1907 production. The output of sulphate of ammonia shown in the above table represents only a fraction of the entire production in Great Britain. Final figures will not be available until the quantities produced by gas undertakings and other works engaged in the recovery of coal tar by-products have been ascertained. In the cases also of sulphuric acid and animal foods the amounts indicated above form only a small part of the aggregate output in Great Britain.

In the 1907 Census between one seventh and one eighth of the output of superphosphates, over one fifth of the total value of all disinfectants, insecticides,

weedkillers, and sheep and cattle dressings, nearly one half of the aggregate production of bones and bone by-products, one eighth of all glue, size and gelatin, and about one tenth of all compound manures produced were returned on schedules other than those for the trades now under review.

The decline recorded in the production of superphosphates in 1924 amounted to 55% compared with the output in 1907, and the quantity of glue, size and gelatin in 1924 was less by about 15% than in 1907. A decline is also indicated in the bones and bone by-products output, for which no quantitative measurement was obtainable in 1907. The production of compound manures on the other hand shows a slight increase, and the comparative values of disinfectants, insecticides, weedkillers, and sheep and cattle dressings made in the two years also indicate an increased production in 1924.

Exports of the main products of these trades were valued at £2,146,000 in 1924, and imports during the same period at £1,331,000. The net output per head of persons employed during 1924 was £227, and in 1907 £154. The net output of the factories and workshops in these trades in 1924 was £2,340,000. The average number of persons employed during 1924 was 10,323, compared with 11,174 in 1907. The total capacity of engines at the factories in 1924 was shown as 16,180 h.p., a little over 23% of this total being idle or in reserve during the year. The capacity returned in 1907 was 20,141 h.p. The capacity of electric motors at factories was not ascertained in 1907, but in 1924 motors aggregating 19,668 h.p., driven by purchased electricity, were included in the returns. Slightly over 9% of the capacity of these motors was shown as in reserve or idle during the year. The capacity of electric generators at factories for 1924 was 3528 kw., and 870 kw. in 1907.

Acquisition of Finnish Chemical Works

It is announced that the oil and chemical works of Richard Meyer, of Reval, comprising 29 different industrial branches with 80 factories, has been purchased by an international syndicate comprising English, French, and Scandinavian interests.

Swiss Exports of Dyes

During 1926 Switzerland exported 5,936,000 kg. of synthetic dyestuffs, an increase of 21% compared with 1915. Germany took 14% and the United States 12% of the total exports.

Barium Products in the U.S.A.

The U.S. Bureau of Mines reports that in 1926 sales of crude barytes rose by 2% to 232,875 short tons (\$1,743,293). Sales of lithopone, ground barytes, and barium chemicals were 159,931 s.t., 52,964 s.t., and 21,911 s.t., representing increases of 10%, 7%, and 17% in quantity, respectively.

An Enquiry

A correspondent wishes to learn of sources of synthetic bitumen. Replies should be addressed to the Editor, CHEMISTRY & INDUSTRY, Central House, Finsbury Square, London, E.C.2.

We have to thank those correspondents who wrote regarding sources of pectin.

REVIEWS

TROCKENTECHNIK. GRUNDLAGEN, BERECHNUNG, AUSFÜHRUNG UND BETRIEB DER TROCKENEINRICHTUNGEN. By M. HIRSCH. Pp. xiv + 366. Berlin : Julius Springer, 1927. Price 31.80 r.m.

The author of this book in his preface sets out to present the reader with a complete and scientific study of drying apparatus; and it must be admitted that, if he has fallen short of his intention, he has made a bold and useful attempt to fulfil his promise in so far as air-drying plants are concerned.

The first 230 pages are occupied by a patient and logical although somewhat laborious development of the theory of air drying. This portion of the book is worth careful study, as the author does something more than merely attempt to baffle the reader with endless arithmetical calculations, but introduces the factors of heat transfer and the hygroscopic properties of the material under treatment in interesting ways. Diagrams are given which enable problems to be solved graphically, and the most important of these, drawn to a large scale, are provided in a pocket at the end of the book together with special paper protractors which are required.

The fundamental diagram employed is that devised by Mollier (*Z.d.V.d.I.*, Sept. 8, 1923), in which the thermal properties of moist air can be conveniently shown. The diagrams employed hitherto have been perhaps less bewildering, and have chiefly shown heat content of moist air plotted against temperature using rectangular co-ordinates: for example Reyscher's book: "Die Lehre vom Trocknen" was based upon a diagram of this kind originally proposed by O. H. Müller. The Mollier diagram, however, shows heat content plotted against humidity and oblique co-ordinates are used. Practically all the thermal data required can thus be obtained into the charts.

The thermal exchanges between the air and the moist material are discussed at length and the notion of "drying potential" is introduced and methods are given whereby the hygroscopic properties of the material can be taken into account in the calculations. Counter current and parallel flow systems are critically discussed and methods are indicated whereby the essential factors in a drying process can be traced out.

The second part of the book is descriptive in character, being made up chiefly from information supplied by makers of drying machinery. This section contains many illustrations of typical plants. The major portion of this section is classified under the headings of materials treated—a very useful arrangement, but hardly in keeping with the systematic character of the remainder of the book. A short description is also given of the instruments available for the control of drying plants.

The two sections of the book seem to be somewhat independent of each other, and after laboriously wading through the first section one is left with the feeling that the scientific treatment should have been carried through into the second section. It must be admitted, however, that in the present state of knowledge, although it is possible to trace many of the physical transformations

which take place in a drying apparatus, the theoretical study of such plants is at present only of value in so far as it indicates "how things vary" and by reason of the critical power imparted. Before theories can lead to a strictly scientific and quantitative basis for design, it will be necessary to apply them to the analysis of the performances of varying types of existing drying plants. The book contains some numerical examples which are most useful from this point of view.

This book demands very careful study, and by no stretch of the imagination could it be regarded as light reading, but it is a serious contribution to chemical engineering literature and one of the best books on drying which has yet appeared. HUGH GRIFFITHS

DAS KIESELSÄUREGEL UND DIE BLEICHERDEN. By Dr. OSCAR KAUSCH. Pp. 292. Berlin : Julius Springer, 1927. Price 29 r.m.

Those who read card indexes read for a specific purpose rather than for general instruction or enjoyment. Dr. Kausch's book is not for the leisure hours of the general reader. It would be of great value to anyone preparing a case for a patent suit. As a review, or rather a series of extracts from the literature and trade bulletins dealing with silica gel and the refining earths, it is excellent and complete. The author does not claim actual experience of the substances with which he deals, and it is apparent that his interest is mainly a documentary one. It is none the less valuable. The fact that he is a leading official in the German Patent Office explains his view-point, and at the same time guarantees that his documentation is thoroughly done.

Silica gel and the refining earths fuller's earth, Florida earth, Death Valley clay, magnesium hydro-silicate and the rest—are substances of great and increasing industrial importance, whose value lies in their peculiar physical structure rather than in their chemical composition. They are substances of ultra-porosity and extreme surface, properties which make them valuable for the recovery of gases and vapours, the refining of mineral and vegetable oils, for pharmaceutical and medical purposes, and as catalysts or carriers of catalysts. The refining earths are natural products, and have therefore less standardised properties than the artificial silica gel; their use is also confined chiefly to the refining of oils. The possible applications of silica gel seem almost unlimited, but at present their development is in its infancy. English readers will perhaps be most interested in its use for the commercial drying of gases, since the first plant on a large scale for the drying of the air blast to blast-furnaces has recently been put into successful operation in Scotland.

The book is complete and accurate as a record of what has been published and patented under the heading of its title. It would have been of greater value had it been more critical, and have given a juster impression to the general reader had it mentioned the existence and compared the merits of rival processes. However, such was not the plan of the author, and his book will be most useful to those who have or anticipate dealings with these interesting products. E. C. W.

COMPANY NEWS

BRITISH DRUG HOUSES, LTD.

The usual quarterly dividend of $1\frac{1}{4}\%$ has been declared on the preference shares, payable on September 30.

BRITISH CYANIDES, LTD.

The report for fourteen months ended June 30, 1927, states that the scheme for the reduction of capital was duly confirmed by the High Court on March 8 last. The new issue of shares was subsequently offered to shareholders, and 273,989 were subscribed. As this was less than half of the number of shares offered, the underwriters were called upon to take up the full number underwritten, so that a total number of 946,827 new ordinary shares have been subscribed. Up to June 30 last 14,920 preference shares of 2s. each have been converted into ordinary shares at the request of the holders. Colonel J. Josselyn, C.M.G., and Mr. B. Fairfax Comgrave have been appointed directors under agreement with the Rock Investment Co., Ltd. The accounts show a loss to date, after special writings-off on reduction of capital, of £946, compared with a loss on trading for the previous year of £23,833, and a total debit balance at April 30, 1926, of £101,083.

ENGLISH CHINA CLAYS, LTD.

A dividend has been declared on the ordinary shares at $3\frac{1}{2}\%$ per annum for the half-year ended June 30, 1927.

EVANS, SONS, LESCHER AND WEBB, LTD.

A dividend of $6\frac{1}{2}\%$ has been declared on the cumulative preference shares for the period July 31, 1926, to December 31, 1926, less tax, payable on October 6.

GLENBOIG UNION FIRE-CLAY CO., LTD.

A dividend has been recommended of 10% for the year, less tax, compared with $17\frac{1}{2}\%$ for last year.

EASTWOODS CEMENT CO., LTD.

The second ordinary general meeting was held on September 20, the chairman, Mr. Horace Boot, presiding. One kiln with a capacity of 50,000 to 60,000 tons of cement per annum had been working since July on trial tests making cement, and would be officially opened at the end of October. Several thousands of tons of cement had been made of a quality superior to the British standard specification, and a number of sales at market prices had taken place. The effect of the general and coal strikes postponed the date for reaching the production stage by several months. The company had given its contracts for the plant and machinery to only first-class British manufacturers. The profit and loss account showed an excess of income over expenditure of £1602, which with £652 brought forward from last year, made a surplus of £2255. The overhead expenses would always be small owing to the close relationship with Eastwoods, Ltd., which gave them the use of their head office premises and the benefit of the services of their staff. When their works were completed, the company would have some of the finest machinery and plant obtainable, and in spite of this the capital cost per ton of cement output would be one of the lowest, if not the lowest, in the kingdom. All the machinery was driven by electricity generated in the company's own power station. The recent heavy drop in the selling price of

cement would affect their profits, although, with their modern plant, it left a fair margin, which was not so with some of their competitors.

BROKEN HILL PROPRIETARY CO., LTD.

The report for the year ended May 31, 1927, states that the coal strike in existence at the close of the previous year continued for the first few weeks of the current period, the effect, however, being counterbalanced to some extent by the coal strike in England which, for a while, restricted importations of certain materials. The British works had now rapidly overcome their back orders, so much so that they were able to quote for immediate delivery. Lower prices were being quoted, consequent on cheaper coal combined with pressure from low-wage Continental countries. The principal improvement made during the year was the electrification of the 8-in. mill, whilst the construction of an additional furnace in the open hearth department and a second open hearth furnace at the steel foundry was also commenced. The following figures show the output compared with the 1925-1926 figures, which are given in brackets:—*Fig.* iron, 343,801 tons (333,025 tons); steel ingots, 353,682 tons, including foundry open hearth furnace (323,518 tons); coke, 350,865 tons (326,127 tons); sulphate of ammonia, 4962 tons (4883 tons). The output of ore from the Broken Hill mine during 1926-27 amounted to 178,887 tons, the highest since 1917, when the output was 214,198 tons. The net profit for the year under review was £291,577, after allowing a total depreciation of £318,979. The increased output at Broken Hill, with improved metallurgical results, have been a valuable offset to the decline in price of lead and silver as compared with the previous period. Since the close of the year the metals have continued to fall very rapidly, making it increasingly difficult to carry on at present prices.

DOMINION TAR AND CHEMICAL CO., LTD.

An interim dividend has been declared for 1927 of $5\frac{1}{2}\%$ (subject to tax at 2s. 6d.) on the ordinary shares, being the same as for last year.

EASTWOODS, LTD.

The seventh ordinary general meeting was held on September 8, Sir T. Cato Worsfold, Bt., LL.D. (chairman), presiding. In spite of the general strike and the coal strike, the company were again able to report increased turnover and profits. The net profits amounted to £95,905, compared with £92,124 for last year. The sum of £20,000 was placed to general reserve, and £1000 allocated to the staff pensions fund. A final dividend was declared on the ordinary shares of $12\frac{1}{2}\%$, making 20% for the year, compared with $17\frac{1}{2}\%$ for 1926. The turnover had increased by 87% since the reorganisation of the company. The cement works at Barrington were now working, and one kiln was producing the best British Portland cement on the basis of 50,000 to 60,000 tons per annum. When the second kiln operates this will be doubled. A subsidiary company had been formed called Eastwoods Flettons, Ltd. The installation of the Vickers-Petters and Marshall oil engines at Yaxley and Fletton had fully justified expectations in securing economical working.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS.

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£8 15s. per ton. f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barites.—£3 10s.—£6 15s. per ton, according to quality.
 Calcium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—2s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 10s.—£10 per ton. Good demand. Grey, £14 10s.—£15 per ton. Liquor, 9d per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—7½d.—8½d. per lb. Crude 60's, 2s. 6d.—2s. 7d. per gal.
 Acid Cresylic, 99/100.—2s. 9d.—2s. 10d. per gal. 97/99.—2s. 4d.—2s. 5d. per gal. Pale, 95%, 2s. 2d.—2s. 3d. per gal. Dark, 90%, 1s. 9d.—1s. 10d.; 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 9d. per gal. Pure, 1s. 6d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 2s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/100, 9½d.—10d. per gal. Solvent 95/100, 1s. 4d.—1s. 5d. per gal. Solvent 90/100, 9½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals.—£11 10s.—£12 per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—84s.—90s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb. 100%.
 Benzaldehyde.—2s. 3d. per lb.
 Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—5½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—2s. 3d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—11d.—1s. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb.
 β-Naphthylamine.—3s. per lb.
 p-Nitraniline.—1s. 8d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 o-Nitraniline.—5s. 9d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb.
 R. Salt.—2s. 2d. per lb.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb.
 p-Toluidine.—2s. 2d. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£30 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 7d.—1s. 8d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 1½d.—1s. per lb. Good demand.
 Acid, Tartaric.—1s. 8d.—2s. 10d. per lb.
 Acid, Tannic.—1s. 3½d. per lb. Less 5%.
 Acid, Tannic.—1s. 3½d. per lb. Less 5%.
 Acid, Tannic.—1s. 3½d. per lb. Less 5%.
 Amidol.—1s. 6d.—1s. 8d. per lb. for quantity.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £30 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—9s. 6d. per oz.
 Barbitone.—5s. 9d.—6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 30 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 2d.—2s. 4d. per lb. Potassium. 1s. 9½d.—2s. per lb. Sodium.—2s.—2s. 2d. per lb.

Granulated ½d. per lb. less. All spot. Large quantities at lower rates.
 Calcium Lactate.—1s. 2d.—1s. 4d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate. 6s. per lb.
 Ethers: S.G. 730, 1s. 1½d.—10½d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—4s. 9d.—5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochloride.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols. 2s. 3d. per gal. In carboys: Winchesters, 2s. 11d.—3s. 9d. per gal.; 20 vols., 4s. 3d. per gal.; Winchesters, 5s.—6s. 6d. per gal. Special prices for larger quantities.
 Hydroquinone.—2s. 11d.—3s. 2d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perochloride.—20s.—22s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £82 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 10d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 5d.—1s. 9d. per lb.
 Methyl Sulphonate.—8s. 9d.—9s. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 1d.—1s. 4d. per lb.
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein.—6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferrioyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic, £15 5s. per ton, d/d. consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 7½d.—1s. 9d. per lb. Crystal, 1s. 8½d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonol.—6s. 9d.—7s. per lb.

Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (ex Anethole).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. **Amyl Butyrate.**—5s. 2d. per lb.

Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. **Benzyl Alcohol free from Chlorine.**—2s. per lb.

Benzaldehyde free from Chlorine.—2s. 6d. per lb. **Benzyl**

Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 3d. per lb.

Coumarin.—9s. 9d. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. per lb. **Geraniol (Palmarosa).**—18s. 6d. per lb. **Geraniol.**—6s. 6d.—10s. per lb. **Heliotropine.**—

4s. 9d. per lb. **Iso Eugenol.**—13s. 6d. per lb. **Linalol.**—

(ex *Bois de Rose*) 16s. per lb. (ex *Shui Oil*) 10s. 6d. per lb.

Linalyl Acetate.—(ex *Bois de Rose*) 18s. 6d. per lb.—

(ex *Shui Oil*) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. **Safrol.**—1s. 6d. per lb. **Terpineol.**

—1s. 8d. per lb. **Vanillin.**—17s. 9d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. **Anise.**—3s. per lb. **Bergamot.**—28s. per lb. **Bourbon Geranium.**—14s. 6d. per lb.

Camphor.—75s. per cwt. **Cananga, Java.** 18s. per lb.

Cassia, 80/85%.—7s. 6d. per lb. **Cinnamon, Leaf.**—6d.

per oz. **Citronella.**—Java, 1s. 10d. per lb., c.i.f.

U.K. port, for shipment over 1928. 1s. 7½d. prompt

shipment from Java. **Ceylon, Pure.** 1s. 8d. per lb.

Clove, pure.—5s. 6d. per lb.

Eucalyptus, Australian.—2s. 3d. per lb. **Lavender.**—Mont

Blanc 38/40%. 17s. 6d. per lb. **Lemon.**—8s. per lb. **Lemon-**

grass.—4s. 6d. per lb. **Orange, Sweet.**—11s. 3d. per lb.

Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s.

per oz. **Palma Rosa.**—10s. 6d. per lb. **Peppermint.**—

Wayne County, 16s. 9d. per lb. **Japanese, 8s.** 3d. per lb.

Petitgrain.—7s. 9d. per lb. **Sandalwood.**—Mysore,

26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Nov. 22nd. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Oct. 6th. Complete Specifications marked are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Adam. Apparatus for treating gases with liquids etc. 24,080. Sept. 13.

Addicks. Disintegrating-machine. 24,000. Sept. 12. **A.-G. Brown, Boveri, et Cie.** Furnaces. 24,010. Sept. 12. (Ger., 10.9.26.)

Bennett. Centrifugal apparatus for spreading etc. liquids etc. 24,486. Sept. 17.

Bossini and Maiuri. Absorption refrigerating-apparatus etc. 24,161. Sept. 14.

Broadbent, and Broadbent & Sons, Ltd. Centrifugal machines. 24,053. Sept. 13. Electrically-driven machines. 24,054. Sept. 13.

Cambridge Instrument Co., Ltd., and Orchard. 24,221. See XI.

Haldenby. Grinding-apparatus. 24,508. Sept. 17.

I.-G. Farbenind. Supports for manufacture of sheets of material soluble in organic solvents. 24,103. Sept. 13. (Ger., 9.4.27.)

Johnson (I.-G. Farbenind.). Apparatus for continuous separation of liquid mixtures. 23,953. Sept. 12. Recovery of volatile organic solvents. 23,961. Sept. 12.

Johnstone and Keith. Apparatus for drying material. 23,097. Sept. 13.

Rutt. Devices for radiation of heat etc. 24,511. Sept. 17. Devices for drying material etc. 24,515. Sept. 17.

Vessels for boiling etc. liquids etc. 24,516. Sept. 17.

Staines. Filter for liquids. 24,084. Sept. 13.

Tupper. Means for mixing liquids. 24,308. Sept. 15.

Wade. Prevention of smoke in furnaces. 23,885. Sept. 12.

I.—Complete Specifications

9582 (1926). **Johnson (I.-G. Farbenind. A.-G.).** Manufacture of finely-divided solid materials. (277,048.)

14,373 (1926). **Wecker.** Separating substances of dissimilar volatilities. (277,085.)

21,716 (1926). **Tintometer, Ltd., Lovibond, and Fawcett.** Colour-estimating apparatus. (277,166.)

25,596 (1926). **Ramsay, and Mayhew, Ramsay & Co., Ltd.** Grinding, milling, and pulverising apparatus. (277,185.)

1544 (1927). **Stattliche Porzellan-Manufaktur.** Suction filters. (264,838.)

7213 (1927). **Allis-Chalmers Manufacturing Co.** Crushers. (269,866.)

23,400 (1927). **Johnson (I.-G. Farbenind. A.-G.).** Manufacture of aqueous solutions or emulsions of solvents or other liquids or solids insoluble in water. (277,277.)

II.—Applications

Arnold (Standard Development Co.). Cracking hydrocarbon oil. 23,974. Sept. 12. Treatment of heavy hydrocarbon oil. 24,210. Sept. 14.

Clayton, Fry, Harper, and Williams. Production of activated carbon. 24,081. Sept. 13.

Ges. für Linde's Eismaschinen A.-G. Separating benzol from gases. 23,991. Sept. 12. (Ger., 13.9.26.)

I.-G. Farbenind. Manufacture of motor fuels. 24,120. Sept. 13.

Johnson (I.-G. Farbenind.). Manufacture of hydrocarbons. 23,955. Sept. 12. Lubricating oils. 23,965. Sept. 12.

Apparatus for catalytic conversion of hydrocarbons. 24,322. Sept. 15. **Hardening paraffins etc.** 24,323. Sept. 15.

Decolorising montan wax. 24,324. Sept. 15. **Carrying out exothermic gas reactions.** 24,326. Sept. 15.

Production of liquid etc. hydrocarbons etc. 24,534. Sept. 17.

King, Morris, Schiff, and Wilder. Separation of gases etc. 24,307. Sept. 15.

King, Lander, and Sinnatt. Treatment of coal etc. 24,518—9. Sept. 17.

Mitchell. Distillation of petroleum etc. 24,214. Sept. 14. **Soc. Anon d'Ougrée-Marhaye.** Treatment of coal etc. 24,416. Sept. 16. (Fr., 9.8.27.)

Steel Bros. & Co., Ltd., and Ward. Distillation of petroleum etc. 24,214. Sept. 14.

Tolman. Treating hydrocarbons. 24,542. Sept. 17.
Trent Process Corp. Dissolving coal. 23,992. Sept. 12.
(U.S., 14.9.26.) Treating coal etc. 23,993. Sept. 12.
(U.S., 14.9.26.)

Wigan Coal & Iron Co., Ltd., and Leek. Treating coal etc. 24,403. Sept. 16.

II.—Complete Specifications

20,472 (1925.) Henshaw, Watson, and Holmes & Co., Ltd. Treatment of gases by the employment of solid catalytic and other reactive agents. (276,736.)

6629 (1926.) Schultz. Preparation and recovery of light oil or motor fuel from crude mineral or shale oil, or tar oils, or from carbonaceous materials. (277,042.)

14,300 (1926.) Low-Temperature Carbonisation, Ltd., and Parker. Retorts for the distillation of coal etc. (277,079.)

15,269 (1926.) Barralet. Manufacture of carbon granules. (277,129.)

15,434 (1926.) Darco Sales Corp. Reactivating decolorising-agents. (269,469.)

19,303 (1926.) Still (Still). Eliminating sulphuretted hydrogen from gases. (271,805.)

25,626 (1926.) Carpmaci (Soc. Ital. per la Metallizzazione). Producing oxyacetylene mixtures for use in spraying metals etc. (277,186.)

31,489 (1926.) Foersterling. Manufacture of air gas. (277,206.)

672 -3 (1927.) Hobson. Distilling solid fuel. (277,214- 5.)

12,642 (1927.) Mathys (Tar & Petroleum Process Co.). Coke ovens (277,256.)

13,855 (1927.) Aktiebolaget Separator. Centrifuges for the purification of oil etc. (271,526.)

19,279 (1927.) I.-G. Farbenind. A.-G. Production of liquid hydrocarbons and derivatives thereof from coal, tar, etc. (277,273.)

*31,832 (1926.) Ateliers Hanrez Soc. Anon., and Modave. Apparatus for the removal of dust from gases. (277,281.)

*10,476 (1927.) Tormin. Manufacture of coke. (277,290.)

*12,919 (1927.) Pistorius and Bunge. Splitting coal into its constituents. (277,293.)

*21,809 (1927.) Aktiebolaget Separator. Recovering oil from fatty solutions of proteins and glues in water. (277,311.)

*23,381 (1927.) Avenarius Gebr. Prevention of knocking of motor fuel. (277,326.)

*23,715 (1927.) Kirschner. See XX.

*23,991 (1927.) Ges. für Linde's Eismaschinen. A.-G. Separating benzol from the gases evolved during the making of coke. (277,378.)

III.—Applications

Brown and Eddington. Tar-removing composition. 24,258. Sept. 14.

Ges. für Linde's Eismaschinen A.-G. 23,991. See II.

III.—Complete Specifications

6629 (1926.) Schultz. See II.

19,279 (1927.) I.-G. Farbenind. A.-G. See II.

*23,991 (1927.) Ges. für Linde's Eismaschinen A.-G. See II.

IV.—Applications

I.-G. Farbenind. Manufacture of pigment dyes. 23,944. Sept. 12. (Ger., 11.9.26.) Manufacture of 1-methyl-2 : 5 : 6-trichloro-3-aminobenzene-4-sulphonic acid. 23,945. Sept. 12. (Ger., 11.9.26.) Manufacture of benzanthrone carboxylic acids. 24,216. Sept. 14. (Ger., 20.9.26.) Manufacture of dyestuffs. 24,442. Sept. 16. (Ger., 23.12.26.)

Johnson (I.-G. Farbenind.). Dyestuffs. 23,956 and 23,958. Sept. 12. Manufacture of chromium stuffs. 24,330. Sept. 15.

IV.—Complete Specifications

14,670 -1 (1926.) I.-G. Farbenind. A.-G., Schmidt, and Berliner. Manufacture of anthraquinone derivatives. (277,109—10.)

14,982 (1926.) Holliday & Co., Ltd., and Shaw. Production of grey to black vat dyestuffs. (277,125.)

15,038 (1926.) I.-G. Farbenind. A.-G. Preparing benzanthrone derivatives. (254,294.)

21,790 (1927.) Johnson (I.-G. Farbenind. A.-G.). Manufacture of finely-divided azo colouring-matter or lakes thereof. (277,275.)

*23,944 (1927.) I.-G. Farbenind. A.-G. Manufacture of pigment dyes. (277,371.)

*23,945 (1927.) I.-G. Farbenind. A.-G. Manufacture of 1-methyl-2 : 5 : 6-trichloro-3-aminobenzene-4-sulphonic acid. (277,372.)

*23,529 (1927.) I.-G. Farbenind. A.-G. Manufacture of benzanthrone and intermediate products. (277,342.)

V.—Applications

British Celanese, Ltd., Ellis, Olpin, and Walker. Treatment of fabrics. 23,923. Sept. 12.

Dreyfus. Manufacture of cellulose derivatives. 24,123—4. Sept. 13.

Gull. Manufacture of artificial silk. 24,237. Sept. 14.

Hercules Powder Co. Treating nitrocellulose. 24,541. Sept. 17. (U.S., 24.5.27.)

I.-G. Farbenind. Treatment of hydrated cellulose. 24,102. Sept. 13. (Ger., 5.10.26.) Manufacture of amino-cellulose derivatives. 24,215. Sept. 14. (Ger., 30.10.26.)

Johnson. 24,329. See XIII.

Quasi Arc Co., Ltd., and Strohmeier. 24,348. See XI.

Soc. pour la Fabr. de la Soie Rhodaneta. Manufacture of artificial silk. 24,242. Sept. 14. (Fr., 14.4.27.)

Teague. Production of plastic products. 24,117. Sept. 13.

Waddell and Watson. Treating fibre-bearing plants. 24,163. Sept. 14. Treating flax for spinning. 24,503. Sept. 17.

V.—Complete Specifications

14,416 (1926.) Silver Springs Bleaching & Dyeing Co., Ltd., and Hall. See VI.

20,939 (1926.) Valet. See XVII.

328 (1927.) Groves (Borne Strymser Co.). Conditioning textile fibres. (277,213.)

4239 (1927.) Soc. Civile des Proc. Masse. Treating green or dry stalks of ramie and other vegetable fibres. (266,344.)

*21,314 (1927.) Wolff & Co., Czappek, and Weingand. Production of foils, films, bands, etc. from viscose. (277,309.)

*22,656 (1927.) I.-G. Farbenind. A.-G. Manufacture of sulphonated cellulose derivatives. (277,317.)

VI.—Applications

British Celanese, Ltd., Ellis, Olpin, and Walker. 23,923. See V.

I.-G. Farbenind. 24,102. See V.

Johnson (I.-G. Farbenind.). Printing on textile fabrics. 24,196. Sept. 14. Production of impregnating compositions. 24,535. Sept. 17.

VI.—Complete Specifications

14,416 (1926.) Silver Springs Bleaching & Dyeing Co., Ltd., and Hall. Rendering cellulose acetate silk and similar products resistant to deterioration. (277,089.)

21,716 (1926.) Tintometer, Ltd., Lovibond, and Fawcett. See I.

25,151 (1926.) Milne. Drying, calendering, and like machines. (277,181.)

*22,790 (1927.) Ratinier. Printing fabrics in several colours. (277,320.)

VII.—Applications

Fairweather (Selden Co.). Catalytically oxidising sulphur dioxide. 24,211. Sept. 14. Preparation of vanadic acid. 24,236. Sept. 14.

Johnson (I.-G. Farbenind.). Production of ammonia from its elements. 24,327. Sept. 15. Production of moulded silica gels. 24,537. Sept. 17.

King, Morris, Schiff, and Wilder. 24,307. *See* II.
 Soc. Chim. des Usines du Rhône. Protection of apparatus against acids. 24,340. Sept. 15. (Ger., 4.2.27.)
 Zelewski. Manufacture of sulphuric acid. 24,121. Sept. 13. (Ger., 13.9.26.)

VII.—Complete Specifications

14,333 (1926). Engol. Base-exchange silicates, and process of making same. (277,082.)
 8741 (1927). Gerlach. Cells with quicksilver cathodes for the decomposition of alkali chlorides. (269,513.)
 *23,311 (1927). Hornsey. Reducing oxides of metals. (277,325.)
 *24,121 (1927). Zelewski. Producing gas-currents for the manufacture of sulphuric acid. (277,382.)

VIII. Complete Specification

69 (1927). Pétrole Synthétique Soc. Anon., and Folliet. *See* X.

IX.—Applications

Fawcett, and Fawcett, Ltd. Manufacture of bricks etc. 24,174. Sept. 14.
 Johnson (I.-G. Farbenind.). Production of plasters etc. 23,959, 23,960, and 23,962. Sept. 12.
 Scottish Dyes, Ltd., Beckett, Thomas, and White. Employment of cement etc. 23,998. Sept. 12.
 Teague. 24,117. *See* V.

X.—Applications

Billington. Copper alloys. 23,996. Sept. 12.
 Coley. Reduction of ores etc. 24,253. Sept. 14.
 Evans and Hamilton. Manufacture of iron etc. alloys. 24,276. Sept. 15.
 Garnett, Holden, and Smith. Magnetic alloys. 24,459. Sept. 16.
 Metallisation Ltd., and Cozens. Coating materials by metal spraying. 24,543. Sept. 17.
 Sulman and Picard. Extraction of tin etc. from ores etc. 24,138. Sept. 13.
 Taylor. Tinning flexible metal strips etc. 24,353. Sept. 15.

X.—Complete Specifications

14,210 (1926). Cozens, and Metallisation, Ltd. Coating of materials by metal-spraying. (277,071.)
 15,188 (1926). Adam. Detinning of tinned iron scrap etc. (277,127.)
 19,286 (1926). Spies. Granulating molten slag. (277,154.)
 22,308 (1926). Kelly. Alloys. (277,170.)
 25,026 (1926). Carpmel (Soc. Ital. per la Metallizzazione). *See* II.

29,499 (1926). Yoshikawa. Lead alloys. (277,199.)
 32,581 (1926). Davies. *See* XI.
 69 (1927). Pétrole Synthétique Soc. Anon., and Folliet. Producing a refractory coating on metallic surfaces. (277,211.)

11,115 (1927). Dowson & Mason Gas Plant Co., Ltd., and Paton. Gas-fired annealing-furnaces. (277,251.)
 12,665 (1927). Michel. Metallurgy of readily-oxidisable metals, e.g., magnesium. (271,088.)

*16,876 (1927). Metals Protection Corp. *See* XI.
 *21,286 (1927). Soc. Anon. des Acieries et Forges de Firminy. Protection of metals in the cementation process. (277,307.)

*21,302 (1927). Vogel. Pickling of iron etc. (277,308.)
 *23,311 (1927). Hornsey. *See* VII.

XI.—Applications

Cambridge Instrument Co., Ltd., and Orchard. Thermoelectric pyrometers. 24,221. Sept. 14.
 Garnett, Holden, and Smith. 24,459. *See* X.
 Lederer. Manufacture of electron-emitting bodies. 23,978. Sept. 12. (Austria, 12.4.27.)
 Matthewson. Production of Röntgen rays etc. 24,300. Sept. 15.

Mond (Berndorfer Metallwarenfabr. A. Krupp A.-G.). Producing galvanic coatings. 24,244. Sept. 14.

N. V. Philips' Gloeilampenfabr. Manufacture of electric incandescence lamps etc. 24,555. Sept. 17. (Fr., 18.9.26.)
 Oldham & Son, Ltd., and Wilde. Galvanic batteries. 24,140. Sept. 13.

Quasi Arc Co., Ltd., and Strohmenger. Fusible electrodes for electric arc welding. 24,348. Sept. 15.

XI.—Complete Specifications

32,581 (1926). Davies. *See* X.
 7724 (1927). Anode Rubber Co., Ltd. *See* XIV.
 8741 (1927). Gerlach. *See* VII.
 *16,876 (1927). Metals Protection Corp. Chromium plating. (277,295.)
 *23,647 (1927). Siemens & Halske A.-G. Induction furnaces or heating-devices. (277,352.)
 *23,784 (1927). Siemens & Halske A.-G. High-frequency induction furnaces. (277,361.)

XII.—Applications

Bailey and Bailey. Soap. 23,995. Sept. 12.
 Hulse. Detergent composition. 24,489. Sept. 17.

XII.—Complete Specification

15,572 (1926). Reebberg Ges. Reducing auto-oxidation of oils and fats. (254,303.)

XIII. Applications

Barash. Manufacture of substance for use as paint etc. 24,504. Sept. 17.
 Carbide & Carbon Chemicals Corp. Paint etc. removers. 24,008. 9. Sept. 12. (U.S., 26.2.27.)
 I.-G. Farbenind. 23,944. *See* IV.
 Johnson (I.-G. Farbenind.). Application of condensation products of aldehydes. 24,199. Sept. 14. Non-inflammable nitrocellulose lacquers. 24,329. Sept. 15.

XIII.—Complete Specifications

14,337 (1926). Gerlach. Manufacture of pigments and impregnating compounds etc. (277,083.)
 30,471 (1926). Wolff & Co., and Schulz. Applying coatings of nitrocellulose lacquers. (262,440.)
 1399 (1927). I.-G. Farbenind. A.-G. Manufacture of condensation products of aldehydes with ketones. (264,830.)
 21,790 (1927). Johnson (I.-G. Farbenind. A.-G.). *See* IV.
 *23,944 (1927). I.-G. Farbenind. A.-G. *See* IV.

XIV.—Applications

Bacr. Process for making an elastic caoutchouc-like body. 24,457. Sept. 16. (Switz., 20.10.26.)
 Head. Rubber solvent. 24,296. Sept. 15.
 Johnson (I.-G. Farbenind.). Manufacture of artificial rubber. 23,963. Sept. 12. Production of raw rubber from latex. 24,328. Sept. 15. 
 K. D. P., Ltd. Drying mixings of latex and filling-materials. 23,968. Sept. 12. (Ger., 10.9.26.) Production of rubber mixings. 23,969. Sept. 12. (Ger., 10.9.26.)

XIV.—Complete Specifications

28,344 (1926). Biddle. Caoutchouc-latex compositions. (277,194.)
 7724 (1927). Anode Rubber Co., Ltd. Manufacture of rubber goods from rubber dispersions by electrophoretic means. (269,505.)
 *23,440 (1927). Goodyear Tire & Rubber Co. *See* XX.
 *23,968 (1927). K. D. P., Ltd. Drying of mixings of latex and filling-materials. (277,373.)
 *23,969 (1927). K. D. P., Ltd. Production of rubber mixings from latex and filling-materials. (277,374.)

XV.—Application

Johnson (I.-G. Farbenind.). Shoe polishes etc. 23,952. Sept. 12.

XV.—Complete Specifications

*21,809 (1927). Aktiebolaget Separator. *See* II.

*23,616 (1927). Maschinenfabr. Turner A.-G. Treating hides, skins, and leathers. (277,319.)

XVI. Applications

Bloxam (Jones) Disinfecting seeds. 24,213. Sept. 11.
Johnson (I. G. Farbennid.) Fertilisers. 23,954. Sept. 12.
24,196. See XIX. Fertilisers. 24,325. Sept. 15.

XVII.—Application

Salerii. 24,462. See XIX.

XVII. Complete Specification

20,939 (1926) Valot. Extracting pulcellu bagasse of sugar cane. (277,163.)

XIX. Applications

Johnson (I. G. Farbennid.). Treatment of vegetable material. 24,194. Sept. 11.

Nyrop. Manufacture of chocolate. 24,222. Sept. 11.

Salerii. Manufacture of sweetmeats. 24,462. Sept. 16.

XX. Applications

Boehringer, and Boehringer Sohn. Extraction of bromine. 23,920. Sept. 12.

I. G. Farbennid. and Henrich. Manufacture of α -amino-alkylammonaphthalene-carboxylic acid. 23,982. Sept. 12.

Johnson (I. G. Farbennid.) Sulphonic acid. 23,964. Sept. 12. Production of sulphonic acids. 24,197. Sept. 11. Production of polyvalent alcohols. 24,198. Sept. 14. Process for vapourising formamide. 24,536. Sept. 17.

Jones and Jones. Remedy for consumption. 23,910. Sept. 12.

XX. Complete Specifications

25,685 (1925) Ayres and Haabestad. Substituting hydroxyl groups for the acid radicals in liquid esters of monoamic acids or for halogens in liquid derivatives of hydrocarbons. (241,889.)

14,477 (1926) Carpuat (I. G. Farbennid. A. G.) Manufacture of new aralkyl-ethers which are aralkylated in the nucleus, and of their sulphonic acids. (277,098.)

14,673 (1926) Carpuat (I. G. Farbennid. A. G.) Converting difficultly soluble or insoluble colloidal carbohydrate ethers into soluble products. (277,111.)

14,211 (1927) Comp. de Béthune. Preparation of ethyl-sulphuric acid. (273,263.)

*708 (1927) Newport Co. Manufacture of 3,4-diamino-benzoylbenzoic acids. (277,285.)

*20,727 (1927) Chem. Fabr. and Actien (vorm. E. Schering). Obtaining germ gland hormones from vegetable organisms. (277,302.)

*23,110 (1927) Goodyear Tire & Rubber Co. Preparing dithioazyl disulphide. (277,338.)

*23,715 (1927) Kirschner. Production of mixtures of mineral oil products and aliphatic alcohols. (277,357.)

XXI. Applications

Colbrook. Treating photographic films. 24,152. Sept. 11.
Johnson (I. G. Farbennid.). Carrying out photochemical reactions. 23,957. Sept. 12.

XXI. Complete Specification

*17,402 (1927) I. G. Farbennid. A. G. Photographic films. (277,297.)

XXII.—Application

Hercules Powder Co. 24,544. See V.

XXII.—Complete Specification

14,333 (1926) Engel. See VII.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods.

British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Paper (B.X. 3816). *British India*: Leather belting, chemicals (237). *Chile*: Soya bean oil, steel sheets (251). *Czechoslovakia*: Chemicals for technical purposes (239). *India Burma and Ceylon*: Druggists' sundries, photographic materials (238). *Italy*: Salt cake, ammonium sulphate, copper sulphate, nickel sulphate, carboic acid crystals, ammonium carbonate, prussiates of soda and potash, shellac (241). *Turkey*: Galvanised sheets (tinplate) (247–248). *United States*: Hollow brass balls (B.X. 3817).

Safeguarding of Key Industries

The Board of Trade give notice that representations have been made to them under Section 10 (5) of the Finance Act, 1926, for the exemption from the duty imposed by the Safeguarding of Industries Act, as amended by the Finance Act, 1926, of the following articles: Bromural (Monobromisovalerylurea), Eukodal (Dihydro-codemone hydrochlorate), Papaverine, R. Potassium permanganate, Resorcine, and Styraeol (Guaiacol cinnamate). Communications relating to the above-mentioned applications should be addressed to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, S.W.1, before October 21.

News from Advertisements

A technical assistant is required by a chemical engineer (p. vi).

A chemical engineer is required for a large factory in the Midlands (p. vi).

A highly trained chemist requires a junior partnership in a chemical concern (p. vi).

A chemist's business in South London is for sale (p. vi).

Sets of this JOURNAL etc. are for disposal (p. vi).

A mixer is required (p. vi).

A technical assistant is required for the patent department of a large manufacturing firm (p. vi).

A platinum basin is for sale (p. vi).

There are 117 firms represented under various headings in our Buyers' Guide.

No. 40

EDITORIAL

International Understandings

ACCORDING to the newspapers there are very important negotiations pending or even completed in which the English, French and German chemical manufacturers are concerned. Whether authentic information about these will be available by the time we go to press we do not know, but we do know that in connexion with certain developments arrangements have been completed, and this shows that there is no insuperable obstacle to such a course of procedure. Historians may look to the past, industrialists must look to the future. There is hardly anything which strengthens friendship so much as community of interest, and we have often in these columns, expressed our belief that the prosperity of Europe will be greatly advanced if industrialists will work together for their common advantage instead of trying to increase their individual productions beyond the needs of the world and in this way increase their overhead charges and decrease their profits as they have done in the past. In some industries it is possible that small units may yet be profitable; in the chemical industry this is hardly so, almost every chemical operation on the large scale implies the manufacture of by-products and the utilisation of these in some other process. Your process must therefore expand horizontally, and to ensure the supply of raw materials the process must often expand vertically. In the particular case a number of us, English, French and German, recently visited several works in France and Germany, and we feel sure that the feeling of the English members of the party, who were guests of our German and French friends, is one of the most cordial gratitude. We were hospitably received, sumptuously entertained, and if anything could be done to interest and please us, it was done. Those who know the country which lies between Frankfurt, Wiesbaden, Coblenz and Cologne may imagine the fascination of visiting works in that district and of having our refreshment in Rudesheim and other places whose products are familiar names. The town of Leverkusen provided, in addition, other features of interest. We have never seen a works of such magnitude as Leverkusen, nor a works in which so many of the triumphs of modern

chemistry and modern engineering could be seen. The greatest and most up to date of our chemical works in this country are not always very easy to see. At Leverkusen we were shown processes and plant which no doubt are a legitimate source of pride to Germany and were the objects of our admiration, and we were able to see everything, not as if we were dangerous competitors, but as colleagues. If this friendly spirit of co-operation is to be a feature of the European chemical manufacturers, if we can pool our knowledge and experience, eliminate waste and inefficient processes, then indeed this great industry will attain to a measure of prosperity and of service to mankind far beyond anything that has yet been achieved. The chemical industry of the future will probably include the fuel industry, metallurgy, the manufacture of artificial silk and of many drugs and foods which are as yet unknown. It is an industry which should dispense with artificial barriers, or at least cut them down to the lowest possible. The three nations we have mentioned have now an opportunity of replacing bitterness by friendship, and of being so busy with the success of industrial developments that they have no time to dwell on the misfortunes of the past. Whether this comes about or not, we are satisfied that the English participants in this visit will long have the most pleasant recollections of the many beautiful places they saw in the valleys of the Seine and the Rhine and of the phenomenal efficiency and scientific achievement of Leverkusen. We do not wish our readers to infer that the co-operation between the manufacturers concerned was confined to motor trips through districts replete with forests and castles and to luncheons and dinners, after which we spoke of our own self-satisfaction and the admiration we had for the others; the co-operation has taken the form of financial participation. Leverkusen begun as a small ultramarine works; it now covers an area of more than a square mile. A visit to it provides opportunity for much thought. From small beginnings great things may grow; when Dr. Duisberg sketched in his mind, about twenty years ago, the possibilities of Leverkusen, he had sufficient imagination and faith to place some of his buildings nearly a mile apart. He and his colleagues have by now pretty well filled the intervening spaces.

The Industrial Chemist

Judging from the letters which have appeared in our columns recently, there are many who think that the chemist produced by our universities is not all that he might be. Some of the critics blame the chemist himself for his shortcomings; others blame the teachers responsible for his university training; whilst an occasional original spirit raises his voice in criticism of the manufacturer and his management. After reading "The Making of a Chemical," by E. I. Lewis and G. King, reviewed elsewhere in our columns, we are not altogether surprised that the average chemist sometimes fails to reach the high level expected from him. There is so much to learn!

No one will deny that the industrial chemist of the dreams of Messrs. Lewis and King would satisfy the critics, but the question arises, "How is the state of excellence to be attained?" It is obvious, in the first place, that salvation cannot come entirely from within, even with the aid of such works as "The Making of a Chemical." Of course, there will always be a few supermen who will rise superior both to teachers and environment, but in most cases the young chemist is but so much plastic raw material, firstly in the hands of his professors and later in those of his industrial teachers—the manufacturer and his management.

We are all familiar with the criticisms levelled at the teachers of chemistry in our universities, namely, the tendency to specialise by concentrating on the theoretical rather than the practical or by emphasising modern ideas and discovery at the expense of the older fundamentals. We do not think that the effect of this is always as serious as is usually supposed, providing that it stimulates inquiry and assists in the development of the student's power of thought and reasoning. A well trained brain is the first thing to be aimed at; as Messrs. Lewis and King point out, with the normal man, the necessary facts have a habit of accumulating of their own accord. Nevertheless, teachers might do more to cultivate in the mind of the student a sense of proportion and perspective. Much might be done in this direction, we think, by a better training in the use of the literature of chemistry. Often as a result of teaching based largely on the selected facts of textbooks, supplemented by disordered reading of modern literature, the student's sense of proportion and perspective is warped. He is inclined to believe that all chemical progress is in the present, whilst most of the great names of our science are to him mere labels attached to some "reaction," "hypothesis," or "principle," rather than those of men who have lived, experimented, erred and triumphed.

Many chemists passing into industry know but little about the original literature, the use of which might be of such great assistance. We realise that it is not always easy to teach the use of the literature during a degree course, but too often the short period of research which follows is frittered away on some more or less unimportant piece of "research" in which the student fills the role of a mere manipulator. The subject and the method of attack are usually suggested by the professor, who also, as often as not, even carries out the preliminary reading. We have often thought that

this period might be made so much more profitable if the student were made to read up and collect data on certain chosen subjects of wide interest and then to plan a number of researches rather than to carry out one small piece of work under the conditions described above. Such a procedure would familiarise him with the journals and works of reference, and would do much to broaden his outlook. To his surprise he would find that many of his problems could be half solved without a single experiment on his part, and a weapon of incalculable value would be added to his armoury.

When we turn to consider those who should be his industrial teachers—the manufacturer and the management—we are on more difficult ground. If we may judge from evidence that has come before us, it seems that few manufacturers realise how much they are responsible for making the industrial chemist what he is. If the chemist is to fulfil his highest functions in industry he must be afforded opportunity of acquiring the necessary knowledge after he leaves college. That he should have access to a good library goes without saying; he should also have the opportunity to use it properly. Too often the manufacturer does not realise that the chemist is working unless he is actively engaged amongst his test tubes and beakers, and looks askance at the chemist who is merely reading. He often forgets that in engaging a chemist he is hiring brains rather than hands.

A university training should have endowed the chemist with a trained mind and a keen brain prepared to tackle almost any problem connected with the running of a chemical works, yet the practice in many organisations is for the individual chemist to be presented with an individual problem and left to it. As to other problems, chemical or otherwise, occupying the minds of the management, he usually knows nothing. Yet a brain that has been trained to deal with chemical problems could often contribute something of value to the solution of those of management, marketing and salesmanship. It is acknowledged that relatively few chemists pass into management. The reason for this is partly, no doubt, their very enthusiasm for their own subject, which cuts them off from the more general problems of industry, where their brains might be equally useful. It seems, however, that managements might do much more to utilise the brains at their disposal. Boards of directors meet frequently to struggle bravely with unfamiliar subjects, under the guidance of managing directors and research directors, but in few works does the management call the chemical staff together to discuss everyone's different problems. In this way the manufacturer is responsible for specialisation, to his own loss, just as much as the academic teachers whom he so often criticises. We are informed that at present in a large number of works the only way in which a chemist can acquire much of the information that Messrs. Lewis and King consider essential for his efficiency is by sheer inquisitiveness, exercised when, in the opinion of the management, he should be amongst his bottles and beakers. Meanwhile, the clerical staff, which is more familiar with the general side of the business, assumes the functions of management which should be in the hands of chemists. What, one wonders, has the manufacturer to say about this?

RECENT DEVELOPMENTS IN THE STUDY OF ACID CATALYSIS*

By Prof. H. M. DAWSON, D.Sc.

The first successful attempt to study the operation of the time factor in chemical change was made in 1850 by Wilhelmy, who showed that the inversion of cane sugar under the catalytic influence of acids proceeds in accordance with a simple law—subsequently recognised as the law of mass action. Since that time the investigation of the many-sided effects which are bound up with the catalysing action of acids has been pursued with uninterrupted vigour. This may be attributed in part to the success which attended the interpretation of the facts in accordance with the general principles which connote the birth of modern physical chemistry, and to the recognition of the technical importance of catalytic phenomena, but more particularly to the circumstance that the acceleration of chemical change has long been accepted as one of the characteristics of that group of substances to which the term acid is applied.

Soon after the advent of the ionic theory, the clearly-marked parallelism between the catalytic power and the electrical conductivity of different acids led to the view that the catalytic effects of acids are attributable to the hydrogen ion, the observed reaction velocity being directly proportional to the concentration of the hydrogen ion. In spite of certain anomalies, *e.g.*, the apparent increase in the catalytic power of the strong acids on the addition of the corresponding salts, for the explanation of which auxiliary hypotheses were introduced, the simple hydron theory of acid catalysis was for many years very generally accepted; this was in large measure justified by the circumstance that the theory served to correlate with a fair degree of precision large groups of experimental observations.

Subsequent and more exact measurements of the speed of acid catalysed reactions gave results which were shown to be incompatible with the simple hydron theory, and at the same time substantial evidence was advanced in support of the view that catalytic activity must be attributed to the un-ionised acids as well as to the hydrogen ion. The facts adduced in support of this dual catalytic action of acids were such as to warrant the belief that the dual theory represented an extension of the simple hydron theory which was essentially correct.

More recently it has been suggested that deviations from the classical hydron theory are due to the circumstance that the catalytic activity of an acid in solution is not determined by the ordinary volume concentration of the hydrogen ion, but by its thermodynamic concentration or "activity." There is, indeed, incontrovertible evidence in support of the view that chemical equilibrium is not directly expressible in terms of the volume concentrations of the substances involved, but that the law of mass action expresses a relation which is only true when the volume concentrations are replaced by the "activities" of the substances concerned.

The connexion between the "activity" a and the volume concentration c is conveniently expressed in

terms of the so-called "activity coefficient" $f = a/c$. The magnitude of this coefficient depends on the environment of the molecules (or ions) concerned, and the connexion between f and c may be derived by various thermodynamic methods.

In so far as the hydrogen ion is concerned, it may be stated quite briefly that its "activity coefficient" in aqueous solution depends very much on its ionic environment, that is to say, on the total number of charged particles (ions) in its vicinity and on the charge which these ions carry. The scope of this paper does not permit of any discussion of the quantitative relations which are involved. It suffices to point out that the introduction of the concept of "activity" and the linking up of this concept with the views of Debye and Hückel relative to interionic effects in solutions of electrolytes are mainly responsible for the most recent attempts to interpret the experimental facts relating to acid catalysis in terms of the "activity" of the hydrogen ion. It may be that the "activity," although introduced as a formal thermodynamic quantity, will ultimately be shown to be connected with the physical condition of the hydrogen ion, in which case there would appear to be very strong grounds for the consideration of the possibility of substituting the volume concentration of the catalytic entity by its "activity" in the analysis of data relating to acid catalysis. Recent developments in the investigation of the phenomena have, however, disclosed facts which would seem to preclude the possibility of any explanation in terms of the hydrogen ion as the only active constituent. On the other hand, these facts suggest very strongly that the catalytic activity of an acid represents an effect in which the hydrogen ion, the acid anion, and the undissociated acid molecule are jointly concerned. The identification of the several catalytically active entities seems, indeed, to be the question of primary importance. Whether the catalytic effects can be more suitably expressed in terms of volume concentrations or the "activities" of these entities is a matter which may ultimately have to be considered, but for the present it has been found more convenient to adopt the former alternative, in support of which, moreover, substantial evidence is afforded by the available experimental data.

In a general way, it may be said that the dominant catalytic entity in aqueous solutions of pure acids is the hydrogen ion. If the corresponding salt is added to a solution of a moderately weak acid, the hydrogen ion concentration is depressed and, under these circumstances, the catalytic effects due to constituents other than the hydrogen ion may be expected to be much more readily observed. It is, indeed, the study of such acid-salt mixtures which has furnished the strongest evidence for the views which are described in this paper. For comparative purposes, such acid-salt mixtures may be grouped in many different ways, but there are two methods of grouping which are of outstanding interest. The first of these methods corresponds with acid-salt mixtures represented by the general formula $cHA + xMA$, in which the concentration of the acid HA is constant, whilst that of the salt MA is varied. Such mixtures may be said to form a constant acid series.

In proceeding to describe experimental results it may

* Based on a paper delivered before Section B.—Chemistry, at the Leeds meeting of the British Association.

be pointed out that the acid catalysed reaction which has been studied in detail by us is the reaction between acetone and iodine. For a given catalyst the velocity of this reaction is proportional to the concentration of the acetone, and is independent of the concentration of the iodine. The latter may, indeed, be regarded as an indicator which serves to measure the rate at which the acetone undergoes some change which is usually considered to be the keto-enol transformation.

The experimental results obtained in the determination of the initial velocity of reaction under the influence of mixtures represented by the formula $0.1 \text{ CH}_3\text{CO}_2\text{H} + x \text{ CH}_3\text{CO}_2\text{Na}$ are shown in Diagram I in which the reaction velocity v is plotted against the salt concentration x . This diagram shows also the

DIAGRAM I.

results which are to be expected on the basis of the classical hydron theory, and of the dual theory. According to the experimental curve, increase in the concentration of the added sodium acetate results at first in a rapid fall in the reaction velocity which, however, reaches a minimum and afterwards increases according to a linear relation which may be expressed by $v = v_m + k_a x$. It may readily be shown that the catalytic effects of the hydrogen ion in solutions for which $x > 0.05$ may be entirely neglected in comparison with the observed velocity of reaction. Since, moreover, the concentration of the undissociated acetic acid is practically constant throughout the series, the linear portion of the $v - x$ curve cannot be explained in terms of the simple hydron theory or in terms of the dual theory.

In accordance with the view that the salt is completely ionised and the fact that the metallic cation has no appreciable catalytic influence, it would seem that the linear portion of the $v - x$ curve is attributable to the catalytic activity of the acetate ion. The slope of this

line by k_a and thus affords a measure

of the velocity coefficient for the acetate ion. If the linear portion of the curve is extrapolated to $x = 0$, it is obvious that the intercept on the ordinate should afford a measure of the velocity which is due to the undissociated acetic acid which is present in constant amount throughout the whole series. This extrapolated velocity $v_m = k_m c = 0.1 k_m$ gives a value for k_m , the velocity coefficient for undissociated acetic acid, which is identical with the value obtained in 1913 by Dawson and Powis (J.C.S., 1913, 103, 2135) in experiments with salt-free solutions of acetic acid of varying concentration. Two independent series of experiments, involving entirely different methods of procedure, thus lead to an identical value for the velocity coefficient of the un-ionised acid.

In accordance with the above interpretation, the observed reaction velocity may be represented as the sum of partial velocities due respectively to the action of the hydrogen ion, the acetate ion and the undissociated acid. In other words

$$v = v_h + v_a + v_m$$

where v_h , v_a and v_m are the respective partial velocities due to the positive ion, the negative ion and the electrically neutral acid molecule.

This equation may be written

$$v = k_h [\text{H}^+] + k_a [\text{A}^-] + k_m [\text{HA}] \quad (1)$$

in which the values of $[\text{H}^+]$, $[\text{A}^-]$ and $[\text{HA}]$ are given by

$$[\text{H}^+] = K(c - [\text{H}^+])/(c + [\text{H}^+]) \quad [\text{A}^-] = x + [\text{H}^+]$$

and $[\text{HA}] = c - [\text{H}^+]$ respectively, K being the ionisation constant of acetic acid $= 1.85 \times 10^{-5}$. The values of the catalytic coefficients at 25°, when referred to an acetone concentration of 20 c.c. per litre, are $k_h = 4.65 \times 10^{-4}$, $k_a = 1.5 \times 10^{-6}$, and $k_m = 1.5 \times 10^{-6}$. The two latter were obtained by the methods already described, and the value of k_h from auto-catalytic experiments in which the observed rate of reaction can be ascribed entirely to the hydrogen ion.

The observed and calculated reaction velocities are compared in Table I (cf. Dawson and Carter, J.C.S., 1926, 2282), the first column of which shows the concentration (c) of the added salt, col. 2 the concentration of the hydrogen ion from which the concentrations of the acetate ion and of the undissociated acetic acid may be derived, cols. 3, 4 and 5 the partial velocities due to the hydrogen ion, the acetate ion and the undissociated acid respectively; col. 6 the total velocity calculated from equation (1); and col. 7 the velocity actually observed.

TABLE I
 Catalyst: 0.1 CH₃CO₂H : 1 CH₃CO₂Na

<i>c</i>	$[\text{H}^+]\cdot 10^3$	$v_h\cdot 10^6$	$v_a\cdot 10^6$	$v_m\cdot 10^6$	$v_{\text{cal}}\cdot 10^6$	$v_{\text{obs}}\cdot 10^6$

1.0	0.02	0.001	4.500	0.150	4.6	4.6

Inspection of the table shows that the observed velocities for this constant acid series of acid-salt mixtures are in satisfactory agreement with the calculated values over the entire range extending from the salt-free solution to that which contains ten times as much salt as acid. At low salt concentrations, the chief catalytic agent is the hydrogen ion, but for salt concentrations between 0.01 and 0.25 moles per litre, the largest effect is due to the undissociated acid, and at still higher salt concentrations the dominant catalytic effect is attributable to the acetate ion. Similar results have been obtained for many other constant acid series of acid salt mixtures.

Symmetry of the v - p_{H} curve and dependence of the iso-catalytic data on the concentration of the acid

If the values of $[\text{A}^-]$ and $[\text{HA}]$ given by $[\text{A}^-] = K(c - [\text{H}^+]) / [\text{H}^+]$ and $[\text{HA}] = c - [\text{H}^+]$ are substituted in equation (1) the latter assumes the form

$$v = (k_h + k_m)[\text{H}^+] + k_a K c / [\text{H}^+] + k_m c + k_a K \quad (2)$$

in which the term $k_a K$ represents a quantity which is very small in comparison with the measured velocities, and may therefore be neglected.

By differentiation of equation (2) which expresses the velocity as a function of the hydrogen ion concentration, it may be shown that the velocity passes through a minimum when

$$[\text{H}^+] = [\text{H}] = \sqrt{k_a K c / (k_h + k_m)} \quad \dots \dots \dots (3)$$

$$\text{and } v = v_1 = 2 \sqrt{(k_h + k_m) k_a K c} + k_m c \quad \dots \dots \dots (4)$$

$$= 2k_h[\text{H}] + k_m c \quad \dots \dots \dots (4a)$$

The acid-salt mixture for which the velocity has a minimum value is of particular significance in that it serves as a basis for the co-ordination of the catalytic data for all other mixtures belonging to the same constant acid series. If the reaction velocity, as expressed by equation (2) is plotted against the logarithm of the hydrogen ion concentration, or against $p_{\text{H}} = -\log_{10}[\text{H}^+]$, we obtain, in fact, a symmetrical curve of catenary type (Dawson and Dean, J.C.S., 1926, 1872), the lowest point of which (referred to as the iso-catalytic point) corresponds with the minimum velocity (M.V.) mixture. It follows from this that the p_{H} value of the M.V. mixture is the arithmetic mean of the p_{H} values for any pair of solutions belonging to the same constant acid series for which the reaction velocities are equal. In other words, such pairs of solutions are catalytically equivalent. This may be shown in the following manner. Let v_1

and v_2 be the reaction velocities for any pair of solutions of the same constant acid series, the corresponding hydron concentrations being $[\text{H}]_1$ and $[\text{H}]_2$; then, according to equation (2) we have

$$v_1 = (k_h + k_m)[\text{H}]_1 + k_a K c / [\text{H}]_1 + k_m c$$

$$\text{and } v_2 = (k_h + k_m)[\text{H}]_2 + k_a K c / [\text{H}]_2 + k_m c$$

If $v_1 = v_2$, then

$$(k_h + k_m)[\text{H}]_1 + k_a K c / [\text{H}]_1 = (k_h + k_m)[\text{H}]_2 + k_a K c / [\text{H}]_2$$

and on rearranging the terms, we obtain

$$[\text{H}]_1 + [\text{H}]_2 = k_a K c / (k_h + k_m) + [\text{H}]_1^2 \quad \dots \dots \dots (5)$$

$$\text{or } (p_{\text{H}})_1 + (p_{\text{H}})_2 = 2(p_{\text{H}})_{\text{M.V.}} \quad \dots \dots \dots (5a)$$

When the observed velocities for solutions belonging to the same constant acid series are plotted against p_{H} and horizontal lines are drawn to intersect the curve, the points of intersection give the p_{H} values $(p_{\text{H}})_1$ and $(p_{\text{H}})_2$ for pairs of catalytically equivalent solutions. Table II shows the results obtained in the case of the series 0.05C(CH₃·CO₂H) : 1C(CH₃·CO₂Na). The arithmetic mean of these is shown in the fourth column and thus, as required by the above theory, is quite constant.

 TABLE II
 p_{H} values of catalytically equivalent solutions

<i>c</i> · 10 ²	$(p_{\text{H}})_1$	$(p_{\text{H}})_2$	$\frac{1}{2}[(p_{\text{H}})_1 + (p_{\text{H}})_2]$
50	3.63	4.43	4.03
60	3.46	4.59	4.025
70	3.36	4.50	4.05
80	3.28	4.78	4.03
90	3.22	4.81	4.01
100	3.16	4.90	4.03
110	3.10	4.96	4.03
120	3.04	5.01	4.025

According to equations (3) and (4), the iso-catalytic data $[\text{H}]_1$ and v_1 for a constant acid series of acid-salt mixtures depend on the concentration of the acid which is characteristic of the series. Observations made with different series (cf. Dawson and Hoskins, J.C.S., 1926, 3166) in which the concentration of the acetic acid was varied from 0.01 to 1.0 moles per litre have yielded values of $[\text{H}]_1$ and v_1 which are in close agreement with those calculated from equations (3) and (4). Table III affords a comparison of the observed and calculated values of $(p_{\text{H}})_1$ and Table IV records the corresponding values of the minimum reaction velocity v_1 .

 TABLE III
 $(p_{\text{H}})_1$ values for the mixtures cCH₃·CO₂H : 1C(CH₃·CO₂Na)

<i>c</i>	0.01	0.05	0.10	0.20	0.50	1.00
$(p_{\text{H}})_1$, obs.	4.23	4.01	3.88	3.72	3.50	3.23
$(p_{\text{H}})_1$, cal.	4.37	4.02	3.85	3.72	3.52	3.37

TABLE IV

v_1 values for the mixtures cCH₃·CO₂H : 1C(CH₃·CO₂Na)

<i>c</i>	0.01	0.05	0.10	0.20	0.50	1.00
$v_1 \cdot 10^6$ obs.	0.056	0.164	0.273	0.461	1.020	1.91
$v_1 \cdot 10^6$ cal.	0.054	0.165	0.254	0.457	1.025	1.89

In the case of the series with the highest acid concentration ($c = 1.0$) there is reason to believe that complex ion formation comes into play as a disturbing factor. For all the other series the agreement between the observed and calculated numbers is within the limits of experimental error.

Velocity of reaction for homo-isohydric solutions

Reference may now be made to results (cf. Dawson and Hoskins, *Proc. Leeds Phil. Soc.*, 1926, 1, 108), which have been obtained in the investigation of comparable acid-salt mixtures of the second type referred to, namely those for which the ratio of the acid and salt concentrations has a constant value. Such solutions form a homo-isohydric group in that the same ions are always present whilst the concentration of the hydrogen ion remains fixed.

The experimental results to be described were made with a series of acetate buffers for which the acid/salt ratio is equal to unity. The calculated p_{H} value for this series is 4.73. Since the catalytic coefficient for the hydroxyl ion is about 10,000 times as great as that for the hydrogen ion, the effect of the hydroxyl ion must be taken into account in considering the results for this series of solutions.

The total reaction velocity is therefore given by

$$v = v_h + v_a + v_m + v_{\text{OH}}$$

$$k_h \cdot [\text{H}] + k_a \cdot [\text{A}] + k_m \cdot [\text{HA}] + k_{\text{OH}} \cdot [\text{OH}]$$

Since $[\text{H}]$ and $[\text{OH}]$ are constant throughout the series, the sum of the first and last terms has a fixed value, namely, 0.02×10^{-6} . Denoting by c the concentration of the acid and the salt, the above equation becomes

$$c = (k_a + k_m)c + 0.02 \times 10^{-6} \quad (6.06 + 0.02) \times 10^{-6}$$

The observed and calculated reaction velocities for solutions in which the concentration c varies from 0.005 to 1.0 are compared in Table V.

TABLE V

Reaction velocities for isohydric solutions

c	0.005	0.01	0.02	0.05	0.10	0.20	0.50	1.00
$v \times 10^6$ obs.	0.019	0.078	0.131	0.305	0.50	1.24	3.59	8.05
$v \times 10^6$ cal.	0.0.0	0.080	0.110	0.320	0.620	1.22	3.02	6.05

Excluding the two most concentrated solutions which show clearly the incidence of disturbing factors (complex ion formation) there is very close agreement between the observed and calculated velocities. The velocity for the 0.20 solution is about twenty-five times as great as the velocity for the 0.005 solution and about sixty times that which would be expected on the assumption that the catalytic agents are the hydrogen and hydroxyl ions. The results are therefore vastly different from those which the older views would lead us to anticipate.

A generalised reaction velocity equation

We may now return to the further consideration (cf. Dawson, J.C.S., 1927, 243) of constant acid series of acid-salt mixtures for which the reaction velocity is expressed by equation (2). Since all acid/salt mixtures can be grouped into constant acid series, for each of which the relation between v and p_{H} is represented by a curve of catenary type, it follows that the entire catalytic relations can be expressed by a series of juxtaposed catenaries which give rise to a catenary surface when the reaction velocity, p_{H} value, and acid concentration are unidimensionally co-ordinated (cf. Dawson, J.C.S., 1927, 756).

Within any given constant acid series, the variations in velocity are due entirely to changes produced by the

positive and negative ions, the joint effect of which is expressed by $v = v + k_m c$. The equation for the ionic reaction velocity is therefore

$$v = (k_h + k_m) \cdot [\text{H}] + k_a K c / [\text{H}] \quad \dots \dots (7)$$

according to which the connexion between the ionic velocity and the hydrogen ion concentration is expressed in terms of the catalytic coefficients k_h , k_a , and k_m , the ionisation constant K and the concentration of the acid c , which is also constant for the solutions belonging to a given constant acid series. By a very simple procedure it is possible to eliminate the whole of these constants and to derive a general formula connecting the ionic reaction velocity with the hydrogen ion concentration.

If, namely, the hydron concentration $[\text{H}]$ for any solution is expressed in terms of the hydron concentration

$[\bar{\text{H}}]_0$ of the corresponding M.V. mixture such that

$v = [\text{H}]^n / [\bar{\text{H}}]_0$, then equation (7) may be written

$$v = (k_h + k_m) \cdot n [\bar{\text{H}}]_0 + k_a K c / n [\bar{\text{H}}]_0$$

and since $[\bar{\text{H}}]_0 = \sqrt{k_a K c / (k_h + k_m)}$ cf. equation (3)

we obtain $v = (n + 1/n) \cdot \sqrt{(k_h + k_m) k_a K c} \dots \dots (8)$

If, further, the ionic reaction velocity v is expressed in terms of that for the corresponding M.V. mixture, such that $v = v_0/n$, then since

$$v_0 = 2 \sqrt{(k_h + k_m) k_a K c} \quad \text{cf. equation (4)}$$

we have $v = v_0/n = \frac{1}{2}(n + 1/n) \dots \dots (9)$

Equation (9) expresses in general terms the connexion between the reduced ionic velocity v and the reduced hydrogen ion concentration n .

If $\log_{10} n = \log_{10} [\text{H}] - \log_{10} [\bar{\text{H}}]_0 = (p_{\text{H}}) - (p_{\text{H}})_0$ be denoted by Δp_{H} , then Δp_{H} represents the reduced p_{H} value of the solution in question, and equation (9) may be written in the form

$$v = \frac{1}{2} (10^{\Delta p_{\text{H}}} + 10^{-\Delta p_{\text{H}}}) \dots \dots (9A)$$

This is the equation of a catenary, and, since no specific constants are involved, it expresses quite generally the connexion between the reduced ionic velocity and the reduced p_{H} value. Its applicability would appear to be independent of the nature and concentration of the catalysing acid, of the temperature, of the nature of the solvent, and of the nature of the catalysed reaction. It may also be shown to be valid if the anionic catalytic effect is shared by the anion of a dissolved acid and the hydroxyl ion which, under certain circumstances, comes into play simultaneously when water is the solvent. Equations (9) and (9A) are thus to be regarded as alternative expressions of a general relation which is applicable to all acid catalysed reactions in so far as the velocity of these depends on the joint action of hydrogen ions and catalytically active anions.

In the derivation of this general relation, the procedure followed is analogous to that by which specific gas equations are transformed into constant-free general reduced equations of condition.

The data available for the testing of the generalised reaction velocity formula are necessarily limited, since

the determination of r requires a knowledge of n and n_0 , whilst the evaluation of Δp_H involves the measurement of p_H and p_{H^+} . For the most part the requisite information is only supplied by the experiments which have been made in connexion with the acetone-iodine reaction. Within these limits it has been found that the plot of the experimental values of r and Δp_H conforms closely to the general catalytic catenary (cf. Dawson *loc. cit.*). An alternative method of testing the experimental data is adopted here. This consists in comparing the observed values of Δp_H with those calculated from equation (9A) which may for this purpose be put in the form

$$\Delta p_H = \log_{10} (r + \sqrt{r^2 - 1}) \dots \dots \dots (9B)$$

In Table VI the relevant data are arranged in an order which is determined by the magnitude of r . The first ten have reference to the acetone-iodine reaction at 25°, the eleventh to the hydrolysis of methyl acetate at 85.5°, and the last to the hydrolysis of ethyl acetate at 85.5°. The first column indicates the catalyst used, the second gives the observed value of r , the third gives the experimental value of Δp_H , and the fourth the value of Δp_H calculated from (9B).

TABLE VI
Catalytic effects in relation to the general catenary
Catalyst

Catalyst	r	Δp_H (obs.)	Δp_H (ca.)
1 0.2 CH ₃ CO ₂ H : 0.1 CH ₃ CO ₂ Na	2.9	0.61	0.66
2 0.05 CH ₃ CO ₂ H	1.8	1.02	0.98
3 0.10 CH ₃ CO ₂ H	1.9	1.01	0.99
4 0.20 CH ₃ CO ₂ H	2.2	1.00	1.01
5 0.05 CH ₃ CO ₂ H : 0.16 CH ₃ CO ₂ Na	2.3	1.21	1.16
6 0.1 CH ₃ CO ₂ H : 0.02 CH ₃ ClCO ₂ Na	13.6	1.35	1.42
7 0.1 CH ₃ CO ₂ H : 0.1 CH ₃ CO ₂ Na	14.6	1.45	1.46
8 0.1 CH ₃ CO ₂ H	26.7	1.65	1.73
9 0.2 CH ₃ CO ₂ H : 1.0 CH ₃ CO ₂ Na	27.2	1.71	1.71
10 0.1 CH ₃ CO ₂ H : 1.0 CH ₃ CO ₂ Na	36.2	1.85	1.86
11 Strong acid (85.5°)	38	1.87	1.88
12 Strong acid (85.5°)	65	2.20	2.11

Having regard to the wide variations which are represented by the tabulated data—variations in the nature of the catalysed reaction, the temperature, the nature and concentration of the catalysing acid which is sometimes used in the pure state and at other times admixed with the corresponding salt—the concordance between the experimental data and the corresponding calculated quantities is such as to justify the belief that the reduced catalytic catenary represents a general expression for the effects which result from the joint action of the catalytically active positive and negative ions which are formed by the dissociation of acids.

From the table it is evident that the values of r and Δp_H for pure acetic acid in 0.05, 0.1, and 0.2 molar solution are identical within the limits of error. In other words, the reduced reaction velocity and the reduced hydron concentration depend only on the nature of the acid and not on its concentration. This experimental result is quite in accordance with the general theory, for it may be shown that the reduced hydrogen ion concentration of salt-free solutions of the

pure acids, *i.e.*, $n_0 = [H]_0/[H]_i$ is determined by the relative magnitudes of the catalytic coefficients k_h , k_a , and k_m as expressed by the equation

$$n_0 = \sqrt{k_a/(k_h - k_m)} \dots \dots \dots (10)$$

The reduced ionic velocity for pure acid solutions is then given by

$$r_0 = \frac{1}{2} \{ \sqrt{k_a/(k_h - k_m)} + \sqrt{k_h - k_m}/k_a \} \dots \dots (10A)$$

For a given reaction taking place at a definite temperature in a given solvent medium, the value of n_0 and therefore the position occupied by a particular acid on the reduced catalytic catenary is independent of its concentration. Since for the weaker acids k_m can be neglected in comparison with k_h , it follows that this position is determined by the relative magnitudes of k_h and k_a . If $k_h = k_a$ the pure acid takes its place at the apex of the catenary. According to whether k_h is greater or less than k_a , it falls on the left or on the right branch of the catenary.

The essential difference between the catalytic effects which are produced by the joint action of the hydrogen and hydroxyl ions, derived from the very weak acid H₂O, and those which result from the joint action of the ions from acetic acid, lies in the fact that k_{OH}/k_h for most reactions is much greater than unity, whilst the corresponding ratio k_a/k_h for the acetic and hydrogen ions is much less than unity. There would seem, indeed, to be no satisfactory reason for differentiating between the hydroxyl ion and other acid anions.

Finally, in regard to the general catenary, it may be noted that the movement of an index point along the curve from left to right (in the direction of decreasing acidity) affords not only a representation of the changes in catalytic activity which are produced by the addition of a salt to the corresponding acid, but show clearly the gradation in the catalytic properties of the pure acids as a group, in that the catalytic activity of the acid anion increases as the catenary is traversed from left to right. This increase in the catalytic activity of the anion would seem to run parallel with the diminution in the ionisation constant of the acid and with a decrease in the catalytic activity of the undissociated acid.

From the foregoing account of recent developments it should be clear that a knowledge of iso-catalytic data is of the greatest importance in the study of catalytic effects. From the equations which connect the iso-catalytic data with the catalytic coefficients it is possible to derive the values of catalytic coefficients which cannot be obtained by direct experiment. In this way it has been shown (Dawson, J.C.S., 1927 1146) that the ratio k_{OH}/k_h varies between very wide limits for a series of hydrolytic reactions. For the hydrolysis of benzanide the value of this ratio is approximately unity, whilst for the hydrolysis of ethyl amino-acetate its value is about ten million times as great.

The above equations have also been applied (Dawson, J.C.S., 1927, 1290) to the determination of the dissociation constant of water at different temperatures. The value so obtained is 1.25×10^{-11} at 25° and 34×10^{-14} at 85.5°.

In concluding this brief statement of some of the results which have been obtained in the Physical Chemistry Department of the University of Leeds, we would venture the opinion that the sum total of our observations provides a very strong argument for the general correctness of the views which have been put forward.

SILICA GEL

The use of silica gel as an adsorbent of certain gases has been known for some time. The substance is characterized by the complete reversibility with which it works. As a dehydrating agent it has many possible applications in industry, and it is the object of this short article to describe the results of one such application made in blast-furnace practice.

Blast furnace practice

In this industry the weight of air admitted into the furnace exceeds the total weight of all other materials

FIG. 1

Silica gel plant. Position of valves during adsorption

charged into the furnace. It is therefore not surprising that much attention has been paid by ironmasters in the past to the condition of the air, and to the effect produced by its most variable constituent, viz., moisture. The important part played by the moisture of the atmosphere is realised when it is pointed out that air containing 5 grains of moisture per cubic foot—which is not excessive

or by chemical adsorption have not been successful in practice.

The silica-gel plant to be described has been installed in the works of the Glasgow Iron and Steel Co. at Wishaw; the data have been furnished by Mr. E. H. Lewis, M.A.,

FIG. 2

Silica gel plant. Position of valves during activation

of this firm. The plant is designed to treat 35,000 cu. ft. of air per minute and it has been in operation since April of this year.

It is found that silica gel can adsorb at atmospheric temperature from 30-50% of its weight of water, and that by raising the temperature—done by passing waste blast-furnace gas at 610° F.—this water can be driven off, leaving the reactivated gel ready for another cycle. About 2 lb. of gel is used for each cubic foot of air to be treated per minute.

The plant

The plant consists of a battery of six adsorber units placed side by side and arranged so that the gel in any one

FIG. 3

Arrangement of silica gel plant

atmospheric humidity contributes 100 lb. of water to the furnace per ton of pig iron made. Previous attempts to reduce the moisture of the blast by freezing

element can be activated while the gel in the other five is adsorbing moisture from the atmosphere. Running the whole length of the battery are three ducts or pipes,

one along the front or entry side and two along the back or outlet side. These are connected by branches to each adsorber. The branches from the entry duct are fitted

FIG. 4

Silica gel house. Dry air duct on extreme right

with two-way dampers arranged so that five are closed to the hot activating gas and open to the atmosphere,

FIG. 5

Activating gas furnace, burner control valves, and instrument board

while the sixth closes one adsorber to the atmosphere and opens it to the entry of hot activating gas. The branches

from the two outlet ducts are fitted with similar two-way dampers mechanically coupled with those on the inlet side of the battery. These dampers connect the one activating adsorber with the wet air duct and the five adsorbing units to the dried air duct. An induction fan draws the hot activating gas through the saturated gel

FIG. 6

Top of adsorbers (inlet side), atmospheric inlet duct on right, dust separator and cooling air duct in background

and discharges the moisture through an uptake to the atmosphere.

The adsorber unit

The adsorber unit consists of a steel box about 17 ft. high. It contains 10 mesh-bottomed trays on which rest 6 tons of gel in granular form. These trays are

FIG. 7

Plant under construction. Dry air and wet air ducts, with damper valve boxes

suitably inclined to expose the gel efficiently to the flow of the air of the atmosphere, or to the activating gas as the case may be. Filters are placed at the atmospheric inlet to remove dust from the incoming air. The heat for activation is provided by the combustion of blast-furnace gas, which has been cleaned in the process

of recovering the by-products from the raw coal used in the furnaces. The gas is burnt in a small combustion chamber, and an excess of air is admitted to reduce the temperature of the activating gases to about 640° F. (338° C.). The time required to activate one unit is about 1½ hrs., during the latter part of which the gas is turned off and air only is drawn through to cool down the gel to a temperature at which it is able to adsorb moisture.

A constant moisture in the blast of about 1 gram per cubic foot is aimed at. Since in cold weather the plant gives a degree of dryness below this, an adjustable inlet for atmospheric air exists between the dehydrating plant and the blower to dilute the dried air up to the moisture aimed at.

The running cost of the plant is low, consisting mainly of the heat necessary for activation. One man is sufficient to control the plant, and the power required is about 20 h.p. Even to those who use their blast furnaces as gas-producers, the installation of a silica gel plant promises to provide a substantial return on the capital cost.

INSULATING OILS

By CECIL O. HARVEY, B.Sc., A.R.C.S., A.I.C.

Insulating oils for use in electrical transformers are required to have such special properties that they have almost become a subject unto themselves.

The production of a low viscosity oil of low iodine value and high flash point, which does not deposit "paraffins" at temperatures well below the freezing point of water, and which contains a low percentage of matter volatile at 100° C., calls for the use of special "crudes" to which not all oil refiners have access. In addition the oil must have exceptionally good insulating properties, be without action upon any part of the transformer, and must not undergo rapid chemical change when subjected to elevated temperatures and electrical stresses in the presence of atmospheric oxygen.

Such oils must be of the hydrocarbon type, and are therefore essentially highly refined mineral oils of suitable viscosities, which must comply rigidly with the specifications adopted by the various authorities. The British Engineering Standards Association Specification¹ allows for the use of two grades of oil in transformers, designated respectively as "A" and "B" quality oil, the former having a maximum sludge value of 0.1% and the latter a maximum value of 0.8%.

Low insulating power in an otherwise satisfactory oil is invariably due to the presence of moisture, the effect of which is greatly increased if fibrous particles are also present. These objectionable constituents may be removed by centrifugal treatment, and in this connexion it is interesting to note that the quantities of water concerned are of the order of 0.005%.

The most important property of a good transformer oil is undoubtedly its capacity for resisting atmospheric oxidation and freedom from tendency to form sludge.

Rodman² states that three distinct types of sludge are found in transformers, namely, asphaltic, soap, and carbon sludge.

Asphaltic sludge consists largely of oxygenated bodies of high molecular weight, and has good insulating pro-

perties, its detrimental action being due to its low heat conductivity and tendency to increase the viscosity of the oil, with consequent overheating of the transformer windings.

Soap sludge, as its name implies, arises through the development of acidity in the oil, subsequent action upon the metallic parts of the transformer giving rise to salts of organic acids, which have poor insulating properties.

Carbon sludge, caused by "arcing" or "corona discharge," is less common. It has poor insulating properties, but may be removed from the oil by filtration or centrifugal purification.

With regard to the prevention of sludge formation, a good oil should be used, but it must be remembered that even the best oil is capable of undergoing oxidation, and atmospheric oxygen should therefore be eliminated from the transformer as far as possible by using some form of oil conservator. Other features which should be taken into account and avoided as far as possible are (a) conditions giving rise to "silent discharge" and local overheating; (b) contact with substances which will catalytically assist in the oxidation of the oil,* i.e., clean iron, lead, and copper surfaces, and varnishes containing "driers"; (c) the use of materials containing volatile hydrocarbons,² and of synthetic resin products containing excess of phenols or aldehydes. In paper insulating core laminations, the use of papering paste containing excessive quantities of alum, caustic alkalis, or other added mineral matter should be avoided. Calcium carbide should not be used as an air-drying agent in "breathers," as the acetylene generated may form explosive metallic compounds, and will, upon passing into the oil, assist in the formation of sludge.

Precautions having been taken to avoid all objectionable features in the transformer, the quality of the oil remains to be considered.

In carrying out Dr. Michie's sludge test,¹ the oil is maintained at a temperature of 150° C., and is air-blown continuously for 45 hrs., the sludge being weighed after the addition of petroleum ether and standing overnight. The test is very tedious, and is rendered more difficult to carry out by the fact that the quantity of air and the temperature must be very carefully controlled. Furthermore, Stäger⁴ points out that in tests of this nature no account is taken of acids and superoxides formed during the oxidation, which do not necessarily contribute towards the sludge value, but which may nevertheless detract from the insulating properties of the oil, and may exert a very deleterious action upon the copper windings and their cotton or paper insulation, particularly if unvarnished paper insulation is used. Subsequent decomposition of superoxides will give rise to nascent oxygen, which may cause rapid oxidation of the oil.

Kissling's tar test,⁵ on the other hand, takes account only of the acidic substances formed during oxidation, and there is, naturally enough, no relationship between the tar number and the sludge value for a given oil.

* Bulkov,³ in attempting to identify the antioxidant agents of petroleum resins, finds that certain substances (α -naphthol, α -naphthylamine, etc.) exert a strong antioxidant action, but it seems probable that the delayed oxidation having commenced, the presence of such substances may assist in the formation of sludge.

In the Brown Boveri test,⁴ an attempt is made to determine sludge, developed acidity and superoxide development (the last by a Fehling's reduction method on cotton yarn which has been heated in the oil), and this appears to be the most thorough method of testing suggested up to the present.

Stäger maintains that, contrary to general belief, acid formation precedes sludge formation, the unsaturated hydroxy acids formed giving rise to lactones, and polymerisation of these causing deposition of sludge. It is generally agreed that "sludging" is primarily due to oxidation—the changes involved are undoubtedly very complex, but it is interesting to consider relatively simple changes which the various classes of compounds liable to be present in hydrocarbon oils may undergo upon oxidation.

According to Stäger, the temperature employed in the Michie test is too high, fatty acids of low molecular weight (*e.g.*, acetic acid) being formed by decomposition of the oil. Paraffin hydrocarbons are not likely to undergo such drastic changes under normal working conditions, though it is possible that, under the combined influences of oxidation and heat, "cracking" and dehydrogenation may occur, resulting in the formation of paraffins of lower molecular weight, olefins, naphthenes, aromatics, etc.

Olefins, if present in a petroleum distillate, are usually considered to be "cracking" products. In the presence of metallic salts, polymerisation of these compounds may occur, but a greater danger lies in the possibility of ozonide or peroxide formation, with subsequent formation of aldehydes, ketones, and acids, the ability of the oil to take up as much as 15% of its volume of atmospheric oxygen² making the formation of ozone possible.

Brooks¹⁰ has obtained small quantities of butyl aldehyde and acetone by simple atmospheric oxidation of amylene.

Diolefinic substances may undergo similar changes to the olefins, and polymerisation may take place in cases of

conjugation of double bonds, as happens in the preparation of butadiene rubbers. Polymerisation after peroxide formation may also occur.

Naphthenes may be changed by oxidation or "cracking" into naphthylenes etc., and naphthylenes may undergo similar changes to the olefins, or may give rise to asphaltenes. Conjugation of double bonds may possibly cause the formation of rubber-like substances in a manner analogous with the *cyclo-octadienes*.

Aromatic hydrocarbons may undergo direct oxidation to acids, or acid formation may take place via the ozonides.

The effect of sulphur upon caoutchouc, and the influence of accelerators on the rate of vulcanisation suggest that the presence of sulphur- and nitrogen-containing substances in the oil may assist polymerisation, this theory being indirectly supported by the fact that asphaltenes, obtained from natural asphalts, contain combined sulphur.

Phenols, if formed during oxidation of the oil, or derived from bakelite products, may combine with aldehydes and ketones arising from unsaturates and aromatics, forming resinoid bodies (phenol-aldehyde resins). Brooks¹⁰ states that the resins formed during the oxidation of "cracked" gasolines are acidic, not aldehydic, but this does not preclude the possibility of aldehydic condensation occurring in the oil in use in a transformer.

This summary of reactions which may take place in the oil is not put forward as an exhaustive theory accounting for sludge formation. The changes occurring are undoubtedly very complex, but, from a consideration of these simple suggestions, it is obvious that all classes of compounds other than naphthenes and paraffins are liable to give rise to objectionable products, and even naphthenes and paraffins may undergo slow oxidation.

At this point reference must be made to two recent papers bearing on the subject. Becker⁶ states that mineral and fatty oils, subjected to a silent discharge, undergo molecular condensation with loss of hydrogen and an increase in viscosity. It is therefore possible that changes in the properties of an oil may occur in the absence of air. Van der Heyden and Typke⁷ have found that the development of sludge and acidity may occur owing to the action of light, and care should therefore be exercised when storing samples of oil, or discrepancies in the analytical results may arise. This observation accords with Brooks' statement that "cracked" gasolines, exposed to air and sunlight, develop a positive peroxide reaction, and give a "doctor" test closely resembling the true mercaptan reaction.

Obviously no definite relationship between iodine values and sludge values for different samples of oil can exist, as the sludge values may be expected to increase as the molecular weights of the unsaturated compounds increase, whereas the iodine values corresponding with, say, one unsaturated linkage will diminish as molecular weights increase, and, furthermore, some of the substances referred to as being possible potential sources of instability will not contribute towards the iodine value of the oil, *e.g.*, aromatic hydrocarbons. (Note.—A sample of benzene, not specially purified, was found to have a Wijs iodine value of 0.7, this slight

absorption of halogen being probably caused by impurities).

The "formolite number" serves merely as an indication of the proportion of aromatic and naphthylene substances present, and, even if determined by Ratchffe's methylal method,⁸ is difficult to carry out satisfactorily.

Attempts have been made to connect the sludging propensities of oils with their colour intensities. Undoubtedly good transformer oils are practically devoid of colour, but it does not follow that the converse statement can be relied upon, and, according to a report of the British Electrical and Allied Industries Research Association,¹¹ colour tests are of little value as criteria of the sludging characteristics of oils.

As far as the author is aware, the selective absorptions of these oils in the invisible regions of the spectrum have not received any attention. Work in this direction might prove to be of interest.

It appears that a method of examining transformer oils, more rapid and satisfactory than the methods proposed hitherto would be very welcome. Such a method must be free from the limitations from which sludge tests, tar tests, etc. suffer, in that it must be capable of detecting the presence of all objectionable substances, whether they be "sludge formers," "acid formers," or "peroxide formers." All substances capable of undergoing oxidation to form acids or peroxides will not necessarily give rise to sludge, and a method is required which will detect instability in oils having low sludge values, and which will, at the same time, be less tedious than the procedure adopted by Stäger.

Interesting, but only partially successful, experiments carried out by the author during the past twelve months are being continued, and it is hoped that at some future date it may be possible to place on record an entirely new method.

REPORT OF THE GOVERNMENT CHEMIST*

During the year 469,642 samples were examined at the Government Laboratory and at chemical stations, compared with 445,606 in the preceding year. There was a decrease of 3594 samples examined at the Custom House branch, but the number examined at Clement's Inn showed an increase of 14,716, and at the chemical stations an increase of 12,914. The samples of wine increased from 106,395 to 122,749, and there was a decrease of 4434 samples of tea compared with the previous year. There was an increase of 1297 in the samples of exported tobacco and snuff, indicating that the increase in exports referred to last year has been maintained. The numbers of samples of cocoa goods and of imported and exported spirituous preparations increased, as did the number

of samples examined in connexion with the subsidy on British sugar. Owing to the new duties on silk and artificial silk the examination of over 22,000 samples was necessary during the year, and the work in connexion with the Safeguarding of Industries Act again involved the examination of nearly 10,000 samples. The contracts branch of the Admiralty submitted 47 samples of food on tender for report as to conformity with specification and opinion as to relative merits, and 203 samples were submitted by the technical examining officers at the victualling yards with the object of preventing the issue of canned foods contaminated with metals. Other samples numbered 86, and in addition the determination of the salinity of 1325 samples of sea-water was carried out.

Of the 847 samples of butter examined during the year, three contained more than 16% of water. No samples of milk-blended butter were received: 65 of the samples received were from Scottish ports.

Four of the 341 samples of margarine contained more than 16% of water, but there was no evidence of butter fat in excess of the legal quantity in any of the samples, 53 of which were taken in Scotland and 8 in Northern Ireland.

The proportion of fat in cheese was found to vary from 9.1 to 45.0%, or from 20.5 to 65.6% of the dry matter in the cheese. Some of the cheese had thus been made from skimmed milk, but no exception could be taken, as there are no appropriate regulations to control the marking of skimmed milk cheese.

Twenty-five samples of preserved cream and 80 of unpreserved cream were examined, the unpreserved cream containing from 20 to 33% of fat, with the exception of two samples containing 50% of fat. The preserved cream contained 47 to 52% of fat. These samples were tested not only in relation to the Food and Drugs Acts Regulations, but to ascertain whether they conformed with the Milk and Cream Regulations, issued by the Ministry of Health under the Public Health Acts. Only one sample of tinned sterilised milk was examined. Of the 60 samples of condensed milk examined under the provisions of the Sale of Food and Drugs Acts, 8 of the samples, 3 of which were milk powder and 5 condensed milk, had been prepared from skimmed milk or partially-skimmed milk, but the packages from which the samples had been taken were not marked "Machine-Skimmed Milk," as required by the Act. Three samples imported as milk powder or block milk were found to have been derived from machine-skimmed milk, without anything in the marking to indicate that the fat had been removed before their preparation. In addition, 153 samples were taken under the Public Health (Condensed Milk) Regulations, which came into force on October 1, 1923, and 43 of these were reported against. In five cases the milk was below the minimum standard quality fixed by the Regulations, and in three cases the statement on the label of the quantity of whole milk which the contents of the tin represented was untrue, the amount being overstated. In other cases the offence was connected with the labelling. All the samples were free from chemical preservatives. Of the 21 samples of margarine taken at factories in this country, three contained water

* Report of the Government Chemist upon the work of the Government Laboratory for the year ending March 31, 1927, with appendices. Pp. 42. H.M. Stationery Office, 1927. Price 1s. 3d.

in excess of the legal limit. One sample of butter taken was found to contain vegetable oil.

Samples of sheep dip, numbering 118, were taken during the year, 22 being reported as defective. Thirty-six samples of river water and effluents were also examined. A river receiving effluent from a beet-sugar factory was under systematic survey to collect information on the effect of the effluent upon the river water. The Board of Agriculture for Scotland submitted 15 samples of water in connexion with the water supply of farm settlements, and reports based on chemical and bacteriological examination were made as to the suitability of the water for drinking and other purposes. Sea-water samples were examined in connexion with a scheme of oceanic research carried out by the Fisheries and by the Fishery Board for Scotland, acting in concert with the International Council for the Exploration of the Sea. The salinity of 4385 samples, including 979 samples from the Fishery Board for Scotland, was determined, in addition to those examined for the Admiralty.

Various deficiencies and impurities were found in fertilisers and feeding-stuffs. During the year two fertilisers and eight feeding stuffs were reported upon. The fertilisers consisted of a mangold fertiliser deficient in potash and a blood and bone fertiliser. The feeding-stuffs included barley meals, decorticated cotton seed meal, fattening meal, fish meal, and Sussex ground oats. Three samples of barley meal were found to contain from 33 to 40% of wheat offals, maize meal, or mixed cereal meal, and one sample contained a large proportion of barley offal. The fattening meal was deficient in proteins, the fish meal contained an excess of oil and a deficiency of proteins, and the Sussex ground oats contained 20% of tapioca meal and 15% of wheat and barley.

The Committee of Chemists, called together by the Government Chemist at the request of the Ministry of Agriculture to formulate a method of estimating fibre in feeding stuffs which could be prescribed for use under the Fertilisers and Feeding Stuffs Act, 1926, has forwarded a report on the suggested method to the Ministry.

The total number of samples of beer examined for the year for assessment of duty was 56,725, or an increase of 1198 samples. Out of the 484 samples of brewing materials examined, 233 were malt, corn, brewing sugars, or exhausted grain, and 251 yeast foods and miscellaneous substances used, or proposed to be used, in the preparation of beer. Fifty-three samples were found to contain arsenic in slight excess of the limit laid down by the Royal Commission on Arsenical Poisoning. Many duty-free spirits, including methylated spirits, specially denatured spirits, and other manufacturing spirits, were examined and 718 samples of wood naphtha and mineral naphtha, and 148 samples of pyridine were examined for fitness for methylating. All these samples were approved. Of 75 samples of methyl alcohol, 15 were found liable to duty on the ground of potability. Thirty-two samples of fusel oil from British distilleries were examined, and out of these two were found to contain more than 15% of proof spirit.

The Merchant Shipping Act provides that every foreign-going ship shall carry a supply of lime or lemon juice, and that one ounce per day shall be served out to

every member of the crew after the ship has been at sea for 10 days. Two hundred and thirty-three samples of raw lime and lemon juice were submitted for approval, of which none was found to conflict with the existing regulations. Of fortified juice sent for examination before being bottled, or for re-approval, 93 samples were received, two of which proved to be unsuitable for use. The quantity of juice approved was 28,326 gals. In the early days of the use of fruit juice as a preventive or curative agent for scurvy, the juice of lemons alone was employed, but for some time the juice of limes has been recognised as equally suitable for the purpose. The work carried out during recent years upon accessory food factors (vitamins) has, however, shown that lime juice is not a satisfactory antiscorbutic agent. On the other hand, orange juice and lemon juice possess valuable antiscorbutic properties, and their activity is retained for considerable periods if the juice is suitably preserved and stored. An Order in Council has now been issued (The Merchant Shipping (Antiscorbutics) Order in Council, 1927) making provision for the use, if desired, of concentrated orange juice. The Order gives the specification for the juice, and, *inter alia*, it is required that it shall be so prepared and stored that there is no material loss of vitamin potency.

Of imported colours, lakes and other goods, nine samples were examined to ascertain whether they involved liability to Customs duty, and whether they contained synthetic organic dyes, of which the importation is prohibited.

Examination was made of numerous samples of sugar (including 3994 samples of beet pulp, beet juice, molasses and refined sugar), glucose and saccharin; also of table waters, tea, tobacco, wines, and of 778 samples for the Air Ministry, which included silicon and one sample of petrol containing lead tetraethyl.

ONTARIO WINE INDUSTRY

Under prohibition, in Ontario, alcoholic beverages were not permitted to be sold for consumption, except native wines, which could be purchased direct from the vintner and consumed in private dwellings. This provision greatly assisted in developing a market for these wines, which the winery proprietors early recognised. The services of the chemist were requisitioned, and to-day the wineries are producing Canadian champagnes, burgundies, tokays, ports, clarets, sauternes, and sherries which have proved highly satisfactory. While the production of wine in 1923 was only about one million gals., it is estimated this year it will exceed three million gals. In the past the grape growing industry has been almost wholly confined to the Niagara peninsula district. Owing to the devastation caused by the corn-borer in Essex and adjacent counties, the farmers of these districts have turned their attention to other agricultural products, and have discovered that an acre of grapes brings eight times the profit of an acre of corn, so many of the farmers of South-west Ontario have planted vineyards. To provide a market for the grapes within the district, a winery has been established at Walkerville, Ontario, under the management of a French expert, and the plant of a former large U.S. winery has been transferred to the Ontario establishment.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on other such occasions as the Council may direct.

ROTHAMSTED LIBRARY

By the courtesy of the Lawes Agricultural Trust, any member of the Society of Chemical Industry, on presenting a card from the General Secretary, shall be allowed access to this Library. The rules of the Library preclude journals and periodicals from being sent out, and these are, therefore, always accessible.

A catalogue of the journals and periodicals is in the Society's Offices at Central House, and may be consulted there by members.

GLASGOW SECTION

The 1927-28 session of the Glasgow Section opens on October 19 with a joint meeting with the Chemical Engineering Group, in the Ca'doro Restaurant, to hear a paper on "The desiccation (De Vecchus) process of beet sugar manufacture," by C. Scott Garrett, M.B.E., D.Sc., and G. W. Riley, M.I.Chem.E. On November 9 a joint meeting held in the Institute of Chemistry will be addressed by C. M. Keyworth, M.Sc., on "Research in the textile industry." On December 7 Dr. D. F. Twiss will speak on "Rubber," followed by C. Chapman, A.I.C., A.M.I.Chem.E., on "Naphthas, and their uses"; this meeting will be a joint one with the Edinburgh Section and the Institution of the Rubber Industry, and will take place in the Ca'doro Restaurant. The 1927 meetings end on December 14, when the Ramsay Chemical Dinner will be held. In 1928 Dr. C. H. Lander will speak on "The fuel problem" on January 17, and on February 22, at a joint meeting with the Institute of Chemistry, Mr. J. W. Hawley, B.Sc., will speak on "Some aspects of toxicology." The annual business meeting will take place on March 23, followed by a joint smoker with the Institute of Chemistry, and on May 25 a meeting will be held at St. Andrews, when Principal Sir J. C. Irvine will speak; the meeting will be followed by a dinner. The closing meeting will be held on May 26 jointly with the Edinburgh Section, when golf will be the order of the day.

LONDON SECTION

The opening meeting of the Session was held at the Society of Arts, on October 3, when the Chairman, Mr. W. J. A. Butterfield, M.A., F.I.C., who is one of the Gas Referees, gave an address on "The gas industry: past, present, and future." During the delivery of the address the chair was taken by Dr. Charles Carpenter, C.B.E., D.Sc., President of the South Metropolitan Gas Company and a Past President of the Society.

In introducing Mr. Butterfield, the Chairman said he knew of nobody better fitted to deal with the subject of the lecture than Mr. Butterfield, because his knowledge of the industry dated back very many years, and he had been associated with it in different positions and had seen the developments, which had been particularly striking, during the past 20 years. From his official position, too, Mr. Butterfield had been able to envisage the workings of the industry, its development, and its progress more impartially probably than anyone else.

Among public utility services, said Mr. Butterfield, the gas industry, which started in London in 1812, is older than the railways and electricity supply. It operates with less outstanding capital than either of them, yet its receipts are considerably greater than those of electricity undertakings and more than half as much as those of the railways. It is the only public utility service which is fundamentally a chemical industry, and the only one which was not interrupted, more or less generally, by the general strike and the miners' stoppage of last year. It achieved this distinction through its preparedness in the matter of stocks of coal and oil, and the prevalence of co-partnership schemes among its employees.

Official testings were made throughout the troubles of 1926 on over 70% of the gas supplied in Great Britain, and as regards 70% of that gas, its average heating value was found to be as high as it should have been in normal times, whilst as regards a further 20%, the deficiency in heating value in any quarter did not average as much as 5%. Having regard to the cessation of the customary supplies of coal for many months, the gas industry achieved a remarkable record of public service in 1926.

Reproductions of record-sheets of continuously operating calorimeters, and summarised results of other official testings (thrown upon the screen), indicated that the "therm" system of charging for gas supplied has tended to reduce the proportion of non-heating constituents in the gas and to promote regularity in its heating value.

Gas from coke-ovens should be more extensively utilised for public gas supplies, but the coke-ovens concerned should be taken over by the gas undertakings, in order that they may not be involved in colliery labour disputes, and the public service thereby placed in jeopardy.

Gas is being used increasingly for industrial heating—for example, two contiguous works belonging to a single firm, and in reality constituting one premises, consumed over 89 million cubic feet of town's gas in 1926. The service-pipe to one consumer's premises is no less than 14 inches in diameter.

For street-lighting, the self-diffusing effect of the gas mantle gives it a great superiority over unobscured electric lamps, the high point-like intensity of which causes them to arrest the attention of drivers, who are then apt to overlook objects in the roadway. The growth of electric street lighting in certain areas may be associated with the fact that the Public Lighting Authority is usually the local authority, and that seven elevenths of the electricity sold in the country is supplied by local authorities, who supply only four elevenths of the gas. In such circumstances, and especially when the Borough Electrical Engineer is given the position of Public Lighting Engineer, gas does not obtain, as it should on merits, a virtual monopoly of street lighting.

Gas supply should be extended more rapidly to rural districts, and electricity generated locally from it where required, or from oil, instead of being carried by overhead high-tension transmission lines, which are a menace to airmen and others. There is irrefutable evidence of a more insistent and general demand for gas than for electricity supply. In Great Britain, $8\frac{1}{2}$ million premises have gas supplies, and reckoned on the heat, or potential energy, basis, the increase in the consumption of gas in the years 1922-1925 was $2\frac{1}{2}$ times the increase in the consumption of electricity.

The gas industry, besides being itself one of the oldest and largest chemical industries of the country, is the fountain-head from which other chemical industries originate.

The Chairman, in proposing a vote of thanks to Mr. Butterfield, referred to the advantages of co-partnership, as exemplified during the general strike of last year, when, he said, the employees of an electricity works all marched out whilst the men at an adjacent gas works remained at their posts. He then emphasised the point made by the lecturer as regards the importance of chemistry to the gas industry. This was being realised to-day far more than it had been in the past, and people who had set their minds at one time against such a recognition were now realising that it was impossible to carry on a gas undertaking without a scientific foundation of that kind. In the past the gas industry had been very largely run by gas engineers with only a partial assistance from the chemist, but that attitude was being entirely changed, and one of the reasons for the developments to which Mr. Butterfield had drawn attention was due to this fact. These developments, however, had been delayed in the past because of this want of recognition of the necessity for the chemist in the industry. So far as the electricity industry was concerned, it was evident from the address that this industry required a great deal of nursing; further, it was a pity that it should have been decided to put up two large generating stations in residential areas of London, having regard to the difficulties encountered from smoke and other troubles where the combustion of large quantities of coal was concerned. Referring to another aspect of the competition between electricity and gas, the chairman drew attention to the manner in which some local authorities who own electricity undertakings are endeavouring to compel the tenants on their housing estates to use only electricity, or at any rate to use no gas for lighting. The public should have a free choice in this matter.

Mr. C. S. Garland, seconding the vote of thanks, said it was a courageous thing for a man to get up in any scientific gathering and take a definite line and state a definite case. Mr. Butterfield had made out a perfectly good case for gas because, judging by the amount of noise made by the two industries, one would have thought it was the gas industry which was not making progress, whereas the curves and figures given by Mr. Butterfield, showed clearly that the gas industry was making the more rapid progress of the two. When an industry had to go to the extent of prohibiting the use of a competing commodity it must have a very poor case. At the same time, he was inclined to think the gas industry had itself to blame for some of the progress which electricity was making. It was often said that the gas industry did not worry about the lighting load and only wanted the heating, but his view was that every endeavour should be made to prevent electricity being used for lighting because once it got into the houses for lighting it was soon used for other purposes also. The gas industry was a striking example of an industry which had had its whole course entirely changed by scientific research work. The development of the gas mantle altered the whole position of the gas industry at a time when it was in a critical state, and but for the invention of the gas mantle in the early 90's or late in the 80's, the position of the gas industry might have been very different. By an extension of that scientific research work, he hoped to see the gas industry in the future supplying not only gas and smokeless fuel, but those liquid fuels which are essential to civilisation. The synthesis of alcohols and the hydrogenation of oil itself both would ultimately, he believed, depend upon the gas industry.

Mr. H. C. Honey, late Director of Gas Administration at the Board of Trade, spoke of the collaboration between himself and Mr. Butterfield in the inception and administration of the Gas Regulation Act of 1920, and expressed satisfaction that the Act should have resulted in such an increase in the technical efficiency of the industry as had taken place.

Mr. Butterfield, replying to the vote of thanks, said the address had been something of a departure from the usual subjects brought before the Section, but the chairman was entitled to a little licence on such an occasion and he admitted he had taken advantage of it. He expressed the hope that more members of the gas industry would become members of the Society of Chemical Industry, and that members of the gas industry would contribute papers to the Society dealing with scientific progress in the gas industry.

The Chairman, acknowledging a vote of thanks to himself, emphasised the remark made by Mr. Butterfield as to the accession of new members to the Society from the gas industry. No engineer engaged in the supply of gas could afford to be outside the Society and no chemist engaged in the gas industry was outside the Society.

CALENDAR OF FORTHCOMING EVENTS

Oct. 7.—Society of Chemical Industry, Manchester Section. 17, Albert Square, Manchester, at 7 p.m. Chairman's Address, by C. J. T. Cronsshaw, on "The seven lamps of chemical enterprise."

Oct. 8.—Biochemical Society, Biochemical Laboratory, Cambridge, at 3 p.m. (1) "The scission of gelatin into constituent proteins," by S. B. Schryver and K. V. Thimann. (2) "The interferometer method for the diagnosis of pregnancy and malignant growths," by G. S. Haynes and C. G. L. Wolf. (3) "The isolation of a second sterol from yeast fat," by I. S. MacLean. (4) "On the original of etheral sulphates," by T. S. Hele. (5) "The osmotic pressure of iso-electric egg albumin," by J. R. Marrack and L. F. Hewitt. (6) "Adsorption of phthalein dyes by proteins," by L. F. Hewitt. (7) "On a cell-free dehydrogenase obtained from bacteria," by M. Stephenson.

Oct. 10.—Institute of Metals, Scottish Local Section. 39, Elmbank Crescent, Glasgow, at 7.30 p.m. Chairman's address by S. E. Flack.

Oct. 11.—Institution of Petroleum Technologists. General Meeting. House of the Royal Society of Arts, John Street, Adelphi, W.C.2. at 5.30 p.m.

Oct. 12.—Institution of the Rubber Industry, London and District Section. Engineers' Club, Coventry Street, W.1. "Coagulation, structure and plasticity of crude rubber," by Dr. O. de Vries.

Oct. 12.—Institute of Metals, Swansea Local Section. Thomas' Café, High Street, Swansea, at 7.0 p.m. Chairman's address by Capt. L. Taverner.

Oct. 13.—Institution of the Rubber Industry, Birmingham and District Section. Grand Hotel, Birmingham. "Selling," by A. E. Hemsworth.

Oct. 13.—Institute of Metals, London Local Section. Rooms of the Society of Motor Manufacturers and Traders, Ltd., 83, Pall Mall, S.W.1, at 7.30 p.m. Chairman's address by A. H. Mundy, on "Works' economics."

Oct. 14.—Society of Chemical Industry, Chemical Engineering Group. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "A recent development of spray drying," by J. Arthur Reavell. During the same afternoon a visit will be paid to the Kestner Experimental Works at Camberwell, where a machine of the type to be described in the evening will be seen at work.

Oct. 14.—University of London, University College, Gower Street, W.C.1, at 5 p.m. "Hydrogen ion concentration," by Dr. Phyllis M. Kerridge. (Also on October 21 and 28.)

Oct. 14.—Institute of Metals, Sheffield Local Section. The University, Sheffield, at 7.30 p.m. Chairman's address by J. H. G. Monypenny, on "Science and industry."

Oct. 19.—Society of Chemical Industry, Glasgow Section. Jointly with the Chemical Engineering Group. Ca'doro Restaurant. "The desiccation (De Vecchis) process of beet sugar manufacture," by C. Scott Garrett and G. W. Riley.

Oct. 20.—Chemical Society. Ordinary Scientific Meeting. Burlington House, Piccadilly, W.1, at 8 p.m.

Oct. 27.—Society of Chemical Industry and Institute of Chemistry, Edinburgh and East of Scotland Sections. Joint Meeting. The North British Station Hotel, Edinburgh, at 7.30 p.m. Inaugural address by J. Adam Watson.

Oct. 28.—Society of Chemical Industry, Liverpool Section. The University, Liverpool, at 6 p.m. "Merseyside and chemical industries," by Dr. A. Holt.

INSTITUTION OF CHEMICAL ENGINEERS

The Institution of Chemical Engineers is opening its session for 1927—28 with an important lecture, to be delivered by Sir William Bragg, K.B.E., F.R.S. The subject will be "Crystallisation," and the meeting will be held in the Institution of Civil Engineers, Westminster, on Friday, October 28, 1927, the President, Sir Alexander Gibb, taking the Chair at 6.30 p.m. There will be no charge for admission, but tickets (to admit two) can be obtained on application to the Honorary Secretary, Institution of Chemical Engineers, Abbey House, Westminster.

Dr. E. R. Weidlein, the President of the American Institute of Chemical Engineers, who is also the Director of the Mellon Institute of Industrial Research, has just visited England. The President of the Institution, Sir Alexander Gibb, entertained him to dinner to meet the Council of the Institution on September 21. Mr. F. H. Carr, C.B.E., member of the Institution and President of the Society of Chemical Industry, and Mr. W. J. U. Woolcock, C.B.E., the first Honorary Member of the Institution, were also among the guests.

Dr. Weidlein gave an interesting account of the history of the Mellon Institute, and stated that since 1920 it had been entirely self-supporting, the necessary funds being obtained by industrial firms, desirous of making use of its services, buying a yearly fellowship. So successful has the scheme proved that there is now a waiting list of firms desirous of purchasing these fellowships. Other outstanding features of the Institute are that any discoveries and any patents which are taken out in connexion therewith are the property of the firm holding the fellowship in that particular research. An unwritten rule of the Institute is that the firms should reward the actual research worker for any successful exploitation of his work. The form of reward is at the discretion of the firm concerned, but so successful has been the system that permanent research workers of the Institute are often in receipt of yearly incomes from such firms which are larger than the salaries paid to them by the Institute. Cases have even been known in which the Institute has had to restrain the over-generosity of some firms. The Institute does not fear the ultimate setting-up of research laboratories by the firms themselves, for experience has shown that even if such laboratories are started, the firms are not only willing but anxious to continue their fellowships, since they realise that the workers in the Institute, not being so vitally concerned with the problems of a particular industry, are able to take wider views of such problems than a firm's own workers. At present 61 different investigations, covering an extremely wide field, are in progress, and the Institute is making large developments in the near future, so that it may be able to undertake fundamental scientific research as well as industrial research.

From Dr. J. V. N. Dorr, a Vice-President of the American Institute of Chemical Engineers and Chairman of the Committee charged with making the arrangements for the visit of the Institution to the United States of America next year, we learn that these are now nearly complete. It is hoped shortly to be able to announce details of the itinerary and of the cost.

The Annual Meeting for 1928 of the Society of Chemical Industry is to be held in New York, and endeavours are being made for the two gatherings to be so synchronised that members of both the British organisations can attend both meetings without being too long absent from this country.

The Annual President's Reception will be held on November 2, at Prince's Galleries, London, W.1. This will be Sir Alexander Gibb's first opportunity of meeting members since assuming office. Invitations will shortly be sent out.

PERSONAL AND OTHER ITEMS

On October 20 the Prime Minister will formally open the new biology block of the University of Birmingham. The new block will house the Departments of Biochemistry and Brewing, Botany and Zoology.

Josiah Wedgwood & Sons, Ltd., the famous potters of Etruria, England, have presented to the Priestley Memorial Museum, Northumberland, Pennsylvania, a Wedgwood blue medallion of Priestley made from the original mould. Priestley was a close friend of Josiah Wedgwood, the founder of the firm.

The following have joined the Board of British Celanese, Ltd.:—Brig.-General Sir William Alexander, M.P., managing director of Charles Tennant & Co., and a director of the Celanese Corporation of America and of Canadian Celanese; Mr. A. Chester Beatty, the American engineer; Mr. R. A. Murray, C.A., a director of the Clydesdale Bank, Burnah Oil Co., and the Scottish Western Investment Co.; and Mr. G. Whigham, chairman of the Celanese Corporation of America and Canadian Celanese, and a director of the Celluloid Corporation (New York). Dr. M. Soller, works manager, and Mr. G. H. Spilman, manager of the sales department, have also been appointed directors.

Mr. C. S. Garland, B.Sc., has been elected vice-chairman of the London Section.

Sir William Bragg, K.B.E., F.R.S., will deliver a public lecture before the Institution of Chemical Engineers on October 28 on the subject of "Crystallisation."

Mr. W. Macnab represented the Institution of Chemical Engineers at the Third Conference of Scientific Management, which was held recently in Rome.

Through ill-health, Mr. A. R. Warnes has been obliged to resign his seat on the Council of the Institution of Chemical Engineers. Mr. F. A. Greene has been co-opted in his place.

On the occasion of the opening of H. H. Wills Physics Laboratory at Bristol University by Sir Ernest Rutherford, on October 21, the honorary degree of D.Sc. will be conferred upon Prof. M. Born, Sir William Bragg, Prof. A. S. Eddington, Prof. A. Fowler, Prof. P. Langevin, and Sir Ernest Rutherford.

Miss Dorothy Jordan Lloyd, D.Sc., has been appointed to succeed Dr. R. H. Pickard, F.R.S., as director of research to the British Leather Manufacturers' Research Association. Dr. Lloyd has been a member of the staff of the British Leather Manufacturers' Research Association since its inception, and is the author of a book on

"The Chemistry of the Proteins and its Economic Applications."

Prof. Dr. Emil Heuser, Manager of the Research Laboratories of the Riordom Pulp and Paper Co., a subsidiary of the International Paper Co. of Canada, Hawkesbury, Ontario, is on a three months' leave of absence, visiting Darmstadt and other parts of Germany.

We regret to announce the death, at the age of 68, of Prof. Svante Arrhenius, whose name is linked with those of van't Hoff and Ostwald as the founders of physical chemistry. His work on the theory of electrolytic dissociation is classic, and for it he was awarded the Nobel prize for physics in 1903. He was a Davy medallist of the Royal Society and an honorary member of the Chemical Society and many other learned societies. In addition to his scientific work he was the author of several books of a popular nature, in which his graceful style and vivid pen were turned to the service of the dissemination of scientific culture.

The death is announced of Prof. W. Einthoven, one of the most famous of modern physiologists and the inventor of a number of beautiful physical instruments, amongst which the "string galvanometer" is prominent.

The death is announced of Sir W. D. Cramp, I.S.O., who was Deputy Chief Inspector of Factories from 1902 until his retirement in 1907. He was secretary to the Home Office Committee on Potteries in 1893, chairman of the Home Office Committees on Lucifer Match and Chemical Works, 1893, and on Brass Casting, 1894, and a member of the Factory Accidents Committee, 1900.

Mr. George H. Bostock, Chief Chemist of Ontario Factory Inspection, recently died in Toronto. He was born and educated in England, and went to Canada about 25 years ago. He was a member of the Society of Chemical Industry.

The deaths are announced from Germany of: Dr. O. Reinhardt, for 23 years in the service of the I.G. Farbenindustrie A.-G.; Dr. C. Scheuer, aged 83.

The late Mr. G. W. Pettit, managing director of Pettit & Sons, Ltd., chrome tanners, Northampton, left £21,436.

The late Mr. S. Colquhoun, of Paisley, analytical chemist, left £5699.

Conference on Methods of Coal Analysis

The British Engineering Standards Association announces the calling of a conference resulting from a request of the Committee of the Privy Council on Scientific and Industrial Research that British National Standard methods of coal analysis should be adopted. It is suggested that Report No. 7, "Methods of analysis of coal," as drawn up by the Fuel Research Board, should be used as a basis for the preparation of a British Standard Specification for national use. The conference above referred to is being called for the purpose of ascertaining if there is a consensus of opinion in favour of setting up a B.E.S.A. Committee to deal with the subject, and delegates have been invited from all interested bodies to attend.

The Committee of the Privy Council states that the question of methods of analysis is one of increasing

importance, owing to the growing tendency to purchase coal to specification, and this is especially so with foreign purchasers. They consider that the national adoption of standard methods of analysis would be of considerable advantage, both to the producers and the users of coal.

World Power Conference—Fuel Conference, 1928

A meeting of the International Executive Council of the World Power Conference was held at Cernobbio, North Italy, from September 5–10, 1927. The following countries were represented:—Australian Commonwealth, Belgium, Dominion of Canada, Denmark, Dutch East Indies, France, Germany, Gold Coast, Great Britain, Japan, Greece, Holland, Hungary, Ireland, Italy, Luxembourg, Dominion of New Zealand, Norway, Poland, Roumania, Russia, Spain, Sweden, Switzerland, United States of America.

There were present representing Great Britain Mr. D. N. Dunlop, chairman of the International Executive Council and chairman of the British National Committee; Mr. L. B. Atkinson, member of the British National Committee; Mr. R. T. Smith, member of the British National Committee and of the Technical Committee, Fuel Conference, 1928; Dr. E. W. Smith and Mr. E. J. Fottrell, Joint Technical Secretaries of the Fuel Conference, 1928; Mr. M. W. Burt, Secretary of the International Executive Council and Joint General Secretary of the Fuel Conference, 1928.

A number of most interesting conversations took place between the British and foreign representatives regarding the technical programme for the Fuel Conference, 1928. It was evident from these conversations that the technical programme had been very favourably received, and that the Fuel Conference had already aroused widespread international interest.

Dr. E. W. Smith, Joint Technical Secretary, in addressing a special meeting on September 10, said that, speaking on behalf of the British Committee, the technical programme was only to be regarded as indicating the scope of the Conference, and was not the programme of papers. The British Committee does not wish to dictate regarding individual contributions, but it is hoped as the result of the conversations with international representatives that it will be possible to decide what contributions should be made by each country. If each country were to attempt to cover the whole programme, the Conference would be far too large. Germany, for instance, is interested in most fuel problems, but it is suggested that she should concentrate on questions on which she is specialising, such as gas distribution, utilisation of lignite, carbonisation under static means, etc. France might specialise, for instance, on the production of alcohol. Spain is anxious to become independent of other countries for her fuel supplies, and it would be most interesting to hear how she proposes to do this. Each country has its own problems and its own specialist subjects, and it is hoped that each country will make its own essentially national contribution, with the object of pooling knowledge and experience internationally. Each country was invited to submit to the British Committee a skeleton of each paper they proposed to present for a preliminary exchange of views regarding the subject-matter. The paper itself would probably have to be written by an individual, but should receive the careful

scrutiny of the representative body under whose authority it was to be issued, to the exclusion of all proprietary and specialised individual opinions. The desire of the British Committee to receive suggestions from all interested countries was emphasised, but as in some cases these may be of a conflicting character, it will be necessary for the British Committee to sift these suggestions before deciding, in consultation with other countries, what line of action should be adopted. The Conference is not to be a theoretical Conference, but it is hoped that it will be of a thoroughly practical nature, based on sound technical lines directly related to practical economics.

The Volta Solemn Commemoration was held on Sunday, September 11, and a telegram was sent to H.M. The King of Italy, and to the Prime Minister, H.E. Benito Mussolini, couched in the following terms:—“The International Executive Council of the World Power Conference, representing forty-five countries, assembled at Cernobbio, send greetings and desire to pay homage to Volta, the great Italian, whose name is for ever associated with the birth of the electrical age, and whose discoveries and high ideals have so largely contributed to the progress of mankind. Long may Italy produce such benefactors. Dunlop, Chairman.”

University Students at the B.D.C.

Last week a number of chemical students from different British universities terminated a month spent in the Blackley works and laboratories of the British Dyestuffs Corporation, Ltd. According to the *Manchester Guardian*, one of them said, in an interview: “It has been a valuable experience which none of us would desire to have missed, and we could wish that other large firms with chemical interests would follow the example of the British Dyestuffs Corporation. We have had practical experience in the workshop as well as the laboratory, which will be immensely helpful to us in our future studies.”

Active Carbon

A company has recently been registered in London under the name of “British Carbo-Union, Limited,” to take over and develop in the British Empire (excluding Canada) the patents and processes of the following firms, for the manufacture and use of active carbon:—The I.G. Farbenindustrie Aktiengesellschaft, Leverkusen; the Metallbank und Metallurgische Gesellschaft Aktiengesellschaft, Frankfurt, a.M.; the Urbain Corporation, New York, U.S.A., and Paris; and the Verein für Chemische und Metallurgische Produktion, Karlsbad. This company will be principally engaged in developing the use of active carbon for the recovery of solvents in air and gas mixtures, considerable commercial experience in which has already been gained on the Continent, where a number of plants operating under the Bayer and Urbain processes are at work. It is also proposed later to erect plant for the manufacture of active carbon for absorption and decolorising purposes. The address of the company in London is Astor House, Aldwych, W.C.2.

Sources of Vitamins A and D and Margarine Manufacture

In a letter published in *Nature*, Messrs. O. Rosenheim and T. A. Webster discuss sources of supply of vitamins A and D, and point out that the liver fats of

sheep, calf and ox contain on an average as much as 10 times the amount of vitamin A as a good Newfoundland cod-liver oil. These fats may be said to contain from 200 to 1000 times more vitamin A than butter, and not only are they free from the flavour of fish oils, but they are easily incorporated into other fats such as margarine. Vitamin A, being fat-soluble, can be extracted from the tissue by a neutral oil, though isolation might not be necessary in large-scale manufacture. The body fats of certain fishes, free from vitamin A, were found to be a good source of vitamin D, but the authors observe that there is no need to search for natural sources of vitamin D, as it can now be produced by irradiation of ergosterol. Irradiated ergosterol is extraordinarily potent, so that the amount to be incorporated into margarine would be extremely small. By a study of the best conditions for its formation in yeast, a practically unlimited supply of ergosterol should be available. The authors conclude by pointing out that margarine manufacturers have means at their disposal which should make it possible not only to supply a perfect biological substitute for butter, but a product of constant vitamin content, superior in this respect to natural butter.

Presentations by the Washington Chemical Co., Ltd.

On September 24 last five employees of the above company whose total service amounted to 190 years, an average of 38 years each, were presented with gold watches and chains in recognition of their long service. Since these members of the company had first commenced work in it many changes had occurred. The output of magnesia had increased 150-fold, and during the whole period of their service they had had constant employment in one branch or another of the company's works. Among the new industries that had come within the company's scope was cork insulation, of which the company made several thousand tons a year, insulating bricks, carbonic acid gas in a liquid form for refrigeration and magnesia insulation for high temperature surfaces, all products which the company was now supplying.

Subsidence at Ontario Nickel Mine

A subsidence has occurred at the Worthington mine of the Mond Nickel Company in Ontario, a cavity 400 ft. square and some hundred feet in depth having been formed. The power plant and various buildings are reported to have been engulfed.

State-aided Research in Australia

The Australian Budget, which shows a surplus of £2,635,000, includes the sum of £250,000 for research in science and industry and £100,000 for the purchase of radium.

The Austrian Chemical Industry

A report contributed by Herr Josef Brunner to the "Oesterreichische Chemikerzeitung" gives a fair idea of the state of the Austrian chemical industry in 1926.

In Austria the heavy chemical industry is much more fit for expansion than the fine chemical industry. The latter depended, before the war, upon the Bohemian heavy chemical industry, a connexion which is difficult now. After the war the various Succession States tried

to establish chemical industries of their own. In Austria, too, chemical factories have been erected. As some of the larger factories fell to Succession States with only poorly-developed industry, they were forced to work for export trade. This is the reason why the following goods are imported into Austria:—Methyl alcohol, caustic soda, etc. (from Yugoslavia, Rumania); ammonium sulphate from Poland; aluminium oxide from Yugoslavia; superphosphate from Yugoslavia, Poland, etc.

On the whole, importation of chemicals has decreased and exportation has increased.

Thus imports of concentrated hydrochloric and sulphuric acids fell by 50% since 1924. There are practically no imports of acetic acid, but considerable exports. Imports of aluminium sulphate in 1926 were reduced to 5% of that imported in 1924 (200 truckloads), and for potassium nitrate the imports were one tenth that of 1924. Imports of ammonium carbonate were very small, but exports were large.

In the hydrogen peroxide industry, Austria has had a leading position for many years: the export in 1926 exceeded that of the preceding year. Ammonium sulphate exports were more than double those of the preceding year. Artificial resins and horn were largely exported; the import is very small.

Although the relation of the export and import trade is mostly favourable to Austria, the position of the Austrian chemical industry is difficult, owing to competition for the world's markets. Austrian trade in chemicals is suffering from the fact that there are now more dealers in these goods than there were in the whole Austro-Hungarian Monarchy before the war, although only a quarter are now remaining of the 200 firms which were active in the time of the monetary inflation.

Austrian Aluminium Industry

The Lend (Salzburg) branch of the Neuhausener Aluminium-Industrie A.-G. (Switzerland) has been annexed to the European Aluminium Trust, and the second Austrian aluminium factory, Stern & Hafferl A.-G., at Steeg, is reported to be negotiating about joining the trust. The annual production of these factories (chiefly Lend) amounts to 3000 metric tons.

As far as calcined aluminium oxide is concerned, Lend depends on foreign countries. Stern & Hafferl owns a bauxite deposit and a calcination plant. The bauxite found in Austria is of inferior quality, and the industry is affected by the fact that Istrian export has recently been closed by the Italian Government.

Austrian Magnesite Industry

The Austro-American Magnesite Company Ges.m.b.H. in Radenthein (Carinthia) has been amalgamated with the Allgemeine Automobil A.-G., in Vienna, which is closely connected with the Wiener Bankverein. The Company has been converted into a limited company.

The Austrian magnesite industry includes the following works:—(1) The Radenthein works own quarries in the Millstatt Alps. The works are situated in Radenthein. The "Heraklit" factory is in Ferndorf (Drau Valley). Altogether, these employ 800—1000 workmen; a colliery attached, producing 20,000 tons a year, employs 150 men. The works manufacture sintered magnesite to be used for smelting works, magnesite stones, caustic magnesite for

xylolith flooring, "Heraklit" plates, and building plates. The production nearly equals that of the Veitsch Magnesite Works. (2) The Veitscher Magnesitwerke A.-G. owns the Veitsch, Trieben, Breitenstein and Eichberg works; they mostly produce sintered magnesite. (3) The Steirische Magnesit-Industrie A.-G. have their works in Neuberg, Oberdorf and Kraubath. They are partially closed down.

90% of Austrian sintered magnesite is exported. In 1925 the export amounted to 80,000 metric tons, *i.e.*, two thirds of the pre war export. As Austrian magnesite is especially suitable—it is said to be the best—for metallurgical purposes, neither the high import duties of the U.S.A. nor the new deposits found in that country have been able to hinder the Austrian export. In fact, the magnesite industry is the most important exporting industry of Austria.

An Enquiry

A correspondent wishes to obtain a protective coating for zinc sheet which will stand immersion in petrol for three months or more; no heat can be used when applying it. Replies should be addressed to the Editor, CHEMISTRY AND INDUSTRY, Central House, Finsbury Square, London, E.C.2

REVIEW

THE MAKING OF A CHEMICAL. By E. I. LEWIS, M.A., B.Sc., and G. KING, M.Sc., F.I.C. Pp 288. London: Ernest Benn, Ltd., 1927. Price 12s 6d.

This excellent book should be in the hands of every young chemist, and in view of its moderate price there is no reason why it should not find a place even on the most modest bookshelf.

The aim of the authors, as stated in the introduction, is to give an insight into works practice and works conditions. The book has been primarily written for young chemists, but it might with advantage be read by those engaged in a technical capacity in almost any scientific industry, whilst there is also a message for the non-technical, particularly the many who as proprietors or directors are engaged in management.

The chemist who is already in industry will find much to interest him. He will probably disagree often with the authors on points of detail. Thus, he may consider the experimental mechanical workshop described quite outside the requirements of the average works, however necessary it may be in a large, highly organised concern with abundant resources corresponding to its numerous activities.

In the opening chapters, entitled "Preparation," the authors give some useful advice of a kind that is rarely offered to young chemists, at least in such a concentrated and attractive form. He is told what knowledge other than chemical he ought to possess. For example, he must be conversant with a fair amount of physics and mathematics. He should also acquire certain laboratory accomplishments, which, it is implied, should not be allowed to degenerate into mere hobbies (there is a shrewd dig at the gifted amateur glass blower who "finds occasion"). Further, not only should he be acquainted with some modern foreign languages, but he should also strive to maintain a high standard as regards his own

English composition. This latter piece of advice is refreshing in a book which, quite rightly, lays considerable stress on the "cold dollar" aspect. It is, as a matter of fact, characteristic of the general attitude of the authors, who have successfully endeavoured to emphasise the dignity and romance of a profession which, on their own showing, must inevitably be influenced mainly by monetary considerations.

The main part of the book is divided into two portions: Part 1, A chemical; its manufacture and cost; and Part 2, Power and plant. In Part 1 the research involved in the general development of a manufacturing process and the factors governing the market price of the product are examined. Emphasis is laid on the need of an adequate study of the literature prior to experiment, and on analytical control. Absence of these two important precautions almost invariably leads to high hopes and subsequent disillusionment, as we all learn at some time or another. Accurate sampling, which the authors feel to be rather a neglected art, is referred to in some detail.

The investigation proper is first treated from the point of view of its development in the laboratory. The beginner is warned against developing methods on the small scale, in glass apparatus and with simple methods of control, that are impracticable on the large scale where a large bulk of material reacts out of sight in metal pans accompanied by difficulties as regards corrosion, agitation, and temperature control. These are features of manufacture where experience alone is the only real teacher, but the authors in pointing out to the young chemist the kind of difficulties which are to be anticipated will probably succeed in inoculating him with that healthy scepticism which is essential in our profession.

After showing how the probable cost of a substance may be estimated as the result of laboratory and small-scale work, and the principles on which materials, labour and power are charged against the product, the authors pass to a consideration of the actual manufacturing process. This chapter can only deal with generalities, but although some old and experienced investigators may profess to find many trite sayings therein, there is much that will be new and informative to the beginner.

The chapters on the final selling cost of the finished article will prove useful to most young chemists. The facts involved are mainly ones which directly concern the "management" alone, but a proper appreciation of them by chemists is of the greatest utility. To some extent this appreciation may be the only difference between a good chemist and a good industrial chemist. Amongst other things it will explain to him (although it may not console him to know) how the cost of a product, including his own days of labour and nights of thought, may be (say) 4d. per pound when it leaves his hands, and 2s., or more, when it at length reaches the public, including about 9d. for package and handling, 3d. as profits for the wholesaler and 6d. for the retailer. It will not be surprising if many an aspirant to the chemical profession transfers his affections to the retail trade after reaching this point in the book.

Part 2, Power and Plant, contains a great deal of interesting information which we have not previously seen brought together within the covers of one book in

such a satisfactory form. There are chapters on the transport and measurement of materials and energy. Materials are also considered from the point of view of their resistance to strain and chemical action: their ultimate value as "scrap" is even touched upon. Distilling, condensing, evaporating, crystallising, filtration, drying, furnacing, grinding, and mixing are all dealt with in the latter sections. In these chapters the various items of plant are explained by simple diagrammatic treatment, which is much more instructive to the beginner than the scale drawings or photographs from a manufacturer's catalogue, usually considered adequate by authors who treat of these matters.

The book closes with an interesting glossary wherein are to be found brief notes on such varied subjects as first-aid, gaskets, glands, standard wire gauge, steam traps, and butt-welding.

It is obvious from what has been said above that the authors have managed to condense a great deal of matter within the boundaries of this little book; for readers who desire a more exhaustive treatment of the various subjects dealt with there are many references to more detailed sources.

This book will undoubtedly be read with interest and enjoyment by most chemists, while, to the young worker just entering chemical industry, it cannot be too highly recommended.

J. E. G. HARRIS

COMPANY NEWS

BRITISH PORTLAND CEMENT MANUFACTURERS, LTD.

An interim dividend has been declared on the ordinary shares of 5% actual, less tax, being the same as for last year.

HARBEN'S (VISCOSE SILK MANUFACTURERS), LTD.

The annual general meeting was held on September 29. Sir Charles Mandelberg, chairman, presided, and said that the company definitely emerged from its development stage during the year ended April 30 last, and not only confirmed its position amongst manufacturers of artificial silk yarn of the highest quality, but began production on a scale commensurate with the full capacity of its plant and machinery. Rather more than 9 tons of yarn was being produced per week. The technical, engineering, selling and commercial staff was highly efficient, and had been built up with a view to an increased output of 18 tons per week. The artificial silk yarn produced by the company was recognised as being equal in quality to the best makes, and the fact that it was so much stronger and had greater elongation was a further advantage. The demand for the company's "Matrix" yarn continued to increase. The technical and research departments were maintaining an alert and progressive policy. So well was the company's product already regarded on the market that practically the whole of the year's output had been sold, and large contracts had been entered into for delivery well into next year. The company should be in a position to pay off some of the preference dividend arrears before the end of 1927. (For the accounts, cf. CHEM. & IND., September 23, 1927, p. 862.)

ASSOCIATED DYERS AND CLEANERS, LTD.

An interim dividend of 8d. per share, less tax, has been declared on the ordinary shares.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS.

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s. £27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations; 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS.

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson. 1s. 4d.—1s. 6d. per lb. according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide. 2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark --5½d.—6½d. per lb.
Lump Black. —£35 per ton, barrels free.
Lead Hyposulphite. — 9d. per lb.
Lithopone, 30% £22 10s. per ton.
Mineral Rubber "Rubpron" £13 12s. 6d. per ton. L.O.R.
London.

Sulphur. — £9 - £11 per ton, according to quantity. Sulphur
Precip. B.P. — £47 10s. £50 per ton, according to
quantity.

Sulphur Chloride. — 4d. 7d. per lb., carboys extra.
Thiocarbamide. 2s. 6d. 2s. 9d. per lb., carriage paid.
Thiocarbamilide. 2s. 1d. 2s. 3d. per lb., according to
quantity.

Vermilion, pale or deep. — 6s. — 6s. 3d. per lb.

Zinc Sulphide. — 1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime. Brown, £9 10s. £10 per ton. Good demand.

Grey, £14 10s. — £15 per ton. Liquor, 9d. per gal.

Charcoal — £6 — £9 per ton, according to grade and locality.

Foreign competition severe.

Iron Liquor. — 1s. 3d. per gal. 32° Tw. : 1s. per gal. 24° Tw.

Red Liquor. — 9d. — 10d.

Wood Creosote. — 1s. 9d. per gal., unrefined.

Wood Naphtha. Miscible, 3s. 11d. 4s. 3d. per gal. Solvent,
4s. 3d. per gal.

Wood Tar. — £4 — £5 per ton.

Brown Sugar of Lead. — £40 15s. per ton.

TAR PRODUCTS

Acid Carbolie. — Crystals, 7½d. 8½d. per lb. Crude 60's,
2s. 4d. 2s. 5d. per gal.

Acid Cresylic. 99, 100. — 2s. 11d. — 3s. per gal. 97, 99.

2s. 4d. 2s. 5d. per gal. Pale, 95%, 2s. 2d. 2s. 3d. per gal.

Dark, 90%, 1s. 9d. 1s. 10d.; 95%, 2s. 1d. 2s. 2d. per gal.

Anthracene Paste. — A quality, 2½d. per unit. 40% — £5 per
ton; Anthracene Oil. Strained, 8d. 8½d. per gal.
Unstrained, 7½d. 8d. per gal.

Benzole. Crude 65's, 9½d. — 9½d. per gal., ex works in
tank wagons; Standard motor, 1s. 1½d. — 1s. 2½d. per gal.,
ex works in tank wagons; Pure, 1s. 5d. — 1s. 6d. per gal.,
ex works in tank wagons.

Toluole. 90%, 1s. 4d. 1s. 8d. per gal. Pure, 1s. 6d. —
2s. per gal.

Xylole. 1s. 3d. 1s. 10d. per gal. Pure, 2s. 5d. per gal.

Creosote. — Cresylic 20 24%, 10d. — 11d. per gal. Middle
Oil, 8d. — 9d. per gal. Heavy, 8½d. — 9d. per gal. Standard
specification, 7½d. — 7½d. per gal. ex works. Salty, 7d.
per gal., less 1½%.

Naphtha. Crude, 9d. — 10d. per gal. Solvent 90 160, 9½d.
10d. per gal. Solvent 95/160, 1s. 3d. — 1s. 4d. per
gal. Solvent 90 190, 9½d. 1s. 3d. per gal.

Naphthalene Crude. Drained Creosote Salts, £5 per ton.
Whizzed or hot pressed, £8 per ton.

Naphthalene. Crystals, £11 10s. £13 10s. per ton. Flaked,
£12 10s. £13 per ton.

Pitch, medium soft. — 84s. — 90s. per ton, f.o.b. according
to district. Market firm.

Pyridine. — 90/140. — 5s. 9d. — 6s. 6d. per gal. 90/180. 4s. 6d. —
5s. per gal. Heavy. — 4s. — 4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices
include packages except where otherwise stated.

Acid Gumma. — 4s. 9d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.) 10s. 9d. per lb.

Acid H. — 3s. per lb.

Acid Naphthionic. — 1s. 6d. per lb.

Acid Neville and Winther. — 4s. 9d. per lb.

Acid Sulphanilic. — 8½d. per lb.

Aniline Oil. — 7½d. per lb., naked at works.

Aniline Salts. — 7½d. per lb., naked at works.

Anthranilic Acid. — 6s. per lb., 100%.

Benzaldehyde. — 2s. 3d. per lb.

Benzidine Base. — 3s. 3d. per lb. 100% basis d/d.

Benzoic Acid. — 1s. 8½d. per lb.

o-Cresol 29/31° C. — 5½d. per lb.

m-Cresol 98/100%. — 2s. 7½d. per lb.

p-Cresol 32/34° C. — 2s. 8½d. per lb.

Dichloraniline. — 2s. 3d. per lb.

Dimethylaniline. — 1s. 11d. per lb.

Dinitrobenzene. — 9d. per lb., naked at works. £75 per ton.

Dinitrochlorobenzene. — £84 per ton d/d.

Dinitrotoluene. — 48/50° C. — 8d. per lb., naked at works.

Dinitrotoluene. — 66/68° C. — 9d. per lb., naked at works.

Diphenylamine. — 2s. 10d. per lb. d/d.

α-Naphthol. — 2s. per lb. d/d.

β-Naphthol. — 11d. — 1s. per lb. d/d.

α-Naphthylamine. — 1s. 3d. per lb.

β-Naphthylamine. — 3s. per lb.

p-Nitraniline. — 1s. 8d. per lb.

m-Nitraniline. — 3s. per lb. d/d.

o-Nitraniline. — 5s. 9d. per lb.

Nitrobenzene. — 6d. per lb., naked at works.

Nitronaphthalene. — 1s. 3d. per lb.

R. Salt. — 2s. 2d. per lb.

Sodium Naphthionate. — 1s. 8½d. per lb. 100% basis d/d.

o-Toluidine. — 7½d. per lb.

p-Toluidine. — 2s. 2d. per lb., ex works, naked.

m-Xylidine Acetate. — 2s. 6d. per lb. 100%.

N.W. Acid. — 4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80% — £39 per ton, ex wharf London, in
glass containers.

Acid, Acetyl Salicylic. — 2s. 3½d. 2s. 5d. per lb.

Acid, Benzoic B.P. — 2s. — 2s. 3d. per lb. for synthetic product,
according to quantity. Solely ex Gum — 1s. — 1s. 3d. per
oz., according to quantity.

Acid, Boric B.P. — Cryst. 40s. 43s. per cwt. Powder
44s. — 47s. per cwt., according to quantity. Carriage
paid any station in Great Britain in ton lots.

Acid, Camphoric. — 19s. — 21s. per lb.

Acid, Citric. — 1s. 6½d. — 1s. 7d. per lb. Less 5%.

Acid, Gallic. — 2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst. — 7s. 3d. per lb. Resublimed. — 8s. 3d.
per lb.

Acid, Salicylic. — B.P. pulv. 1s. 2½d. — 1s. 3½d. per lb. Technical
11½d. — 1s. per lb. Good demand.

Acid, Tannic B.P. — 2s. 8d. — 2s. 10d. per lb.

Acid, Tartaric. — 1s. 3½d. per lb. Less 5%.

Anidol. — 9s. per lb. d/d.

Acetanilide. — 1s. 6d. — 1s. 8d. per lb. for quantity.

Amidopyrin. — 8s. 6d. per lb.

Ammon. Benzoate. — 3s. 3d. — 3s. 6d. per lb., according to
quantity.

Ammon. Carbonate B.P. — Lump £37 per ton, Powder £39
per ton, in 5-cwt. casks. Resublimed. — 1s. per lb.

Atropine Sulphate. — 9s. 6d. per oz.

Barbitone. — 5s. 9d. — 6s. per lb.

Benzonaphthol. — 3s. 3d. per lb.

Bismuth Carbonate. — 9s. 9d. — 9s. 10d. per lb. Bismuth
Citrate. — 9s. 6d. — 9s. 9d. per lb. Bismuth Salicylate. —
8s. 9d. — 9s. per lb. Bismuth Subnitrate. — 7s. 9d. —
8s. per lb. Bismuth Nitrate. — 5s. 9d. — 6s. per lb.
Bismuth Oxide. — 13s. 9d. — 14s. per lb. Bismuth Sub-
chloride. — 11s. 9d. — 12s. per lb. Bismuth Subgallate. —
7s. 9d. — 8s. per lb. Extra and reduced prices for
smaller and larger quantities respectively; Liquor
Bismuthi B.P. in W. Qts. — 1s. 1d. per lb.; 12 W. Qts.
— 1s. per lb.; 36 W. Qts. — 11½d. per lb.

Borax B.P. — Crystal 24s. — 27s. per cwt. Powder 20s. — 20s.
per cwt., according to quantity, carr. paid any station in
Great Britain in ton lots.

Bromides. — Ammonium. — 2s. 2d. — 2s. 3d. per lb. Potassium,
1s. 9½d. — 1s. 10½d. per lb. Sodium. — 2s. — 2s. 1d. per lb.

Granulated $\frac{1}{2}$ d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. $2\frac{1}{2}$ d.—1s. $4\frac{1}{2}$ d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. $7\frac{1}{2}$ d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10 $\frac{1}{2}$ d.—1s. $1\frac{1}{2}$ d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perochloride.—20s.—22s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2 $\frac{1}{2}$ %. Heavy Commercial £21 per ton, less 2 $\frac{1}{2}$ %; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb.; Levig., 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.; Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.

Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonat.—8s. 9d.—9s. per lb.

Metal.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate, 99/100% (Cream of Tartar) 98s. per cwt., less 2 $\frac{1}{2}$ %.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included, F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. $7\frac{1}{2}$ d.—1s. 9d. per lb. Crystal, 1s. $8\frac{1}{2}$ d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonat.—6s. 9d.—7s. per lb.

Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (*ex Anethole*).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 3d. per lb.

Coumarin.—9s. 9d. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—17s. 9d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—2s. 10d. per lb. Bergamot.—28s. per lb. Bourbon Geranium.—14s. 6d. per lb.

Camphor.—75s. per cwt. Cananga, Java, 18s. per lb. Cassia, 80/85%—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 10d. per lb., e.i.f. U.K. port, for shipment over 1928. 1s. $7\frac{1}{2}$ d. prompt shipment from Java. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 6d. per lb.

Eucalyptus, Australian 2s. 3d. per lb. Lavender, Mont Blanc, 28/40%, 17s. 6d. per lb. Lemon.—7s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—9s. 3d. per lb. Peppermint—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 6d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Nov. 29th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Oct. 13th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Alexander. Filters. 24,563. Sept. 19.
Blamey. Centrifugal extraction of slimes etc. 24,572. Sept. 19.

Bohme A.-G. Increasing wetting etc. capacity of liquids. 24,778. Sept. 20. (Ger., 27.5.27.)

Burch, and Metropolitan-Vickers Electrical Co. Vacuum distillation. 24,893. Sept. 21.

Gunka. Furnaces. 24,889. Sept. 21.

Heasman. Centrifugal separators. 25,095. Sept. 23.

Imray (I.-G. Farbenind.). Manufacture of metal catalysts. 24,636. Sept. 19.

Jambon. Furnaces. 24,837. Sept. 21. (Fr., 31.5.27.)

Johnson (I.-G. Farbenind.). Carrying out exothermic gas reactions. 25,110. Sept. 23.

Pay. Lubricant. 24,755. Sept. 20.

Stewart & Co. (Mauss). Cake washing means for rotary drum filters. 25,243. Sept. 24.

I. Complete Specifications

7330 (1926). Ljungstrom. Furnaces. (277,396.)

12,720 (1926). Dessauer. Apparatus for analysing substances by means of Röntgen or cathode rays. (253,090.)

23,461 (1926). Southall. Separation of solids from liquids. (277,500.)

2206 (1927). Levy. Granules for the absorption of gases. (277,540.)

2921 (1927). Vallez. Filters. (277,546.)

6699 (1927). I.-G. Farbenind. Manufacture of emulsions. (267,534.)

14,527 (1927). Schendt. Bag filter. (272,209.)

*22,403 (1927). Vereinigte Schweizerische Rheinsalinen. Salt or evaporating pans. (277,639.)

*22,782 (1927). Allgem. Elektrizitäts-Ges. Potentiometric devices. (277,645.)

*23,993 (1927). Trent Process Corp. Treating materials. (277,660.)

II. Applications

Anglo Persian Oil Co., Ltd. (Jameson). Treatment of hydrocarbon gases. 24,739. Sept. 20.

Arnold (Standard Development Co.). Conversion of hydrocarbon oils into lighter oils. 25,055. Sept. 22.

Asiatic Petroleum Co., Ltd., and Barton. Motor fuels. 24,906. Sept. 21.

Broué and Stevens. Hydrogenation of shales etc. 24,921. Sept. 21.

Carbide & Carbon Chemicals Corp. Making absorptive carbon etc. 25,130. Sept. 23. (U.S., 25.5.27.)

Daniels. Production and activation of carbon. 25,045. Sept. 22. (U.S., 22.9.26.)

France. Plants for washing coal etc. 24,896—7. Sept. 21. (Belg., 24.2.27 and 4.3.27.)

Ges. für Teerverwertung, Spilker, and Zerbe. Splitting hydrocarbons etc. 24,861, 24,915—6. Sept. 21. (Ger., 23.9.26, 18.10.26, and 20.10.26.)

Johnson (I.-G. Farbenind.). Low-temperature carbonisation of fuels. 24,644. Sept. 19. Production of oils of high viscosity etc. 24,647. Sept. 19. Bleaching montan wax. 25,003. Sept. 22.

Lucas, and V.L. Processes, Ltd. Cracking of liquid hydrocarbons. 24,974. Sept. 22.

Patent Aktiebolaget Grondal-Ramén. Dry distillation of shales. 25,271. Sept. 24. (Sweden, 7.10.26.)

Perehis. Treatment of mineral oils by heat. 25,033. Sept. 22. (U.S., 23.9.26.)

III.—Complete Specifications

14,468 (1926). Bianchi and Guardabassi. Apparatus for cracking, catalysing, and hydrogenating carbonaceous materials. (277,404.)

15,085 and 19,821 (1926). Lamplough and Hodgson. Treating oil and coal and the production of liquid hydrocarbons. (277,419.)

3903 (1927). I.-G. Farbenind. Decomposition of gaseous or vaporous hydrocarbons by means of water vapour. (265,989.)

6809 (1927). Bamag-Mequin A.-G., and Heller. Low-temperature distillation. (268,745.)

11,657 (1927). I.-G. Farbenind. Pulverulent fuels for internal-combustion engines. (270,703.)

*252 (1927). Gasifier Co. Gasifying liquid fuels. (277,604.)

*23,992 (1927). Trent Process Corp. Dissolving coal. (277,659.)

III.—Complete Specifications

15,048 (1926). Wittek. Extracting neutral oils from tar, tar-oil, or pitch. (256,933.)

15,085 (1926). Lamplough and Hodgson. See II.

*13,122 (1927). Still. Recovering sulphuric acid from acid-tar of benzol purification. (277,619.)

IV.—Applications

Carmael (I.-G. Farbenind.). Reduction of organic nitro compounds of the anthracene series. 25,049. Sept. 22. Manufacture of azo-dyestuffs. 25,050. Sept. 22.

IV.—Complete Specifications

7328 (1926). Bucherer. Production or development of azo-dyes. (249,526.)

9433, 10,632, 10,739 (1926) and 746 (1927). Wylam, Harris, Drescher, Thomas, and Scottish Dyes, Ltd. Dyes and dyeing. (277,398.)

17,655 (1926). Soc. Chem. Ind. in Basle. Manufacture of a dyestuff. (256,205.)

25,954 (1926). I.-G. Farbenind. Manufacture of stable preparations of vat-dyestuffs. (259,999.)

28,782 (1926). I.-G. Farbenind. Manufacture of anthraquinone nitriles. (261,422.)

29,276 (1926). I.-G. Farbenind. Manufacture of pyrazolone-azo-dyestuffs. (261,770.)

11,728 (1927). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (270,348.)

*24,216 (1927). I. G. Farbenind. Manufacture of benzanthrone-carboxylic acids. (277,670.)

V.—Applications

Carmael (I.-G. Farbenind.). Manufacture of copper oxide ammonia cellulose solutions. 24,903. Sept. 21.

Donagemma. Manufacture of cellulose threads etc. 24,672 and 24,948. Sept. 19 and 22.

Duke. Treatment of fibres for manufacture of paper etc. 25,165. Sept. 23.

Mourlaque. Manufacture of paper. 25,193. Sept. 24.

Stabner. Manufacture of coloured cellulose etc. 25,063. Sept. 22. (U.S., 23.9.26.)

Weingand, and Wolff & Co. Production of cellulose. 24,776. Sept. 20. (Ger., 19.4.27.)

V.—Complete Specifications

*20,012 (1926). Clavel. Treatment of artificial silks. (277,602.)

*18,255 (1927). Rheinische Gummi- und Celluloid-Fabrik. Treating celluloid scrap. (277,626.)

*23,383 (1927). Zimmerli. Lubricants for textile fibres or threads. (277,649.)

VI.—Applications

Balut. Dyeing hair of a pelt. 25,124. Sept. 23.

Hill. Production of finishing effects on textile fibres etc. 24,846 and 24,945. Sept. 21 and 22.

VI.—Complete Specifications

6720 (1926). Johnson (I.-G. Farbenind.). Increasing wetting and cleaning power of liquids for treating fibrous materials. (277,391.)

7328 (1926). Bucherer. See IV.

9433 (1926). Wylam, Harris, Drescher, Thomas, and Scottish Dyes, Ltd. See IV.

22,985 (1926). I.-G. Farbenind. Dyeing cellulose esters and ethers. (258,611.)

VII.—Applications

Alcock, Weber, and Laporte, Ltd. Manufacture of phosphoric acid etc. 25,022. Sept. 22.

Brégeat. Manufacture of potassium carbonate etc. 25,062. Sept. 22.

Coulter and Goldschmidt. Production of nitrogenised metallic compounds. 24,789—90. Sept. 20. (Belg., 20.9.26.)

Fischer. Radioactive material. 24,881 and 25,042. Sept. 21—22. (Austria, 29.9.26 and 19.2.27.)

Johnson (I.-G. Farbenind.). Production of solid calcium cyanide etc. 24,645. Sept. 19. Production of formates. 24,646. Sept. 19.

Laporte, Ltd. (Schlaugk Ges.). Manufacture of sodium sulphide. 24,910. Sept. 21.

Scailles. Manufacture of alumina. 24,637. Sept. 19. (Fr., 18.9.26.)

VII. — Complete Specifications

1601 (1927). Soc. Chim. Usines du Rhône. Treating acetic-acid liquor. (266,684.)

6477 (1927). Kyber. Simultaneous manufacture of iron phosphide and fused cement. (267,518.)

*13,122 (1927). Still. *See* III.

*18,623 (1927). Oesterr. Chem. Werke. Manufacture of stable solutions of peroxides, persalts, and peracids. (277,628.)

*22,403 (1927). Vereinigte Schweizerische Rheinsalinen. *See* I.

*23,650 (1927). Siemens & Halske A.-G. Production of ozone. (277,651.)

*24,637 (1927). Scailles. Manufacture of alumina. (277,697.)

*24,789—90 (1927). Goldschmidt and Coulter. Production of nitrogenised metallic compounds. (277,714—5.)

VIII.—Application

Lang. Abrasive. 25,014. Sept. 22.

IX.—Applications

Ackermann. Manufacture of bricks. 25,074. Sept. 23. (Ger., 31.12.26.)

International Copperclad Co. Building-material etc. 25,067. Sept. 22. (U.S., 5.10.26.)

IX.—Complete Specification

6477 (1927). Kyber. *See* VII.

X.—Applications

Ashcroft. Metallurgy of ores etc. containing tin. 24,649. Sept. 19.

Coles. Sherardising. 24,566. Sept. 19. Protection of metallic surfaces from corrosion. 24,567. Sept. 19.

Coulter and Goldschmidt. 24,789—90. *See* VII.

Gruber, Rohn, Weber, and Vacuumsmelze Ges. Metallurgical process. 24,994. Sept. 22.

Ott. Manufacture of steel. 25,168. Sept. 23.

Schorn. Aluminium alloys. 24,661—2. Sept. 19. (Ger., 18.9.26.)

Zimmer. Manufacture of gold leaf. 25,117. Sept. 23.

X.—Complete Specifications

14,959 (1926). Speichert. Treating lead-tin alloys derived from waste material from lead-smelting works. (253,908.)

15,037 (1926). Cumberland. Prevention of corrosion. (277,417.)

18,752 (1926). Jessup. Electrolytic manufacture of magnesium and alkaline-earth metals. (256,241.)

25,863 (1926). Siemens & Halske A.-G. Apparatus for galvanic processes, particularly for chrome-plating. (276,610.)

709 (1927). Browne. Producing high-grade silicon iron. (277,537.)

2224 (1927). Schubert and Pletsch. Tunnel annealing-furnace. (277,541.)

*22,496 (1927). Metallbank u. Metallurgische Ges. Production of aluminium or its alloys. (277,640.)

*24,661—2 (1927). Schorn. Aluminium alloys. (277,701—2.)

*24,789—90 (1927). Goldschmidt and Coulter. *See* VII.

XI.—Applications

D.P. Battery Co., and Waddell. Negative secondary-battery plates. 24,877. Sept. 21.

British Bead Printers, Ltd., Heynert, and Vredenburg. Electric-insulating compositions. 24,669. Sept. 19.

Hall. Electric accumulator. 24,794. Sept. 21.

XI.—Complete Specifications

18,752 (1926). Jessup. *See* X.

22,346 (1926). British Thomson-Houston Co., Ltd. Electric furnaces. (258,276.)

25,863 (1926). Siemens & Halske A.-G. *See* X.

11,353 (1927). Zimmermann. Production of insulating materials. (277,577.)

XII.—Applications

Canals. Treatment of oils and fats. 24,867. Sept. 21.

Nelles. Soap-making. 24,876. Sept. 21.

Pickersgill and Postnikoff. Margarine-making machines etc. 24,720—1. Sept. 20.

XII.—Complete Specification

6699 (1927). I.-G. Farbenind. *See* I.

XIII.—Applications

Higgins, and United Water Softeners, Ltd. Manufacture of mineral pigments. 24,765. Sept. 20.

Johnson (I.-G. Farbenind.). Manufacture of plastic compositions, lacquers, etc. 25,004. Sept. 22. Production of coloured compounds etc. 25,007. Sept. 22.

Wright. Luminous paint etc. 24,590. Sept. 19.

XIV.—Application

Goodyear Tire & Rubber Co. Accelerator of vulcanisation. 24,625. Sept. 19. (U.S., 8.10.26.)

XV.—Applications

Balut. 25,124. *See* VI.

Pawlowitsch. Tanning. 24,780. Sept. 20.

Röhm & Haas A.-G. Emulsions for tanning. 25,066. Sept. 22. (Ger., 13.11.26.)

XVI.—Complete Specification

9731 (1927). Prep. Indust. des Combustibles, and Hoffmann. Manufacture of phosphatic fertilisers. (269,199.)

XVII.—Application

Cuker and Komers. Increasing purity coefficient of diffusion etc. juices. 24,927. Sept. 21.

XVII.—Complete Specifications

10,236 (1926). Dehn (Penick & Ford, Ltd.). Manufacture of starch. (277,400.)

9736 (1927). Marks (Corn Products Refining Co.). Manufacturing starch. (277,572.)

XVIII.—Application

Sak. Production of compressed yeast. 24,751. Sept. 20.

XVIII.—Complete Specifications

20,875 (1926). International Yeast Co., Ltd. (Fleischmann Co.). Yeast manufacture. (277,476.)

*22,769 (1927). Henkel & Cie. Manufacture of a dry urease preparation. (277,644.)

XIX.—Applications

Pickersgill and Postnikoff. 24,720—1. *See* XII.

XIX.—Complete Specification

27,514 (1926). Douglas Pectin Corp. Pectin preparations and manufacture of preserves and jellies. (262,736.)

XX.—Applications

Delco-Light Co. Methyl ether. 25,182. Sept. 23. (U.S., 28.9.26.)

Germain. Distillation of organic calcium salts. 24,882. Sept. 21. (Fr., 23.9.26.)

I.-G. Farbenind. Making dihydroxyacetone. 24,909. Sept. 21. (Ger., 18,12,26.)

Johnson (I.-G. Farbenind.). Manufacture of methyl alcohol. 24,642. Sept. 19. Production of aldehyde sulphonylates. 24,643. Sept. 19. Production of aldol. 24,648. Sept. 19. Preparation of formaldehyde solutions. 25,002. Sept. 22. Recovery of products from oxidation products of hydrocarbons. 25,005. Sept. 22. Production of esters. 25,006. Sept. 22.

Merck. Production of a scopalamine preparation. 25,249. Sept. 21. (Austria, 11,10,26.)

Stephens (Wulffing) Manufacture of 2-phenylquinoline-4-carboxylic acid. 25,158. Sept. 23.

XX.—Complete Specifications

7051 (1926). Johnson (I.-G. Farbenind.). Manufacture of organic compounds. (277,394.)

17,561 (1926). Glucksmann. Manufacture of aqueous medicinal emulsions of paraffin. (255,456.)

15,197 (1927). Etabl. Poulenc Frères, and Pournau. Manufacture of a formyl derivative of 2 oxy-4-amino-phenyl-arsenic acid and salts thereof. (277,586.)

XXI.—Application

Ott. Composition for coating kinematograph films etc. 25,170. Sept. 23.

XXI.—Complete Specification

20,169 (1926). I.-G. Farbenind. Manufacture of photographic silver halide emulsions. (259,926.)

XXIII.—Applications

Hick, Hargreaves, & Co., Ltd. Means for deaerating water. 24,879. Sept. 21.

Higgins, and United Water Softeners, Ltd. Treatment of water by precipitation process. 25,093. Sept. 23.

I.-G. Farbenind. Preparations for repelling gnats etc. 24,762. Sept. 20. (Ger., 20,9,26.)

Johnson (I.-G. Farbenind.). Process for destroying pests. 24,865. Sept. 21.

XXIII.—Complete Specifications

15,200 (1926). Boehringer. Production of disinfecting agents. (253,918.)

*24,752 (1927). I.-G. Farbenind. Preparations for repelling gnats etc. (277,710.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Glass cloth (253); Water turbines and alternators (B.X. 3829). *Austria*: Soaps, india-rubber articles (261). *British India*: Optical goods, glassware, stationery, soaps (254); Steel, air lift pumps, oil engine driven compressor, receiver, oil tanks, well tubes, tools, steel sleepers and steel keys, disinfectors, boilers, steel crank axles for locomotives, paper, chrome steel crossings (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *British West Indies*: Cement, galvanised sheets, iron hoops (255). *Italy*: Sugar (269). *Japan*: Manganese metal, ferro tungsten, ferro titanium, manganese copper, phosphor copper (A.X. 5243). *New Zealand*: Soaps, stationery, rubber goods (258). *South Africa*: Internal combustion Diesel crude oil locomotives (A.X. 5229); Tallow (B.X. 3844); Disinfectant powder (B.X. 3846); Stone-crushing plant, including conveyor belt, endless

rope haulage, electric motors, etc. (A.X. 5263). *Switzerland*: Engineering metals (272). *Yugoslavia*: Tin (A.X. 5261).

Bisulphide of Carbon (Conveyance in Tank Wagons) Regulations, 1927

In pursuance of Section 9 of the Third Schedule of the Petroleum Act, 1926, the following regulations have been made amending the Bisulphide of Carbon (Conveyance) Regulations, 1927. (b):—(1) Bisulphide of carbon may be conveyed in tank wagons, subject to the provisions of these regulations. (2) The Bisulphide of Carbon Regulations, 1927, shall apply with the exception of Regulations 1, 2, 3, 4, 5, 12, and 14. (3) This section regulates the construction of such tank wagons. (4) The capacity of a tank wagon shall not exceed 1000 gals., this limitation being construed so as to permit the tank to contain the amount specified under varying conditions of temperature. Trailers shall not be employed with tank wagons. (5) During the filling or emptying of a tank wagon the following precautions shall be observed: (a) If the wagon is mechanically driven the engine shall be stopped the whole time the filling or emptying is proceeding, and shall not be run until all tanks have been securely closed. (b) If the wagon is horse-drawn, the horses shall be removed and the wheels securely scotched before filling or emptying is begun. (c) Adequate provision shall be made to prevent the accumulation of a dangerous static charge of electricity. (6) Bisulphide of carbon in cans or other packages shall not be conveyed on any tank wagon used for the conveyance of bisulphide of carbon. (7) This regulation lays down conditions to be observed if electric lighting is employed on any tank wagon conveying bisulphide of carbon. (8) The tank of any tank wagon conveying bisulphide of carbon shall be legibly marked with the words "Bisulphide of Carbon, Highly Inflammable." (9) These regulations may be referred to as the Bisulphide of Carbon (Conveyance in Tank Wagons) Regulations, 1927.

News from Advertisements

The following posts are vacant: (1) Inspector under the Alkali Works Regulation Act. (2) Chair of Organic Chemistry in the University of Sydney, New South Wales. (3) Junior assistant chemist under the Northern Coke Research Committee, Armstrong College, Newcastle-upon-Tyne. (4) Chemical engineer for Midland factory. (5) Junior assistant chemist for an Engineering Works Laboratory (p. vi).

Three vacant posts in the Industrial and Commercial Property Registration Office as examiners of applications for patents for mechanical engineering, electrical engineering, and chemical inventions, are announced by the Civil Service Commission, Dublin (p. vi).

Sets of the JOURNAL are for sale (p. vi).

There are now 118 firms represented in our Buyers' Guide.

EDITORIAL

Calorifer on Bone

WE have the best reasons for believing that CALORIFER, who has successfully concealed his identity by adopting a *nom de guerre*, has a profound admiration for the work done by Bone and Townend and for the book they have published on Flame and Combustion in Gases. The fact is that in our editorial capacity we naturally have been in communication with CALORIFER, and know who he is, though we shall duly respect his desire to remain anonymous. We cannot imagine him writing ten columns, filled with learning, jests, arguments, sarcasm, satire, poetry, verse and so on, revolving the matter round in his fertile and highly-charged brain, and entering into the lists prepared for any sort of mortal combat, unless he thought the book which has stirred him up was really a valuable contribution to knowledge. It is true that his admiration is tempered by keen criticism; on the other hand, his vigorous onslaught has the sting taken out of it by the airy touches of fancy which enable us to realise that when he describes a chemist, who may easily be identified, as a thrice-unhung villain, he really has a great respect for the worthy man. These modifications must be borne in mind and allowed for. Somebody said once, not of CALORIFER, "He was the mildest-mannered man that ever scuttled ship or cut a throat." Someone else wrote, "Perhaps you were right to dissemble your love, but why did you kick me downstairs?" CALORIFER is a stickler for precision in words, and recommends, as we do ourselves, the sparing use of such words as end in *osity* and *ate*. Quite right! but what about "epipedonic?" Why drag this in? The irreverent chemist called Henry would have dealt with him severely for such an innovation. We are glad that CALORIFER objects to "activate." We have an affection for Latin and Greek, but in their proper places: if a Latin or a Greek word will express a meaning more accurately and more concisely than an English one, and if it will be as accurately understood, let us have it by all means. There are, however, foreign, specially Greek words, used in science which are used to explain briefly that the writer is not clear in his mind what he does mean, and hopes that the reader will not detect this. On the use of the word "theory" we should like further enlightenment. CALORIFER tells us that "A theory is a complete doctrine, into which all the facts may be fitted." The only theory known to us in chemistry is "The atomic theory." We do not know why the word theory should have in chemistry a narrower meaning than it has in the writings of many careful men during

many years. The word is, we suppose, derived from the Greek, through the French. It originally meant a view, contemplation, speculation, spectacle. It corresponded closely in several of its senses with the word "view." It was not usually distinguished from opinion or hypothesis. An erroneous speculation was nevertheless a theory. Grote uses the word theory to describe what he calls elsewhere a hypothesis. Lyell, in his Principles of Geology, speaks of "visionary and fantastical theories" and the "theory" of Pythagoras concerning the destruction and renovation of the earth. Faraday, in commenting on M. Biot's opinion as to the cause of electro-chemical decomposition, says, "This theory implies that decomposition takes place at both poles upon distinct portions of fluid, and not at all in the intervening parts", on pages 76 and 77 of that very edition that CALORIFER advocates he will find an account of Faraday's "theory," M. de la Rive's "theory," and some other theories. So Darwin wrote of the theory of natural selection at a time when it was hardly more than an opinion. Rouse Ball writes of Maxwell's and "the other electric theories." We think, if we spent another half hour, we could find a profuse crop of examples taken from authors who wrote well and carefully. It is possibly a mistake to go back to the Greek meaning of Greek words when there may so easily be found the chemical meaning of the Greek. We must go cautiously and with sure steps and slow; this is, we suppose, what is meant by epipedonic progress. We remember the lines "Oh why did I learn mathematics or give my attention to Greek? That's the reason I'm lodging in attics and living on nothing a week." If we use the word "theory" as it has been used by the learned for two thousand years, it will include "view," or even "impression." There is something divine about a theory, probably theory and thionic have the first syllable in common, but there is nothing about it which need command our respect; the old theorist was probably merely the man who enjoyed the spectacle of the sacred games, the equivalent of the man who now watches a football match. CALORIFER almost tempts us to write something about flame; if we could spend an afternoon with him and another with the authors of the book he has praised, we might, perhaps, write two short notes, one for publication, the other to be handed round to those frivolous chemists who frequent the Savage Club. The lines we have quoted about mathematics and Greek will appeal to those chemists who write to us complaining of inadequate remuneration; if ten thousand men and women attained a reasonably high standard in mathematics, the pay of a mathematician would be very

low, unless the knowledge was supplemented by exceptional qualifications of another sort.

The New Stereochemistry

We have often tried to read up the stereochemistry of the simple carbon compounds, but have been foiled, partly by the lack of the necessary text-books and partly by a mixture of diffidence and laziness which has prevented us from taking due advantage of the information that has been published. We have frequently invited our readers to enlighten our darkness; we thought that a few of the four or five thousand of our readers who have this subject at their fingers' ends might very gladly give some elementary instruction to the four or five hundred who never knew this subject very well and have now forgotten most of what they once knew. We were disappointed that so few responded to our invitations; our disappointment has vanished, it has been replaced by a grim satisfaction that we have not worn out our feeble brain in an effort to understand both organic chemistry and solid geometry and then had to revise or correct a good deal of the result. For here comes Prof. Victor Henri, of Zurich, whom we have met and who appears to be a man with knowledge on such matters, and he tells us that we must abandon the axioms and postulates of stereochemistry and work out new theorems. He has duly pondered on the experimental evidence, concerning the structure of methane and methane derivatives, furnished by observations on the scattering of light, the absorption spectra, the structure of crystals as determined by X-rays, the potential energy of molecules and the emission spectra of atoms and molecules. He has experimented on about fifty different compounds in his own laboratory, and has compared his results with the work of Cabannes, Raman, Guillemin and Mark, almost all of which has been published in the last three or four years. His conclusions are that the molecule of methane is rectangular pyramidal in form and not tetrahedral, that the dichloro-derivatives of methane are tetrahedral, but the molecule of tetraphenylmethane is pyramidal. The component atoms of the water molecule are shown to be arranged at the corners of a triangle. Not content with shaking the foundations of organic chemistry in this way, Prof. Henri makes our flesh creep by arguing that the four valencies of carbon are not equivalent but consist of two different types, and that the molecule of methane is labile and capable of changing its form in its derivatives. We have an imperfect recollection that in the 'eighties and 'nineties we were taught to bind our molecules with chains and our atoms with links of iron, and that subsequent workers have calculated the stress on bending the links, their hardness and breaking point, and finally their tensile strength, and that you may find tables of the naperian logarithms of the cosines of the angles of distortion of these massive connecting rods. Prof. Henri will have none of this; he considers that the molecule is a mobile system of atoms in which the stability of the structure is determined by the minimum value of the potential energy. We can see the makings of a pretty quarrel between the physical chemists and the organic chemists. Have at ye, and God defend the right! We will not yet destroy our beliefs for so slight a cause; it is like burning down the house to kill the

beetles; but we do intend to postpone our projected course of study until we know whether we should enlist in the army of Prof. Henri or his opponents. We may say that a full account of his beliefs and his reasons in support will be found in the current number of *Chemical Reviews*, obtained from Messrs. Baillière, Tindall and Cox, the London agents of the American Chemical Society.

Greed and Egoism

We confess that when, frequently, we read the *Evening News*, we seldom fail to acquire much and varied information respecting social life of to-day, and not a few definite views on the political situation. Recently, however, we read something which rather upset us. We were called upon to admit that Science is as greedy as it is egotistical, that Science, up-to-date, has fortunately been more bombastic than successful, and that if we seriously annoy Nature by destroying insect and other pests, she will retaliate by wiping out man. After so scathing an indictment, we are relieved to think that we have always humbly protested when addressed as a "scientist," but we must nevertheless set to work immediately and re-examine our position. It is clearly a case of Nature *versus* Science, and we are safer on the side of the bigger battalions. Let us start with Newton's apple. Item, All this insistence on an universal law of gravitation is pure arrogance. The facts are simple enough; the apple just fell down, as all other things do when you drop them. Item, The maggot of the codling moth (if any) which was the immediate cause of so natural a phenomenon had as much right to that apple as Newton. Conclusions: Science may be tolerated so long as it does not conflict with nature, but greedy gravitation must not presume to try and make things full upwards; moreover, the morality of insecticides is in question. "Man," we learn, "gets 80% of the world's available supply of food, a far greater share than his own unaided efforts produce." This is only too true. Equity demands—and secures a proper agreement with *Bacillus nitrificans* and his friends. Rabbits and rats may not earn their daily bread—unless rabbit pie may be regarded as service rendered but that is no reason why they should be deprived of a suitable livelihood for themselves and their families. No. We must refuse to be "egged on by our scientific war-lords" to a class-war against the lower orders of the animal kingdom. "Nature can be won by kindness." Let our agricultural chemists turn over a new leaf. Let us prohibit insecticides, and spray our potatoes with molecules which will melt in the mouth of the potato bug; give the boll-weevil our hemstitched handkerchiefs to chew; see that our rats get plenty of irradiated ergosterol, and then, perhaps, losing their taste for the things man requires for his own use, they will live their lives in synthetic contentment, if they do not die of laughing. The *Evening News* doubtless intended to amuse rather than to instruct. We sincerely hope that its leading article will not mislead the thoughtless into the attitude which regards Science as the enemy, rather than the expression, of Nature, and that it will do nothing to encourage any neglect of the duty of controlling, even to the point of extermination by "shock troops and battalions of scientific death," the menace of insect pests and vermin.

THE LABOUR POLICY OF IMPERIAL CHEMICAL INDUSTRIES, LTD.

Sir Alfred Mond, M.P., chairman of Imperial Chemical Industries, Ltd., has explained, in a statement made at a Press Conference, the programme of the company in regard to workers in its employ. The reorganisation and the revival of British industry, said Sir Alfred, had been seriously retarded by industrial disputes, but gradually there had been growing in all directions the view, which would soon become a settled conviction, that the best interests of all concerned were best served by agreement and conciliation. The history of most of the industries now amalgamated in Imperial Chemical Industries, Ltd., had been a happy and peaceful one, and almost entirely free from industrial disputes. The relationship between the companies and its workers in the chemical industry had always been cordial. Those conducting it in the past had always regarded all those working with them in any capacity as fellow-workers in a common cause. In his first official announcement on the formation of the new company, he stated that "The formation of the new combination will not be allowed to alter that close personal contact which has happily existed for more than one generation between the chiefs of the industry and those employed with them. The good-will of all those engaged in the industry is one of the most valuable of invisible assets, and this is fully recognised by those who will control the future destiny of the British Chemical Industry."

In a subsequent official statement in December, 1926, Sir Alfred Mond said he endeavoured to define the labour policy of Imperial Chemical Industries, Ltd., in the following passage:—

"There has been a certain agitation or tendency to suggest that one of the objects of the merger is to depress wages and worsen the conditions of those employed in the respective companies. I want to give a most emphatic contradiction to that. Nothing could be more untrue. Quite the reverse is in the minds of those directing this enterprise. In fact, at an early date a careful study will be made of the various welfare and profit-sharing and bonus, or other schemes already existing in the constituent companies, with a view to ensuring that the future shall, if anything, be better than the past, and that those engaged in any rank in any of the works of this great Imperial enterprise shall obtain the greatest possible consideration and sympathetic treatment. In fact, the happy relations which have existed for so many years in the chemical industry, almost unique in the industries of this country, will, we confidently anticipate, not merely be maintained, but improved, and every endeavour will be made that contact will not be lost, by the mere size of the organisation, between those who are at the head and those who are giving their daily work in its many manufactories in whatever sphere."

No time had been lost in implementing this promise to introduce an Imperial Chemical Industries' Workers' Programme. Considerable investigations had been made and a great deal of time and thought had already been given by the Board to the formulation of this programme. To-day he was happy to be able to announce the details of the first instalment of the company workers' programme. In commencing a huge concern like this

there were many problems to think about, particularly in the earlier stages, and one they had to think about was the importance of the organisation of the labour position. For they had something like 40,000 workmen and workwomen spread through a large number of factories of different sizes throughout the length and breadth of the country.

During the last few weeks the movement towards industrial peace had received a great impetus. There was not only a new spirit, but there was also a new task in industry. The influences made themselves felt at the last sessions of the Trades Union Congress. He trusted that the concrete proposals which Imperial Chemical Industries, Ltd., had put forward would prove a lead to other companies and other industries.

To give effect to the purpose of having a common labour policy throughout all the works of Imperial Chemical Industries, a central labour department had been established. The Board attached the greatest importance to the unification of all labour matters, and that department and all labour questions would be under the personal direction of Mr. Henry Mond, who was an executive director of the combine. Mr. Mond would be assisted by Mr. R. Lloyd Roberts, the company's Chief Labour Adviser, who had for long been Secretary of the Chemical Employers' Federation. The department would be administered by specialists, and would have the assistance of an advisory committee to secure the necessary interchange of views between those who framed the policy and those who executed it. One of the problems that had occupied his mind in the reorganisation of the chemical industry was how it would be possible to maintain personal contact between those directing the industry and those employed.

Works councils would be set up in all the works of the combine, to provide a direct link with the Board of Chemical Industries. These works councils would be of three forms, and they would all be representative equally of the management and the workers. In the first place, there would be the Local Works Council, which would deal with all local matters affecting the workers. In the second place, there would be the General Works Council, appointed from and by the various Local Works Councils of all works under each group of companies. Its functions were similar to those of the Local Works Councils, but matters dealt with would be of a wider scope and of general interest to the workers of the whole group. Lastly, there was the Central Works Council, appointed from and by the General Works Councils, which would meet regularly in London. Over this body he himself would preside. He would thus be able to maintain that constant and close personal contact with the interests and operations of all the workers of the combine, and would be able to consult and discuss with them on all questions affecting their general well-being.

Another problem which affected all industrial relations was that of the status and security of the worker. By the system of works councils and by the inauguration of a staff grade of workers, any ground for complaint would be removed. All men of five years' service and over would be eligible for promotion to the staff, and those promoted would be paid a weekly wage instead of an hourly rate. To give greater security to their

employment, they would be entitled to receive a month's notice of termination of employment; they would be paid wages for bank holidays, whether worked or not; for all certified sick absence up to six months in any year they would be paid full wages, less National Health Insurance benefit. This staff grade might even consist of 50 per cent. of all workers of five years' service and over.

The co-partnership plans which had functioned in various of the companies were being unified in a Workers' Shareholding Scheme, which was designed to encourage all ranks of workers to obtain a direct financial interest in the company. Any employee might purchase ordinary shares in Imperial Chemical Industries, Ltd., at 2s. 6d. below the mean market price. All workers receiving wages of £200 a year or less would receive one free share for every four shares purchased. Workers receiving higher wages or salaries would receive a smaller proportion of free shares to those purchased. The maximum individual allotment would be such number of shares as could be purchased by an expenditure of a sum not exceeding 20 per cent. of the annual wages or salary of the employee. To this 20 per cent. might be added an additional 1 per cent. for each year of service above five. An employee with 20 years' service therefore might spend 25 per cent. of his wages or salary. If the worker should die before completing his payments, which might be by instalment, the company would take over his obligations and hand the shares, fully paid, to his next-of-kin. The shares were just such as the public could purchase in open market, and could be sold in the market like other shares.

The workers' shareholding scheme was intended as an investment scheme, and while no absolute restriction was placed on the workers, they would not be expected to speculate with their shares. The directors reserved the right to refuse to allot further shares to a worker who did not enter into the right spirit of the proposal.

Further, a monthly magazine would be established to keep their workers all in close touch and make them feel they were all working with the board and management for the prosperity of their industry.

These points were but the first instalment of the workers' programme of Imperial Chemical Industries. The keynotes were personal contact, improved status and security, co-partnership, and information. He did not consider this complete, but other proposals now being investigated and considered would be decided on the same broad lines.

Industrial peace would be created only by those responsible for industry and those responsible for labour accepting the position and working out schemes which would be of use to both parties and would give benefits to industry as a whole. The achievement of industrial peace could not be hastened by the desires of enthusiastic amateurs or disillusioned politicians. It could be secured only by the competence of those in whose hands was placed the responsibility for industrial reorganisation. There was a new spirit and a new science required in the management of industry. That they had endeavoured to apply to the chemical industry. That was the broad avenue to industrial prosperity and to industrial peace.

[Further details of the Labour Programme of Imperial Chemical Industries, Ltd., will be given in our next issue.]

SYNTHETIC DRUGS AND PHARMACOLOGY

At the opening of the thirty-sixth session of the School of Pharmacy of the Pharmaceutical Society, the Hanbury Medal was presented to Dr. T. A. Henry, F.R.S., director of the Wellcome Chemical Research Laboratories. In his address, Dr. Henry discussed the contribution of the Pharmaceutical Society to education and research. He welcomed the opening of a pharmacological laboratory by the Society. There was a consensus of opinion among pharmacists, manufacturers, and medical men that this country had not yet reached the position it ought to occupy as a producer of synthetic drugs. We had made great progress since the critical year 1914, both in the manufacture of synthetic drugs of established reputation as therapeutic agents and in the introduction of new products of this kind, but far too many of the new additions were of foreign origin. This was not a creditable state of things. We were as an Empire responsible for the well-being of an enormous tropical population, yet most of the important new drugs for the treatment of tropical diseases still came from abroad. This was probably due, in part at least, to the fact that as a nation we were naturally and primarily interested in the preventive rather than the curative side of medicine. This was as it should be, but it was no reason why we should not take our share in investigations which would produce new materials for dealing with disease. In practice there were many factors which weighed heavily against British activities in this direction, but one of the most important had been the lack of facilities for conducting pharmacological tests and therapeutical trials of new drugs. Scarcely a number of the *Journal of the Chemical Society* appeared which did not contain descriptions of new substances whose pharmacological action ought to be investigated.

Further, the number of chemists who were beginning to take an interest in the possible therapeutic value of substances they prepared was steadily increasing, but the number of centres at which the necessary pharmacological work could be done in Great Britain was lamentably small. Apart from this demand there were the requirements of the pharmaceutical branches of the fine chemical industry. We had had it clearly impressed upon us that an investigation leading eventually to the production of such a drug as "Salvarsan" implied the preparation of a large number of substances, and therefore the employment of many organic elements, but it did not seem to be as clearly realised that all this work required to be carried on under pharmacological control.

It was the same with much of the biochemical work which was now leading to the use in medicine of materials such as insulin. All this meant an increased demand for pharmacological work in the future in this country. Anyone who realised these needs must welcome the action of the Pharmaceutical Society in opening the new laboratory, not only for the immediate help it could give in connexion with the testing products of which came within the scope of the Therapeutic Substances Act, but for the fact that it was a new centre for training in experimental pharmacology, and that as it developed it might be able to give material assistance in some of the directions just mentioned.

A RECENT DEVELOPMENT OF SPRAY DRYING*

By J. ARTHUR REAVELL, M.I.Mech.E., M.I.Chem.E.

In all chemical works, and, to a large extent, in the manufacture of food products, the removal of water from various solutions and substances forms an intermediate step in most manufacturing processes. Very often this can be done by evaporation in evaporators of various kinds, but in many cases the use of any type of tubular evaporator, or of drum driers, is not feasible.

The problem now to be discussed, therefore, is another form of evaporation. In a previous paper† the author defined evaporation as "the use of heat to bring about the separation of a volatile liquid, generally water, from solids in solution." In the form of evaporation described in this paper air is used as the medium whereby the heat is conveyed to the liquid to be evaporated.

The production of chemical products, or food products in their ultimate dried form, usually as a powder, generally involves three processes:—

1. Evaporation.
2. Drying.
3. Grinding.

The liquid to be dealt with is usually taken into an evaporator in which it is concentrated up to a suitable density. It is then subsequently dried and finally ground before being ready for sale. In the spray drier that we describe these three processes are performed in one operation.

With very few exceptions, this plant is suitable for the dehydration of any material which can be obtained in the form of a solution, or a finely divided suspension, from which it is possible to obtain a solid residue by means of evaporation. This covers a vast field, and embraces problems which arise in almost every industry.

Materials that can be dealt with will be referred to under two distinct headings:

1. Materials that are stable, that is, substances which are not decomposed or damaged when heated to a temperature of 100° C.
2. Unstable materials, that is, those which are affected by being heated to a temperature of 100° C.

These arbitrary definitions are taken for the purpose of this paper only.

In order that spray drying plant may operate successfully three essentials must be fulfilled:—

The first is the atomisation of the liquid to be treated.—The liquid must be continuously dispersed in the form of small particles of uniform size. The direction taken by the dispersed particles must be under control, and any apparatus employed to produce these results must be capable of operating for long periods under ordinary working conditions.

The second relates to the drying of the dispersed particles.—For this it is necessary to provide means in the drying plant whereby the dispersed particles are rapidly and uniformly brought into contact with the drying air for a sufficient period to ensure that the dispersed particles do not reach any part of the vessel in which the

drying is being carried out until they are in the solid state.‡

The third relates to the removal of the dried product from the air stream.

The importance of the above three essential requirements will be appreciated more fully as we proceed to discuss the matter in greater detail. First of all we will deal with atomisation—a term frequently used in connexion with spray drying work, but which, of course, must not be taken literally.

JET ATOMISERS

The first attempts to atomise liquids were by means of various types of jet, the liquid being forced through the jet at high pressures. It was soon found that the only way to obtain a really finely divided dispersion was to employ extremely high velocities in the jet apertures. The usual designs of spraying jets are familiar, and for certain purposes they are quite efficient, but the dispersion required for spray drying is of a different order from that required in normal spraying operations, and

FIG. 1

considerable modifications in the jet design were necessary to obtain anything approaching the required results.

A jet which is probably the best of its type relies upon a minute orifice in a disc of specially hard metal through which the liquor to be atomised is forced at high pressures. Pressures of about 2000 lb. per sq. in. are employed, and under these conditions atomisation is obtained with a particle of a size which is sufficiently small for spray drying purposes.

With this type of atomiser, however, it is difficult to obtain the three essential conditions to which reference has been made. For instance, the spray leaves the jet in the form of a cone which spreads outwards, and it is difficult to mix the air thoroughly and rapidly with the sprayed particles. This will be discussed more fully when dealing with the methods employed to obtain efficient contact between the heated air and the atomised liquid, and, therefore, at this stage it is referred to only in passing.

To maintain the pressure of 2000 lb. per sq. in. in the jet presents considerable problems, particularly when the liquid under treatment is of a corrosive nature, or when it consists of foodstuff which must be uncontaminated during treatment. Again, the minute aperture

* Read at a meeting of the Chemical Engineering Group on Oct. 14, 1927.

† "Evaporation in the Chemical Industry," by J. Arthur Reavell, J.S.C.I., 1918, 27, 172 T.

in the jet disc is liable to obstruction by any trace of solid foreign matter in the liquid, and even if this should not occur the disc must be renewed frequently, as within a few hours the erosion caused by the liquid passing through the aperture is sufficient to increase its diameter materially.

With foodstuffs, which are usually of a relatively expensive nature, the question of cleaning is important. There is always a loss of material when the pumps and pipe lines are cleaned, and, in addition, there is always a loss at pump glands etc. during running.

Another difficulty is the variation in size of the particles leaving the disc aperture. If the flow of liquid through the aperture is considered, it will be obvious that its velocity will vary considerably across the disc diameter. This means that the condition of the liquid immediately after it leaves the orifice is not uniform, and therefore the sprayed particles cannot be uniform in size.

DISC ATOMISERS

This is a type of atomiser which operates on a totally different principle from that described above. In this type of atomiser use is made of the centrifugal force developed in a liquid which is rotated at high

FIG. 2

speeds. In order to make use of this some form of wheel or disc is arranged from which the liquid is projected at considerable velocities. One of the early forms consisted of a disc with a number of angular projections, the liquid being fed to the centre of the disc and leaving at the periphery. This type of disc has been developed in various ways. In place of the projections jets have been arranged round the periphery of a rotating cup, but this modification only leads us back to the jet type of atomiser which was considered first. Therefore

attention will be confined for the moment to the revolving disc arranged with projections from which the liquid is thrown.

This type of disc has many advantages over the jet. There are no small apertures to clog; it does not involve the use of high pressures, and cleaning is quite a simple matter. It is difficult, however, to get a fine and regular dispersion, as the film of liquid behind any one of the projections is naturally thicker than in the space between the projections, and particles of irregular size are

FIG. 3

invariably produced. It has its uses, particularly in dealing with solutions which contain suspended solid particles of irregular size.

We will now consider another type of disc which has been used successfully. It consists of a plain disc, which is rotated at a high speed about a vertical axis, the liquor to be atomised being applied in the centre of the disc. It was soon found that it was advantageous to work with a disc which is not flat across its upper surface, but which is hollowed toward the centre and raised at the outer edges. Greater adhesion of the liquid to the disc is obtained in this way, and the slip between the liquid and the atomising disc is thereby reduced.

This type of atomiser is simple, but its use is limited to spray-drying plants in which the liquid can be fed on the upper side of the atomising disc. It will be shown that there are great advantages in being able to atomise from the lower side of a rotating disc, the disc being driven from above.

The use of an underdriven disc is limited to a type of drying plant in which the dry air current moves in an upward direction. There are enormous advantages in drying with a downward current of air. Consequently considerable attention has been given to the design of an atomiser which is driven from above, and which can be situated in the upper part of a drying chamber.

In this case the driving spindle comes down to the centre of the disc and feed pipes are arranged around the spindle, directing the material into an annular cup, from which it passes outwards towards the edge of the disc. It is difficult with this type of atomiser to obtain

FIG. 4

a regular distribution of the liquid around the periphery of the disc, as there is a marked tendency for the liquid to leave the disc at positions dependent upon the position of the feed pipes, instead of forming a symmetrical film over its surface.

A recent design of disc has been evolved to overcome the various troubles associated with the types hitherto mentioned. The essential characteristic of this disc is that the liquor is sprayed from the underside, although the driving mechanism and the feed pipes are situated above the disc. It consists of a central ring in the outer

FIG. 5

periphery of which are a number of openings. These openings lead to the underside of a bell-shaped spraying disc. Above the bell-shaped portion and the central disc with its distributing openings a cup is formed into which the liquor is fed. The centrifugal force which is developed in this cup propels the liquid through the distributing openings, and it finally leaves at the lower edges of the disc itself. With this type of disc the supply of liquid to the spraying surface is obtained

from a large number of distributing openings, and by the time the liquid has traversed a small part of the bell-shaped portion it is spread evenly round the circumference, and finally leaves the edge as a film of regular thickness. The distributing openings can be of relatively large size, and therefore do not form a restriction on the flow of liquid, neither is there any risk of their becoming blocked by any small particles of foreign matter which are present in the material under treatment.

The disc is, from the point of view of accessibility, ease of cleaning, etc., of extremely simple construction, and in normal working, even with foodstuffs, it is cleaned by simply passing water through the spray. The atomised material leaves the periphery of the disc in a horizontal plane, and the atomisation consists of the rupture of a thin film of liquid on leaving the edges of the disc. It is important that no evaporation or drying shall take place until the liquid is clear of the disc and has become thoroughly dispersed, and therefore in normal cases a current of cold air is applied in a downward direction, the air being admitted above the disc and providing a cool zone in which the disc operates. This supply of cold air is of very considerable importance, as will be seen when the design of the drying chamber is considered. For the moment, however, it may be stated that the cold air assists in the atomisation of the liquid, while providing a cool zone in which dispersal is complete before the drying commences, and it is further used to cool the driving mechanism of the atomiser and the liquor feed pipes should this be necessary.

Owing to the even distribution of the liquid on the lower surface of the atomising disc, an extremely regular particle size is obtained, provided the rate of feed is sufficient to wet the whole of the under surface. It will be realised that vastly better results can be obtained if particles are of regular size than in cases where they are of greatly varying size.

We may now proceed to consider the means adopted to obtain the second essential condition—that is, the uniform mixing of the drying air and the sprayed liquid.

MIXING DRYING AIR AND SPRAYED LIQUID

It is extremely difficult to obtain rapid and uniform contact between the atomised particles and the drying air where a jet atomiser is employed. For the air to reach the inner part of the conical zone of sprayed liquid it must first pass through the outer and more dispersed part of this zone. The objections to this, particularly in the case of unstable materials, will be appreciated on further consideration.

If we assume that the air is entering the plant at a temperature of 130° C. it will first come in contact with the outer part of the cone. The particles here will be rapidly dried, but their quantity is not sufficient to reduce the temperature of the air materially. We can take, for instance, the air which, after passing through a certain part of the zone, has been reduced by the evaporation of water to a temperature of 120° C. This air will pass on toward the centre area in which there are moist particles, and will carry with it most of the material that has been dried. The temperature of

this material will rise to something approaching that of the air in which it is being carried, and at the same time some of the dried particles will mix and adhere to the moist particles into which they are being carried. If, however, it had been possible to mix the atomised particles and the air more rapidly, the temperature drop of the air would increase at a rate corresponding to the rate of evaporation of the whole of the particles, and under normal working conditions over-heating would be impossible.

A type of drying chamber that is employed with a jet atomiser consists of a rectangular box with the

type of drying chamber which is used for the under-driven disc atomiser. The atomiser is situated toward the base of a cylindrical chamber. The drying air passes upwards, and may be given a rotary motion with advantage. The great difficulty with this type of atomiser and drying chamber is that it is impossible, except in very exceptional cases, to provide an upward air current of sufficient velocity to carry the whole of the dried material forward, and if this is not done dried material will fall downwards through the moist zone. After falling through the moist zone this powder will have to pass through the incoming hot air, where it will

FIG. 6

air inlet forming a ring round the atomiser jet. The air may be given a spiral motion in order to assist in penetrating the sprayed liquid, but this spiral motion will not persist for a long period, as the shape of the drying chamber tends to retard it. The dried powder for the most part falls by gravity to the bottom of the drying chamber, and that which is not separated in this way is usually removed from the air stream by means of bag filters.

It will be seen that this type of drying chamber, when operated in conjunction with a jet atomiser, possesses three disadvantages, the first being that provision is not made for the efficient mixing of the air with the sprayed product, the second being that the dried product is carried or falls through the region in which there is still moist material, and the third being that the conditions are bad from the point of view of preventing moist material from reaching the sides or end of the drying chamber. This last is due to the fact that direction of the drying air current is the same as that of the spray which is projected from the jet. The jet atomiser may be placed in the top of a cylindrical drying chamber with a downward current of dry air, and here the conditions are better, as the dried powder does not fall through the moist zone, though the difficulty of penetrating the whole of this zone rapidly with the drying air remains.

The second type of atomiser that we considered, that is, the disc with a number of projections from which the liquid is flung, is only used in special cases, and in general the remarks which follow concerning the design of the drying chamber for disc atomisers will apply.

We will therefore pass on to the consideration of the

be over-heated. The whole problem of the separation of the powder from the air is greatly complicated if it is attempted to carry the powder forward by means of the drying air current. On the other hand, difficulties

FIG. 7

arise if the particles are allowed to separate in the drying chamber.

With the atomiser driven from above and placed in the top of a circular chamber we are enabled to dry with a downward current of air. There is a limiting diameter for the drying chamber depending upon the distance

that the atomised liquid will travel from the disc periphery before its direction is materially affected by the air currents. Assuming, however, that a drying chamber is designed in which the radius is greater than this minimum distance, we will consider the question of applying the

FIG. 8

heated air in the manner most favourable for rapid and uniform mixing with the dispersed spray. We have already seen that it is advantageous to employ a downward current of air, and the first attempts to design a drying chamber to work with a downward current were of a simple character. The air entered the drying chamber above the atomiser and travelled downwards at a uniform velocity, or, in some cases, it was supplied more intensely at either the centre or at the outer diameter. The great trouble with this design of plant was that, owing to the eddy currents set up by the swirl of the disc, the swirl caused by the velocity of the dispersed liquid, and, finally, the strong eddy currents set up by the rapid changes in temperature and consequently in pressure within the drying chamber, due to the cooling effect of the dispersed liquid, it was impossible to direct the moist spray uniformly down the chamber. On leaving the atomiser the spray, instead of travelling in a horizontal plane, was caught up by the various eddy currents and drifted to the top and sides of the chamber. Further, the drying was not regular, as it was extremely difficult to distribute the atomised spray uniformly into the whole of the incoming air stream owing to the presence of stagnant air pockets. These difficulties have now been completely overcome, methods having been found whereby a more efficient mixing of the dispersed liquid and the heated air can be obtained, and whereby the drying time, and consequently the size of the drying chamber for a given duty, can be reduced.

The particles leaving the disc travel in a direction which is more or less tangential to the disc periphery, and if an air stream which is moving in a similar direction

impinges on the particles, the latter do not deviate greatly from their natural course. This point is very simply illustrated by noting the effect of blowing a stream of compressed air into the vapour issuing from a steam jet. It will be found that if the air jet is blown into the steam at a direction at right angles to the flow of the latter, the course of the steam becomes irregular and confused. If, however, the air jet is blown into the steam in a direction which will readily converge into the original direction of the steam jet, the steam will be deflected, but its course is under control. An exactly similar phenomenon to that obtained in the first case is found within a drying chamber where the air is travelling vertically from the top to the bottom, and thereby impinges on the atomised liquid at right angles to the direction of its movement. If, however, the air stream is caused to travel in such a direction that it has an appreciable velocity component in the direction of the travel of the atomised liquid, the course of the latter is under control. The way in which this condition is assured is quite simple, but extremely important. The air is caused to enter the drying chamber with a rotary motion in the same direction as the rotation of the spraying disc. This leads to a type of drying chamber in which the whole of the top is in the form of a box containing a large number of air deflectors giving a rotary motion to the air as it enters the drying chamber.

Subsequently this type of air distributor has been developed and improved. With the latest type the hot air is admitted at a central distributor and at a secondary air distributor, the latter being situated at the outer circumference of the top of the drying chamber.

FIG. 9

The two supplies of air do not enter with the same rotary velocity, and thus the particles which are being carried by the first current of air are later taken up by the second and more rapid current, the slip between the particles which are moving relatively slowly in the

first current as they come to the second current assisting in the promotion of rapid heat transfer.

The atomised particles must be thoroughly dispersed before drying commences, and the cool air supply to the atomiser ensures this by forming a cool zone around the atomiser disc.

THE REMOVAL OF DRIED POWDER

Passing on to the third essential, that is, the removal of powder from the air stream, we have already seen the

of powder from the air stream, and in cases where this powder is eventually collected in a lower conical portion of the drying chamber the method adopted is as follows :—

An apron piece, in the form of a truncated cone, is fitted above the lower cone, and on this apron piece most of the powder collects. It falls from the apron piece to the lower cone of the drying chamber, the air passing upwards between the apron and the upper surface of the lower cone. The surface area for the air in this

FLUE GAS HEATED.

FIG. 10

objections to the use of gravity, except in the case of the spray drier with the disc at the upper part of the drying chamber. We have shown that a rotary motion of the air is of great value in promoting rapid drying, and it has a further use in separating the powdered product towards the sides of the drying chamber. It is not a difficult matter now to obtain a very efficient separation

space is great, and therefore the upward air velocity is low and the quantity of powder carried forward is small. This powder is collected in a number of bag filters, and these can be discharged into the lower cone of the drier direct, thus forming a most convenient and simple arrangement.

(To be continued)

BONE FOOD: PICKINGS FROM A DRY BONE*

By CALORIFER

"That Bone with a grave pyrotechnical look
 Made believe he had written a wonderful book
 And the Royal Society thought it was true,
 So they took it all in: a good joke it was, too.
 (With acknowledgments to "The Professor" and
 to Oliver Wendell Holmes.)

"To be once in doubt,
 Is once to be resolved."

H. G. Wells, in one of his imaginative stories, discourses of a Boon-Food which made those who ate it grow very big. The Bone-Food provided in this volume is a Super-Sanatogen which should keep the Institute of Fuel Technology, even that mystic but expensive entity the Fuel Research Board, occupied for some time to come. We imagine Sir Alfred Mond constantly using it, as a source of inspiration, in selecting topics for the public discourses which he delivers with such admirable effect. Every one interested in epipedonic progress will need to have it upon his shelves. The book is not only a record of daring and fascinating experimental achievement but bristles with points for discussion. The narrative is as stirring as that of Drake in Darien presented by a Benson. We can see readers growing bigger and bigger with conceit of knowledge as they thumb its pages—and equally satisfied, in the end, that they know almost nothing that is really worth knowing of the inner history of flame: that Drake's doings in Darien are far nearer to their comprehension than is the dance of death in which the molecules engage in a gas-engine cylinder.

Flame is indeed a wondrous subtle demon—as Carlyle and Norsemen before him have long since admitted. All honour, therefore, to the authors for having built so imposing an altar for the worship of the force that rules our world to-day and is likely ever to remain a source of wonder to those few of us who have the will to wonder—however well we may fancy we grasp the mystery of its being. A certain editor of our acquaintance, who professes that he is neither writer nor chemist—this latter we can at once grant—but none the less (we can't say "writes," in view of his assertion) spills ink over "One Dam Thing After Another," has not yet fastened and feasted upon flame, so we have a virgin field to cultivate. Difficult as are its furrows to plough, elusive as are high temperature festivities, our task is made easier, in a measure, as we notice that a double-dyed, thrice-unhung, dihard villain, not unknown to readers of these *Bits* he has called *Blue*, in reviewing the book in *Nature* (one of those strange periodicals devoted to the unnatural), has discussed the section on the mechanism of flame, especially the mystery of carbonic oxide, which is at least as difficult to unravel as that of Edwin Drood. In so doing, he has expressed disapproval of Prof. Bone's affectation of belief in the "dry" state. This we can support, as we saw recently a P.C. message from the Professor, in Switzerland, in which, whilst there was no mention of the mountain flora or even of snow, a certain beer was referred to

with approval. At the end came the mystic phrase "Courage, mon ami, le Diable est mort." This, being interpreted, means, we suggest: that, in future, the study of hell fire may be prosecuted with safety at S. Kensington and that even when told there to "Go to Hell," students need not boggle at the mandate, as they will find no belief in dryness in that popular resort.

What, then, is to be our main line of survey of the book—if not of attack? We are not attracted by "ignition temperatures"—the idea of a flame having "a temperature" coming to us in the light of *ignis fatuus*. Also, we have no burning desire to linger over "flame speeds"—evidently a "contrariwise" subject, as between London and Sheffield, of little more than local interest. We have difficulty, indeed, in thinking of flames as otherwise than lawless—each a law unto itself. At least their turbulent qualities, as well as their chemistry, will need far closer attention, especially mathematical interpretation, if we are to solve the intricate problems they present. The two sections are probably as good illustrations as may be found of the modern inquirer's tendency to pursue chimeras.

Section III, "Gaseous explosions in closed vessels," seems more likely to be a conducive and juicy morsel, "mellering to the organ"—a good text for a sermon, as the habit of living upon such explosions and even dying in their wake is a fast growing one, which is stirring our civilisation to its very roots, as seen in the recent tragic endeavour of a princess to defy the fate of Daedalus. At least, we can fly with their aid at 281.49 m.p.h.!!

When he has nothing to say, the parson is apt to begin by analysing the words of his text. This is the more necessary when much is to be said, so we may ask, "What is a gaseous explosion?" The authors do not raise, let alone answer, the question. Our feeling is, "There ain't no such thing!" The proof is of the classical order—old but uncrusted. The almost *uralt* iron column at Delhi is unrusted. Even the ancient Briton of the earliest Iron Age must have known that his weapons were only proof against attack so long as they were unwetted. "A wet" but not water, at least in vaporous form, at once makes iron rust—and the "wet" is well known to be dangerous; hence it is that we are allowed to have and to hold, in our pockets, steel latchkeys. What more than this popular knowledge do we need to confute the Drybonians and to frame a theory of rusting? No colloid-community singing will help us.

A pretty complete case can be made out in proof of the thesis that *gases do not interact*. To make them do so, a surface of some kind has to be called in, a sofa provided upon which they can recline; apparently, change takes place thereat and thereupon, always in a liquid film, maybe only of molecular thickness. The need arises because of the electrolytic nature of the process. We, therefore, say unto you, brethren, that our text is one to be interpreted with reservations. Combustion may be *in* gases but is not primarily *of* gases. Verily, it seemeth, there be many flies in the ointment of combustion.

* "Flame and Combustion in Gases." By Professor William A. Bone and Dr. Donald T. A. Townend, Pp. 548 + xvi + 30 plates and diagrams. London: Longmans, Green & Co., Ltd., 1927. 32s. net.

The sensational event discussed in the section is the strangely "cool" behaviour of nitrogen when a mixture of air with carbonic oxide is exploded at an initial pressure of 50 atmospheres (Fig. 127). Hydrogen, it will be seen (Fig. 126), goes bang straight away: the pressure rises very rapidly to a maximum and then quickly falls off, yet surely and steadily. Carbonic oxide is both a slow and a sly dog. The maximum pressure is not only gradually developed but is long maintained. "At first, it was thought," say our authors, "that the difference might be attributable to the 'slow-burning' habit of carbonic oxide, as compared with the quick burning of hydrogen; but further experiments revealed the operation of another totally unexpected factor, namely, the presence of nitrogen, which, as was discovered later, acts as an 'energy absorber' in the combustion of carbon monoxide at such pressures." Why nitrogen should have been a "totally unexpected factor," when it was introduced in

peculiar 'energy absorbing' effect and becomes chemically 'activated.' On such an assumption, the meaning of the $2\text{CO} + \text{O}_2 + 4\text{N}_2$ cooling curve is that the radiant energy which had been absorbed by the N_2 molecules during the previous combustion period was being slowly evolved in a kinetic form far into the subsequent cooling period, the 'activated' nitrogen not having entirely reverted to normal until at least 0.6 sec. after the end of the combustion period."

They stress certain points, namely:—

"(1) That the 'energy absorbing' nitrogen effect referred to was only obtained when carbon monoxide and oxygen were in juxtaposition in such high pressure explosions as though it were essentially a 'resonance' effect. (2) That the presence of hydrogen, which (as will be seen later) profoundly affects the radiation for a CO-air explosion, is inimical to it, a circumstance pointing to the 'effective radiation' being that arising from $\text{CO}-\text{O}_2$ but not from $\text{CO}-\text{OH}$ interactions.

Fig. 126

Fig. 127

so large a proportion, we have difficulty in understanding. From the days of Cavendish onwards, this Cinderella among gases has been known to take part in the combustion when hydrogen is burnt in air. Even the picking up of her slipper by Prince Haber and his German court seems, however, to have had little effect upon the public appreciation of her attractive beauty.

When either oxygen or argon, even carbonic oxide itself, is substituted for nitrogen in the mixture (Fig. 129), no cooling effect is observed; each such admixture would seem, indeed, to promote the rate of change. At least, it is difficult to avoid the feeling that carbonic oxide must be a slow-burning combustible as compared with hydrogen and that the rate is quickened by the gases mentioned, although lowered by nitrogen.

According to the authors:—

"The nitrogen functions differently in a hydrogen-air explosion, where it acts as an inert diluent only, from what it does in a carbon monoxide-air explosion, where, in addition to its ordinary diluent action, it has a

(3) That pressure is highly conducive to it; and (4) that recent experiments have shown that it is not manifested in methane-air ($\text{CH}_4 + \text{O}_2 + 4\text{N}_2$) explosions at high pressure, where equal volumes of carbonic oxide, hydrogen and steam are produced."

Provided that oxygen be present in excess of that required to burn all the carbonic oxide, a relatively large quantity of nitric oxide is produced. This, however, the authors regard as a secondary effect, occurring during the cooling period (1), though at high pressures it may begin sooner.

Finally, we are told

"that by the term 'activated nitrogen' the highly ionised 'active nitrogen' discovered by the present Lord Rayleigh is not implied but a less 'activated' form; also, that the radiation concerned, though it may in part be ultra-violet, is more probably infra-red, a point which has yet to be decided experimentally."

If not ultra-violet, the effective radiation is infra-red! Quite so! In other words, our elusive friend the Snark,

if not white, is black: equally content to be called either candle-ends or toasted cheese. The conclusion is one that should give satisfaction to all our souls. In fact, in telling us that the peculiar energy-absorbing effect, whereby it becomes chemically "activated," is a resonance effect, the authors use purely frumious language, having for some unexplained reason made up their minds that

"The shark's a peculiar creature that won't
Be caught in a commonplace way."

We are asked to believe in a big-drum response by the nitrogen- to visualise the molecules as kettle-drums at the back of the orchestra, vibrating in sympathy with

"Activated" is a horrid word,* though Baconian, not jargonesy, in its origin--all the worse when put into inverted-comma shorts. Let us hide it in the big drum, both to mute this and also spare our commas: there are always too few of these to satisfy composers' unhealthy desire to spoil the conjunction. Putting drum aside and sounding neither the loud timbrel nor the trumpet-- unless "Wait until the clouds (of theoretic doubt) roll by" be quietly blown upon this last, as a second theme, by way of a counterpoint under-current of melody, reminding us of our ignorance-- let us show ourselves able to reason dispassionately upon the super-plenitude of observation at our disposal: get back to Lavoisier, in fact. Recognising the inert

FIG. 129

some other instrument, if not a high treble, then perhaps a double-bass; maybe, by some strange telepathic or ectoplasmic influence, in sheer response to the sharp tap of the conductor's baton. Unfortunately, in many attendances at Queen's Hall, we have always seen drummer and drum-sticks at work: Sir Henry Wood, in his wildest moments, has never hit the drum direct. Prof. Bone is but human, after all, in his desire to call in the big drum; we all love to make sprats, at least, of our minnows. The humble bacterium, however, seems to be able to do without the drum: when in its cold lodging underground, in the root nodules attached to the Leguminosæ, without the least fuss, it calmly and mutely assimilates nitrogen, which ultimately takes the form of protein.

qualities of the gas presented to him in air, Lavoisier eventually named this *Azote*. His genius inclined him to foresee the advantage, if not the need, of terming its principle, the element, *Aminogen*, rather than *Nitrogen*, the baptismal name ultimately chosen. The French use *Azote* to the present day but the genius of Lavoisier is no longer with them: they have but one name for the highly active element and for the strangely neutral, gaseous compound of two of its atoms which bulks so largely in our life. Never was question put so wrongly answered as, "What's in a name?" *Everything!* Much

* Active and activity are perfect words: to bring "ate" to them is to deprive them of their aural charm. If a verb "to make active" be needed, "activerie" is a far less strident form. Let us remember the poet's caution: "And don't confound the language of the State With long-tailed words in *orby* and *alo*."

of the stupidity whereby chemistry is so greatly helped to-day is due to the disregard of names and the use of bad language. Most atoms, it seems, find great difficulty in landing upon the azote raft - to get grip of the aminogen atoms and overcome their sturdy, brotherly affection, as is done by force of hydrogen within the bacterium. The potential at which hydrogen acts in such case must be a high one, of the big drum order. Many atoms find the aminogen atoms both attractive and affectionate - willing to marry them without outside dowry. Oxygen alone seems shy of aminogen—the molecules tend to coquette and the atoms do not seem to marry firmly: they do so only if a dowry be found for them; when married, their divorce is easily effected. The same may be said, however, of carbonic oxide. It and nitrogen are in much the same boat; they need hot wooing.

The irreverent chemist called Henry maintains that carbonic oxide cannot be and, in fact, never is married with ordinary oxygen—the dowry of energy at disposal being insufficient to satisfy the demands of the two families. Baptism must precede marriage. Holy water being provided and a spark applied, behold, a little hydrogen is born and burnt. A taper presented to the couple has an even greater effect, reeking as it does of hydrogen. The hydrogen may be only the proverbial "little one": still, it is there and in gas-land the code of morals is high. At once laid upon the sacrificial altar and burnt, it is transfigured into a higher sphere of usefulness: the late Mr. Clutton Brock would have told us that through its agency the oxygen becomes in part transcended—thus:

The charm of oxygen thus transcended, at the higher potential of the peroxide, can no longer be denied: the union with carbonic oxide is consummated. Hence it is that hydrogen sets the pace when present in more than minimum amount in an explosive mixture. On this account also, when more than a certain proportion of water is present at higher pressures, the rate of change is lowered: so much hydrogen is then set at liberty and in a position to act as "tweenie," to dispute enjoyment of the peroxide with the carbonic oxide. With such dowry, at the higher potential it has in the peroxide, oxygen is worth looking at by nitrogen. This also becomes amorous and insists upon marrying some of the oxygen atoms, per favour of the peroxide.

Since the days of Davy and Faraday it has been known that combustible materials are very human in their proclivities—much given to interfering with each other's business. It is strange that the authors pay so little attention to this peculiarity—that it should all but escape notice by the workers generally who have discussed combustion. This is the more remarkable, in view of the special attention called to the phenomena of interference by Moureu and Dufrasse in their wonderfully complete studies of the subject. We ourselves, organic nature at large, could not exist if oxidation were not most rigidly controlled and kept under.

Carbonic oxide and nitrogen are clearly jealous lovers of oxygen and violently interfere with each other's

enjoyment of the atom, much energy being wasted in the struggle—there seems to be no need, however, to assume that the effect of the nitrogen is in any way special or peculiar to the element but merely that the contending molecules are simultaneously converted into "perhydrols," which act and react, more or less as follows:—

Maybe both carbonic oxide and nitrogen are, at least in part, each burnt separately in circuit with hydrogen and their perhydrols then interact; also it is conceivable that a dissymmetric perhydrol $\text{N} : \text{N} \begin{smallmatrix} \cdot \text{OH} \\ \cdot \text{OH} \end{smallmatrix}$ is formed from nitrogen. Combustion is not complete, the marriage is not consummated at the $\text{CO} \begin{smallmatrix} \cdot \text{OH} \\ \cdot \text{OH} \end{smallmatrix}$ stage: this but corresponds to the signing on at the registry office and to church proceedings. The perhydrol may revert to the oxide or it may pass into carbonic acid, $\text{OC} \begin{smallmatrix} \cdot \text{OH} \\ \cdot \text{OH} \end{smallmatrix}$.

The extent to which one or the other change takes place determines the extent to which combustion is effective. The influence of an excess of either oxygen or carbonic oxide, used in place of nitrogen, may well be to increase the extent to which carbonic acid is formed.

What of argon? The effect produced by this gas does not seem to be merely that of an inert diluent. Although the rise in pressure is slightly less rapid, the level it reaches is higher than when any other gas is used and falls less. Such behaviour deserves further study.

Possibly, even probably, the argonides are not the chemical nullities they are supposed to be. Helium is clearly combined in radium and is let loose, we are told, short of two charges, like a "Widder" of a polyandrous people who has lost two husbands and has two affinities unsatisfied, ready on the first occasion that offers to join up in loose union with any pair of amorous electrons she may meet. Why not with oxygen? Prof. McLennan would have us believe that the characteristic intense green line in the spectrum of the aurora is due to oxygen. It is very faint in "oxygen"; better seen when a little helium is added but still better when neon is present and the strongest line in the spectrum of an argon-oxygen mixture. May not the line be the outward, visible sign of mating of flirtatious oxygen with a stolid argonide? The physicists' oxygen may safely be assumed to have contained a trace of helium, as this leaks selectively through heated glass into a vacuum. We trust Prof. Bone will be prepared to give our suggestion a "try": there is such twinkle in his eye that, at times, we can fancy we see green reflected in it, despite his north country origin.

Surely there can be no need to invoke any special act of Providence, in the form of radiant energy and resonance, to account for the phenomena so wonderfully depicted in the curves we have discussed. We would venture to exhort Prof. Bone to leave all such fancy explanation to the chelate school and the dreamers who asperse the monogamy of hydrogen—to cast off all such

calf's skin and wear no crab's claws but only a lion's hide of sound philosophy. If we are to use the drum, let it be to the refrain, "Rub-a-dub-dub, *three* men in a tub." *Drybonia* is not a habitable land. Like Heaven, it is a hypothetical region where there is neither giving in marriage nor marrying. Chemicals could not be there—only inerts, not even shorts.

The authors end their "Inquire within upon almost everything relating to flame and gaseous explosions" with the following epilogue:—

"Two hundred years ago it was believed that combustion was due to the escape of a subtle and imponderable *phlogiston* from the burning material. A century later it was universally regarded as the result of chemical interactions between oxygen and the combustible. Nearly 50 years ago it was discovered that, in certain cases, the rigid drying of such a system renders it comparatively (if not absolutely) unreactive (!) and, therefore, that combustion is either conditioned or greatly helped by the presence of moisture. To-day a new vantage point has been reached from which it seems probable that in the near future we shall be able to say that combustion is conditioned by an "ionisation" of the reacting (!) gases."

In thus ending, they but jump us from the frying pan into the fire—the blessed word *ionisation* has such ambiguous meaning that it is meaningless.

The proclaimed new vantage point is just a nullah. It will not only answer to "Hi!" but to any loud cry.

We are thus, as ever, brought back to words—for which we have no consideration. It is almost a characteristic to-day of the scientific mind to be careless in the use of words, to be obstinate in their misuse. Our science is advancing mechanically but not morally. In the work before us, the evidence is overwhelming of an ever-increasing care to be exact in deed—but there is no such evidence of desire to be exact in word. Although an inhabitant of Verulam and a leading light of the Baconian Club, Prof. Bone is in no way mindful of Bacon's statements that "the ill and unfit choice of words wonderfully obstructs the understanding"; that "words force and over-rule the understanding and throw all into confusion and lead men away into numberless empty controversies and idle fancies"; therefore, that "it behoves us to be most careful in our choice of words and concise in our definitions."

The words we use of chemical change are uncertain in their meaning. It is now recognised (it is our theory) that all chemical change involves action *between* substances—that the changes are *interactions*—why then speak of them as *reactions* and thus imply that they are one-sided, back actions? Only the billiard player learns to use the word action aright—he is told and must learn once and for all, if he desire to score, that action and reaction are equal and opposite. Our Editor might well give us an essay upon the theme: we derived our own sense of precision, in using the terms, in early youth, from a billiard manual. The authors are evidently sufficiently fallible to be caught in the toils of fashion, react to it, in fact, by using the abomination *reactant*. Surely agent is good enough for all purposes and all time. The *actant* is unknown to us, so why re him and

put so ungainly and unnecessary a term upon the line. Kelly's Directory has a long list of Agents but makes no reference to actants. Actors are in repute at the Savage but if our Editor or Mr. E. V. Evans spoke of them as actants they would be treated as mountebanks. If a few scatterbrained limelights at Cambridge perversely defy Sir A. Quiller Couch—let their's be the agony alone: there is no need to defile honest pages with their banal productions. Let it no longer be said

Which I wish to remark—

And my language is plain—
That for ways that are dark
And for tricks that are vain,
The heathen Stinkee* is peculiar.

We would specially beg our authors to be particular in the use of the word *theory* and to reserve this for state occasions. They say: "In science a theory should be judged by its ability to give consistent interpretation of the facts to which it applies and it may be accepted as a serviceable implement so long as it succeeds in doing so and until a better one is available. After all, theories are merely tools and vantage points, useful only so long as they best serve as such and not as objects of veneration, however they may please us."

No! No! A theory is a complete doctrine, into which all the facts may be fitted. The only theory known to us in chemistry is "The atomic theory." This stands complete and apparently impregnable. We have no *theory* of combustion at present—nothing more than halting doctrine: mostly speculation, guess, hypothesis, we may call it, according as we favour a Latin, Teutonic or Greek form of speech.

We don't worry over misprints, though we don't like "data is"; still the entry: *Berthollet. Essai de Statique Chimique* (1905) (p. 54) seems to hurt our sense of historical accuracy. We should like to have met him at that date and heard his opinion of us. To refer students to M. Faraday is more than desirable—but why to the originals and not to the cheap 2s. edition published by Dent? This every young chemist can and should have at his bedside.

To conclude: the book is a wonderful one but not all true. Royal Society opinion is well known to be fallible and subject to fashion and favouritism. When the next edition is issued, as it must be at an early date, rewritten with Baconian care and Bonian wealth of experience, the meaning of the word *theory* having been mastered and the attempt made to develop a consistent, logical doctrine worthy to rank as theory, therefore a safe guide to practice: the work will be monumental, because of the transcendent importance of the subject!

P.S.—The mystic message from Switzerland we have referred to has been confirmed in a recent address by the Bishop of Birmingham to the boys of Westminster School (*The Times*, Sept. 26). When bishops take the broom in hand it were time that chemists harrowed their field to clear it of some of its many superstitions. They cannot allow the Church to outdo them in their desire for truth.

* We fancy that *stinkee* lies some cryptic allusion to chemistry—Stinks?—Ed.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

BRISTOL SECTION

At the opening meeting, held on October 6, the President of the Society, Mr. Francis H. Carr, C.B.E., gave an address on "Vitamins in relation to chemistry and medicine." Mr. J. Bernard, the new chairman, presided.

Mr. Carr first showed how the elements of an ordinary diet were not sufficient to maintain proper health, and required to be supplemented by vitamins. Lantern slides were shown to illustrate the effect on animals of diets rich in or lacking in vitamins. The President then discussed the five vitamins A, B, C, D and E, and remarked that there would probably be further subdivision, particularly of A, and very likely of C. An account was next given of the types of diseased condition due to lack of the various vitamins and of the methods used for studying the effect of vitamins on the animal. The sources of the different vitamins were discussed in detail, and it was pointed out that British Empire fish-liver oils were not only relatively high in their content of vitamin A compared with Norwegian oils, but their preparation was being rapidly improved.

The chemical tests for vitamin A were described, and the close connexion of vitamins A and D with the chemistry of cholesterol was emphasised. Upon vitamin D calcification of the bones largely depends, but for the vitamin to be effective it must be in suitable proportion to the amount of carbohydrate taken in. An account of the controversy about the relation of vitamin D to rickets was given, leading up to the recent work which has shown that cholesterol, activated by ultra-violet light, is extremely potent in restoring calcification, and that the effect is due not to cholesterol but to ergosterol, which is remarkable for the absorption of light. What actually happened was not known. Irradiation was best done in the absence of oxygen, and its action seemed to be that a maximum activity was quickly reached, after which the activity began to fall off. The body glands contain sterols, and there was reason to believe that the sunlight acting on the skin forms these substances. Here the chemist had discovered the method of producing vitamin D by artificial means; but although this information had been available to margarine makers for some seven months, it remained to be learned that any of them was making proper use of it in this country.

In the discussion which followed Mr. Carr's address, Mr. S. Badoek described the benefit obtained by adding cod-liver oil to the diet of pigs. Dr. Rixon paid a warm tribute to Mr. Carr for his very lucid address, in propos-

ing a hearty vote of thanks to him. Mr. Robertson, who seconded the vote of thanks, remarked on the fascinating, clear and concise account which Mr. Carr had given of the vitamins, those small facts which produce such relatively great effects.

CALENDAR OF FORTHCOMING EVENTS

Oct. 14.—Society of Chemical Industry, *Chemical Engineering Group*, Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "A recent development of spray drying," by J. Arthur Reavell. During the same afternoon a visit will be paid to the Kestner Experimental Works at Camberwell, where a machine of the type to be described in the evening will be seen at work.

Oct. 18 and 19. Society of Glass Technology. Meeting in Sheffield. On Oct. 18, at 6 p.m., meeting of Furnace Survey Committee. Informal Dinner at 7.30 p.m., at the King's Head Hotel, Sheffield. On Oct. 19, Visit to Glass Works of Messrs. Bealson, Clark & Co., Ltd., Rotherham, at 10.15 a.m. Luncheon at 1 p.m., at the King's Head Hotel, Sheffield. At 2.30 p.m. General Meeting in the Applied Science Department of the University, Sheffield. Introductory address by the President, Mr. W. Butterworth, senior. Papers will be presented as follows:—(1) "Opal glass—crystal growth and impact brittleness," by J. F. Hyslop. (2) "The Birmingham glass trade 1740–1833," by F. Buckley, and (3) "The detection of selenium in decolorised bottle glasses," by E. J. C. Bowmaker and J. D. Canwood.

Oct. 19.—Society of Chemical Industry, *Glasgow Section*. Held jointly with the Chemical Engineering group, Cadoro Restaurant, at 7 p.m. "The desiccation (De Vecchis) process of beet sugar manufacture," by C. Scott Garrett and G. W. Riley.

Oct. 19.—Institute of Chemistry, *London and South Eastern Counties' Section*. 30, Russell Square, London, W.C.1, at 8 p.m. "Chemists and dividends," by S. M. Gluckstein.

Oct. 20.—Chemical Society. *Ordinary Scientific Meeting*. Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Studies of dynamic isomerism. Part XXIV. Neutral salt action in mutarotation," by Prof. T. M. Lowry and G. F. Smith. (2) "Studies of dynamic isomerism. Part XXV. The mechanism of catalysis by acids and bases," by Prof. T. M. Lowry. (3) "10-Chloro-5;10-dihydrophenarsazine and its derivatives. Part V. The general method of synthesis and determination of constitution," by C. S. Gibson and J. D. A. Johnson. (4) "On active nitrogen. Part IV. The independence of the afterglow and chemical properties of active nitrogen," by E. J. B. Willey.

Oct. 21.—Society of Dyers and Colorists, *Manchester Section*, at the Manchester Literary and Philosophical Society, 36, George Street, Manchester, at 7.15 p.m. "Light and life," by Prof. E. C. C. Baly. Joint meeting with the local Section of the Institute of Chemistry. Dr. H. Levinstein in the chair.

Oct. 27.—Society of Chemical Industry and Institute of Chemistry, *Edinburgh and East of Scotland Sections*. Joint Meeting. The North British Station Hotel, Edinburgh, at 7.30 p.m. Inaugural address by J. Adam Watson.

Oct. 27.—Coke Oven Managers' Association. Annual General Meeting at the Hotel Great Central, London, at 2.30 p.m., when Mr. G. A. Hebden will deliver his Presidential address. At 6.30 p.m. the Annual Dinner will be held.

Oct. 28.—Society of Chemical Industry, *Liverpool Section*. The University, Liverpool, at 6 p.m. "Merseyside -and chemical industries," by Dr. A. Holt.

Oct. 28.—Institution of Chemical Engineers, at the Institution of Civil Engineers, Great George Street, Westminster, S.W.1, at 6.30 p.m. Public Lecture by Sir William Bragg, K.B.E., F.R.S., on "Crystallisation."

BIOCHEMICAL SOCIETY

A meeting was held in the Biochemical Laboratory, Cambridge, on October 8, when the following papers were read:—

"The scission of gelatin into constituent proteins," by S. B. Schryver and K. V. Thimann. Evidence was given of the lability of the proteins from which the gelatin complex is formed, and also of the possibility that the constitution of gelatin varies according to whether it acts anionically or cationically. Experiments were carried out with the object of obtaining two forms of gelatin. A product was used which had been freed from inorganic constituents by electrolysis, and from degradation products etc. by flocculation. The hydrochloride and sodium salt of this preparation were submitted to electrolysis. The gelatin obtained by the electrolysis of the hydrochloride formed a stiff gel, and very little nitrogen was present in the supernatant liquid. By the electrolysis of the sodium salt, however, two products were obtained, viz., a very slightly soluble, very bulky flocculum, and a soluble fraction, which showed no tendency to form a gel. These two products are provisionally named soluble and insoluble anagelatin. The former is soluble in water to the extent of about 15 parts in 100,000, and experiments were quoted to indicate that it cannot be dispersed in warm water without undergoing a small amount of irreversible change. The soluble fraction has a high molecular weight. A gel could not be formed by the mixture of the soluble and insoluble fractions in the correct proportions and the subsequent electrolysis of the hydrochloride. It was shown that the molecules in the anionic and cationic forms must have different intramolecular arrangements as they yield different products on hydrolysis. The relationship of the gel obtained cationically and of the soluble and insoluble fractions to one another was discussed, and it was suggested that the gel was formed by a combination of an insoluble gelatin and a soluble gelatin, the latter being derived from the former by the action of warm water during dispersion etc. On making the mixture alkaline, and removing the alkali by electrolysis, intramolecular change and separation of the two fractions takes place. Amongst other experiments in support of this conception were some which indicate that heating with water does not degrade gelatin, but converts it into a complex protein, for which the term metagelatin is suggested.

"The interferometer method for the diagnosis of pregnancy and malignant growths," by G. S. Haynes and C. G. L. Wolf. The method proposed by Paul Hirsch for the diagnosis of pregnancy and malignant growths depends upon the detection of a change in the refractive index of a serum, due to specific ferments in the serum acting upon a substrate prepared from the placenta, or a malignant growth. Haynes and Wolf find that a great part of the differences between the refractive index of the control serum and that in contact with the substrate observed by other workers is due to the giving off of soluble material from the unprotected rubber stoppers used to close the tubes containing serum and substrate during incubation. When the stoppers are protected with a covering of pure tinfoil these large differences between the two sera are eliminated. Performing the tests in this way the authors have re-

investigated the action of pregnant serum and serum from cases of malignant disease on their respective substrates. They are unable to find that any specific digestion of protein occurs in these conditions. Digestions were carried out at 37° and 0°. A small difference is usually obtained, in that the substrates kept at 37° usually give a higher reading. It is impossible to say whether this is a true ferment action, because absorption of water by the desiccated substrate undoubtedly occurs, leading to a change in the concentration and refractive index of the serum. This was shown in experiments where varying amounts of substrates were used with the same amount of serum. The increase in concentration was always higher in those tests where larger quantities of solid substrates were employed. Other solid colloidal material such as aluminium hydroxide, silica, and animal charcoal also produces changes in the refractive index of the serum. From these experiments the authors conclude that the method in its present form cannot be used either for the diagnosis of pregnancy or of malignant growth.

"The isolation of a second sterol from yeast," by Ida Smedley MacLean. In 1920, Smedley MacLean and Thomas (*Biochem. J.*, 14, 483) described the isolation of a dextrorotatory sterol from one sample of yeast instead of the levorotatory ergosterol obtained from all the other samples of yeast investigated. It is now found that, working on a somewhat larger scale, the crude sterol prepared by the saponification of yeast fat consists of a mixture of two isomeric sterols—(a) ergosterol, m.p. 158°; $[\alpha]_D^{20} = -134^\circ$ and (b) dextro yeast sterol which softens at 98°, finally melting at 105°, and having in chloroform a specific rotation of $+25.7^\circ$. The dextro sterol is considerably more soluble in alcohol and ether than the ergosterol, and like the latter is precipitated by digitonin. Both sterols have the same elementary composition, and each contains three double bonds; they may be separated by fractional crystallisation from ether. The biological properties of the new sterol are being investigated.

"On the origin of ethereal sulphates," by T. S. Hele. Proof of Baumann's original theory (1876) of the formation of ethereal sulphates in the animal by the direct union of phenolic compounds with sulphate has only been advanced in one series of experiments (Hele, 1924), wherein guaiacol was shown to be united in the dog with sulphate, in both instances being administered by the mouth. Many observers have failed to show any such direct synthesis, but such observers have in general used phenol. These failures have given rise to various theories; for example, (1) that phenols unite with such compounds as sulphites or cysteine and oxidation to ethereal sulphate follows conjugation, or (2) that ethereal sulphates only arise from endogenous sulphur and never from exogenous. For such theories there is really no experimental justification. It has, however, been suggested by Pryde (1926), in his book "Recent advances in biochemistry," that possibly guaiacol is a substance too far removed from the normal metabolic paths to warrant comparison with phenol, that is, the guaiacol experiments cannot be regarded as proof of a normal metabolic process. In the present experiments indol and phenol were administered with sodium sulphate by the mouth to dogs, and proof was forthcoming of the utilisation of the sodium

sulphate in forming the corresponding ethereal sulphate. Furthermore even when such formation of ethereal sulphate was effected at the expense of so-called endogenous sulphur, there was evidence that the reacting sulphur compound was a sulphate, replaceable directly by administered sulphate. In this consideration there is no difference between exogenous and endogenous metabolism.

"The rate of buffering of acids and alkalis by amino-acids and proteins—a preliminary study by thermal methods," by F. J. W. Roughton. Hartridge and Roughton's thermal method (1924) of following the velocity of rapid chemical reactions has been developed to a greater sensitivity. Chemical processes occurring within 0.002 sec. to 0.1 sec. can now be followed with an accuracy ranging from 1% to 10%, according as the total temperature change accompanying the reaction changes from 0.1° C. to 0.01° C. The neutralisation of NaOH by HCl, CH₃COOH, K₂HPO₄, KH₂PO₄, H₃BO₃, and of AmOH by HCl and CH₃COOH takes place in less than 0.002 sec. A new lower limit to the velocity of ionic reactions in solution is deduced. The effects of (H) and (OH) on the rate of reactions of dissolved CO₂ with alkali, and on the rate of reactions between bicarbonate and acid agree with those found by previous workers. Glycine and NaOH react in less than 0.002 sec.; glycine and HCl have not yet given consistent results. A mixture of the blood proteins (1 pt. blood to 3 pts. water) reacted with several acids and bases to within 10% of completion in less than 0.002 sec. The bearing of these results on the rate of buffering of acid in muscle is indicated.

"The osmotic pressure of isoelectric egg albumen," by J. Marraek and L. F. Hewitt. Sørensen (1917) measured the osmotic pressure of isoelectric egg albumen with 15.4%, 4.36%, and practically 0% of ammonium sulphate in the external fluid. The pressures varied greatly in the three cases. The authors have used as external fluids acetate buffers, *pH* 4.8, containing 0.124, 0.024, and 0.006 molar sodium acetate. The osmotic pressures found agreed well with those found by Sørensen with 4.36% ammonium sulphate. With the lowest salt concentration, the osmotic pressure was rather higher at low protein concentrations and lower at high protein concentrations, approaching what Sørensen found with no salt present. The molecular weight of egg albumen, calculated from these results, is higher than that calculated by Sørensen. The osmotic pressure of egg albumen at *pH* 7.3, plotted against the protein concentration, gives a curve convex towards the protein axis similar to that given by serum proteins.

"The adsorption of phthalein dyes by proteins," by L. F. Hewitt. When proteins are added to certain phthalein and fluorescein dyes, the colour is not discharged or altered as usual when acid is added. The absorption bands of these dyes are shifted by some 200 Å.U. towards the region of longer wave length when the protein and acid are added. Only those dyes usually changing colour on the acid side of the isoelectric point of the protein behave in this manner, and it is concluded that the quinonoid form of the dye forms an oxonium salt with the acid protein. These same dyes act as acid-fast stains for certain tissue sections and for silk and wool. When proteins are added to fairly concen-

trated solutions of any fluorescein or phthalein dye, and the mixture is gradually acidified, a precipitate appears when the isoelectric point of the protein is reached and the precipitate redissolves at about *pH* 2.5. These critical reactions are the same for widely different dyes and proteins. Analyses revealed 20–30 molecules of dye to 1 molecule of protein in the precipitate. The precipitation is ascribed to salt formation between the acid dye and the protein behaving as a base.

SOCIETY OF PUBLIC ANALYSTS

An ordinary meeting was held at the Chemical Society's Rooms, Burlington House, on October 5, Mr. E. Richards Bolton, President, being in the Chair.

Certificates were read for the first time in favour of L. V. Cocks, F. Dixon, B.Sc., D. M. Freeland, D. Geoghegan, C. G. Hyde, V. J. Tilley, L. Wild, B.Sc., H. A. Williams. Certificates were read for the second time in favour of C. E. Corfield, B.Sc., H. E. C. Powers, B.Sc., J. D. Rogers, and A. Samson. The following were elected Members of the Society:—F. C. Bullock, B.Sc., T. H. Fairbrother, M.Sc., R. S. Rack, and S. G. Sherman.

The President announced that the next meeting, on November 2, would be held, by invitation of the Pathological Institution of St. Mary's Hospital, in the theatre of that hospital. The following papers were read and discussed:—

"The oil of *Centrophorus granulosus*," by A. Chaston Chapman, F.R.S. The liver oil of the Portuguese shark "barroso" (*Centrophorus granulosus*) contains the unsaturated hydrocarbon, spinatene, an alcohol probably identical with the batyl alcohol found in Japanese shark oils, a liquid alcohol (sclachyl alcohol, C₂₁H₄₀O₃), cholesterol and glycerol (0.5–0.6%), together with stearic, palmitic and oleic acid, and possibly smaller proportions of other saturated and unsaturated fatty acids.

"The separation of titanium from tantalum and niobium," by W. R. Schoeller, Ph.D., and E. C. Deering, B.Sc. Previous methods of separating titania from the earth acids are reviewed and criticised, and an outline is given of a more accurate separation method based on the dissociation of the soluble tartaric complexes of the metallic acids by a mineral acid; the earth acids are precipitated, whilst the titanic salt remains in solution. The results as yet obtained are rather approximate, but work aiming at a more exact separation is in progress.

"The determination of aldose sugars by means of chloramine-T, with special reference to the analysis of milk products," by C. L. Hinton and T. Macara. Each molecule of chloramine-T is equivalent to two atoms of iodine, both in the oxidation of sugar and in the final liberation of iodine on acidifying. The oxidation proceeds more slowly than that with alkaline iodide solution. The most suitable conditions for the oxidation of dextrose and lactose have been worked out, and the extent of the slight oxidation of sucrose and levulose under standard conditions has been determined. The action of chloramine-T on the non-sugar constituents of milk serum has been studied; under the conditions specified it does not cause an error greater than 0.4% of the total lactose. A procedure is outlined for the determination of lactose in fresh milk and condensed sweetened and unsweetened milk.

CORRESPONDENCE

THE VALUE OF A UNIVERSITY EDUCATION

SIR,—It appears to me that the following letter, received by a chemist holding the degree of Master of Technical Science and with three years' industrial experience at home and abroad, on application for a position as a temporary junior chemist, merits publication:—

"Dear Sir,—We have your application of the 23rd ultimo, and after a perusal of its contents we consider that you will be suitable for the temporary vacancy we have to offer in our laboratory.

"The hours will be from 7 a.m. to 7 p.m. daily, including Sunday, i.e., 84 hours per week, and the rate of pay is 1s. 2d. per hour, making a total of £4 18s. per week.

"The duties consist chiefly of general analysis, including coal, limestone, and water.

"Should you accept this post, we shall expect you to be ready to take up your duties at 8 a.m. Monday, the 10th instant.

"We may add that you will find no great difficulty in obtaining lodgings in this neighbourhood, but should you desire it we will get into touch with apartments in anticipation of your arrival.

"Please oblige by replying at your earliest convenience.—Yours faithfully."

Might I say that the wages of a joiner and bricklayer in the Manchester district are 2s. 1d. per hour, of a plumber 2s. 2d., and of a labourer 1s. 7d. per hour? I think further comment is unnecessary.

Yours faithfully,

ANDREW McCULLOCH

THE PROFESSION OF CHEMISTRY

SIR,—All chemists should be grateful to you and to your correspondent, "STILL IN IT," for the publicity which you have given to at least one example of gross underpayment of qualified men.

Unfortunately, this is all too frequent a practice, but surely some remedy can be found (although it may be a long process) if only chemists generally will get together and discuss their problems. A few tentative steps along these lines have been taken, but have not received much support or consideration, even from the bulk of the members of the Institute of Chemistry, who at least are organised; they are all automatically members of their local section, where any subject affecting chemists can be discussed, but they don't even turn up! An average attendance of about fifty out of eighteen hundred members in London is pretty poor.

To my mind, the most hopeful way of tackling this problem of adequate remuneration is through the Institute, but the necessary "pep" must be provided by the rank and file, and preferably by the younger men, who are most affected.

I wonder if feeling on this subject has got beyond the grumbling stage yet.

Yours faithfully,

F. J. TRITTON

THE REGISTRATION OF CHEMISTS

SIR,—In the first number of the *Chemical Practitioner*, the new official organ of this Association, to be issued this month, the report of the Registration Committee will be published, so that some preliminary account of it may be of interest to your readers.

In the first place, the Committee insists that to form a General Chemical Council the co-operation of all societies with a membership confined to chemists is necessary. The Committee is rightly of the opinion that no society alone can deal with so complex a question, and that each would probably have valuable contributions to make before a scheme completely acceptable can be formulated.

The question of the minimum qualification for admission to the register is discussed, the Committee being of opinion that the "B" qualification of the British Association of Chemists will suffice as a satisfactory basis for the compilation of the register. The Committee further agree that six years after the inception of the register an approved university degree or diploma shall be the only recognised qualification for registration. Upon August 6 an official statement regarding the "B" qualification appeared in the *Chemical Age*, so that the requirements in respect of it have been widely circulated. It was there stated that the problem of qualification had been solved by this means, and the foundations of the register already existed, and, although doubtless it is capable of improvement in detail, it should relieve the Registration Council of a great deal of preliminary work in this direction.

The Committee does not suggest that membership of the Institute of Chemistry or of the British Association of Chemists should be a *sine qua non* of admission to the register at first, but it recommends that membership of one, or preferably of both these bodies is, as a matter of convenience, desirable. It would be open to any chemist supposing himself to possess "such qualifications as would be accepted by the Institute of Chemistry or the British Association of Chemists" to apply for admission to the General Register of Chemical Practitioners.

At this preliminary stage it will suffice to emphasise two points. In the first place, a report is generally open to the charge of being a "disappointing document." However that may be, the Council will be satisfied if, in criticising it thus, societies or individuals are moved constructively to criticise it. The work of the Committee is by no means final nor complete, nor does it represent more than in outline the detailed recommendations the Committee will be in a position to make. Secondly, emphasis may well be placed again upon the Committee's and Council's conviction that registration cannot and ought not to be the work of one society alone, and that discussion as to who shall have precedence in accomplishing that for the sake of which all should unite will do nothing to help forward the work.

I am, sir,

Yours faithfully,

HENRY T. F. RHODES,

General Secretary, British Association of Chemists

"Empire House,"

175, Piccadilly, London, W.1

PERSONAL AND OTHER ITEMS

Imperial Chemical Industries, Ltd., has given £1000 to the National Playing Fields appeal.

Sir Edward Brotherton, the head of Brotherton & Co., Ltd., the well-known chemical manufacturers of Leeds, whose many services to the public include the gift of £100,000 for a library to the University of Leeds, has handed over the ruins of Kirkham Abbey to the Office of Works for preservation for the nation.

The chief guest at the annual dinner of the Coke & Oven Managers' Association on October 27 will be the Right Hon. Earl Fitzwilliam. Among others present will be Prof. W. A. Bone, F.R.S., Mr. F. Hodges, Dr. C. H. Lander, and Sir Edward Ward. Mr. G. A. Hebden, the President of the Association for the ensuing year, will deliver an address.

Mr. H. R. Raikes, Vice-Rector of Exeter College, Oxford, has been appointed Principal of the University of the Witwatersrand, and will take up his duties early in the New Year. Mr. Raikes is a chemist and an enthusiastic airman. He is probably the only chemist who holds a pilot's certificate.

Dr. A. Reginald M. McLean, assistant professor of chemistry at McGill University, Montreal, and vice-president of the well-known firm of consulting chemists, J. T. Donald & Co., Ltd., has resigned these positions and accepted that of technical director of the Eastern Dairies, Ltd., a concern having large establishments in Montreal, Richmond, Que., Toronto, Ottawa and Winnipeg. Dr. McLean is an ex-chairman of the Montreal Section, and is well known to British members as the very able and agreeable cicerone on the occasion of the general meeting of the Society in Canada.

Sir Richard Gregory, the editor of *Nature*, received the honorary degree of LL.D. at the annual graduation ceremony at St. Andrew's University. The Vice-Chancellor and Principal, Sir James Irvine, F.R.S., presided over the ceremony.

The Iron and Steel Institute has awarded the Carnegie gold medal for the year 1935 to Mr. A. L. Curtis, Westmoor Laboratory, Chatteris, in recognition of his research work on steel moulding sand etc.

The E. I. du Pont de Nemours & Co., U.S.A., has celebrated the completion of 125 years since the establishment of a power mill by the founder of the firm in 1802. The firm employs nearly 400 chemists, and spends over \$2,000,000 each year in research.

We regret to announce the death, on October 5, of Dr. W. H. Sodeau, D.Sc., F.Inst.P., who was assistant to Professor C. S. Gibson, O.B.E., M.A., B.Sc., M.Sc., in work for the Dental Investigation Committee of the Department of Scientific and Industrial Research.

Prof. Max Planck has retired after 40 years' service from the chair of theoretical physics in the University of Berlin, on reaching the age limit.

The late Mr. W. F. Newman, director of Thomas Firth & Sons, steel manufacturers, Sheffield, left £4120.

The late Mr. G. J. Graae, joint managing director of the English Margarine Works, Ltd., left £5063.

Sir Alfred Mond on the Industrial Outlook

Speaking before the London Publicity Club on October 11, Sir Alfred Mond said he thought the industrial outlook was undoubtedly improving. Far from being despondent, we had every reason to assume that, with greater stabilisation, world industry must develop and benefit, and that a great industrial country like ours must have its share in the advantages of a general increase in the consumption of the world. More remarkable than industrial difficulty and depression was the fact that the world had recovered so much during the nine years since the war. There was to-day far too great a tendency to look on trade as a kind of limited static thing, of which there was only a certain amount, so that if someone got some of it, someone else had to lose. That was not true. There were opportunities of unlimited business, and the only thing they required was a general prosperity in the world which would lead to the necessary consumptive capacity. A great deal more coal was being produced than people could consume. Thus they got insensate competition, prices reduced below an economic level, and an industry not at peace, but in strife. Unless they got a close balance between production and consumption, they would not get an even curve of returns, but a zigzag, which was the most destructive thing to industry and to real progress. The greatest economic change of the present day was that the possibility of increasing production was so much greater throughout the world that they were apt to get violent fluctuations much more than was possible in the past. People to-day were apt to talk too much about what were generally called the heavy industries. Lugubrious gentlemen, while saying that another furnace had been damped down, forgot how many more motor-cars were being built and to what extent the motor industry was developing the wealth of the country. The artificial silk industry, again, was relatively only in its infancy, and in many directions there were being continually created new industries which did not exist a short time ago. England was pre-eminently a country of high quality produce. We should always suffer more in bad times than the producer of cheap goods, but we should always make more money when times were better. He was a great advocate of aggressive salesmanship as a vital factor in British industry. Compared with America we were backward in our methods. We had waited for people to buy our goods, but aggressive salesmanship meant selling a man something he did not want. So far as British industry went, a more aggressive policy had become imperative.

The De Vecchis Desiccation Process

The first provincial meeting of the Chemical Engineering Group for the current session will be held jointly with the Glasgow Section of the Society of Chemical Industry, on October 19, at the Ca'doro Restaurant, Union Street, Glasgow, when a paper on "The desiccation (de Vecchis) process of beet sugar manufacture" will be read by C. Scott Garrett, M.B.E., D.Sc., and G. W. Riley, M.I.Chem.E. The paper describes the drying of the beet cossettes and the plant which has been specially evolved for this purpose. Economic data are given and the process is compared with other existing methods of manufacture. It will form the most

complete paper on the de Vecchis process yet offered to a scientific meeting in any country. Advance proofs of the paper are being prepared, and will be issued shortly.

British Commercial Gas Association

The 16th annual general meeting of the British Commercial Gas Association, which is the research, advisory and publicity organisation of the British gas industry, was held in Southampton on October 4, 5, 6. An interesting and varied programme was provided.

The presidential address by Sir Russell Bencraft was read on his behalf, as he was absent through sudden illness: the address dealt largely with salesmanship and advertising in the industry. Sir Bruce Bruce-Porter discussed health in relation to industry, mentioning the contribution of the gas industry to the suppression of smoke pollution, and Miss Gladys Burlton dealt with the training of gas salesmen.

Mr. R. Halkett, speaking on the commercial prospects and future co-operation of the gas industry, suggested that the smaller gas undertakings should be absorbed by the larger organisations, and the whole linked up in various amalgamations to meet the challenge of electricity. There was no reason why coke-oven gas should not be conveyed at high pressure to furnish supplies outside the colliery areas. The distances were never so great that areas could not be allotted, and a network of distribution arranged so that gas could be supplied primarily from one or two chief manufacturing stations. These suggestions were endorsed by several other speakers.

American Electro-Chemical Society in Canada

The American Electro-Chemical Society, which has been holding its annual meeting in the north-western United States, held a technical session at Vancouver, B.C., on September 13. The members arrived in Vancouver from Seattle, Wash., the day before, and were entertained to a dinner, a concert, a drive, and a sail by the civic and mining officials.

At the technical meeting, Prof. S. C. Lind, president of the Society, occupied the chair, and papers were presented by Leopold Herry, Langerbrugge, Belgium; Konrad Teufel, Leverkusen, Germany; Dr. Colin G. Fink, secretary of the society; Chas. L. Mantell, Prof. G. A. Rousch, and S. W. Burwell.

A visit was made to the Lake Butzen hydro-electric plant of the B.C.E. Railway Co., and in the evening the party left for Tadanae, Trail, B.C., to inspect the works of the Consolidated Mining and Smelting Co.

On October 15 the 20 plants at Tadanae were visited, and at the banquet, tendered by the company to the members, Dr. Lind declared the reduction plant was "the best arranged, neatest, and cleanest smelter he had ever inspected"; whilst Dr. Fink said, "There is nothing like it in the world." The new No. 1 plant of the Kootenay Power and Light Co., at Bonnington, was characterised by Monsieur Herry, Belgium, as "the most modern and best-equipped hydro-electric installation seen on the trip through the U.S.A. and Western Canada."

COMPANY NEWS

BRITISH CYANIDES, LTD.

The annual general meeting, held on October 5, was presided over by the chairman, Mr. C. F. Rowsell, who said that the heavy reduction in capital was due to the fact that the manufactures for which the plant had been erected had become unprofitable to the company. There was every reason to believe that the profits would be substantially increased by the end of the year. The most important factors in improving the company's revenue position since the commencement of the present year had been the rise in the market price of prussiate of soda and the decreased cost of manufacture owing to the reorganisation of the hours of working. Another reason was that whereas six months ago the company were indebted to their bankers for £55,000, they now had £30,000 on deposit. Agreements had been entered into whereby the whole of their output of prussiate of soda and red prussiate of potash had been disposed of until the end of 1928 on terms which should bring in a better revenue from these sources next year, thus releasing their sales organisation for other purposes. It was upon the cheap manufacture of thiocarbamide that the success of the company must ultimately depend, because, although they had patents which they believed to be master patents and to be so strong as to be practically unassailable, it was impossible to foretell the strength of any patent until it had been attacked and successfully defended; but so long as they were able to make thiocarbamide more cheaply than anyone else in the world they were independent of patents until some substitute for thiocarbamide in making their water-white resins and translucent moulding powders was found. During the past six months the company had succeeded in placing the manufacture of thiocarbamide upon a very strong economic basis. The cotton side of the business had reached an interesting stage. Successful tests on a commercial scale had been carried out, and would be followed up by commercial trials in one or other of the works of the Bradford Dyers' or Bleachers' Associations, or both. The moulding powder business was developing on sound and satisfactory lines. The company was selling powder in the United States of America and, in addition, was in negotiation with two great firms in that country (one firm being Marshall Field & Co., of Chicago) for the sale of mouldings and for the operation of their patents in the United States. Negotiations were in course for the sale of the company's powders on exclusive terms to a European country. During the last few months the company had consolidated its position in respect of the chemicals it had so long manufactured on lines which, it was believed, would be beneficial both to themselves and to the trade as a whole. (For accounts, cf. CHEMISTRY AND INDUSTRY, September 30, 1927, p. 888.)

GLENBOIG UNION FIRECLAY CO., LTD.

The profit for the year ended August 31, 1927, including £3653 brought forward, amounted to £20,118, compared with £28,153 for the previous year. The sum of £1500 has been placed to depreciation of plant and machinery (same), and £2000 (same) to reserve against taxation. A dividend has been recommended at the rate of 10%, less tax, carrying forward £4618.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS.

Acid Acetic, 40% tech. —£19 per ton.
 Acid Boric, Commercial. —Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric. 3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots, £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS.

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep. 6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 10s.—£10 per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—7½d.—8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.
 Acid Cresylic, 99/100. 2s. 6d.—3s. per gal. 97/99. —2s. 4½d.—2s. 7d. per gal. Pale, 95%, 2s. 3d.—2s. 5d. per gal.
 Dark, 90%, 1s. 9d.—1s. 10d.; 95%, 2s. 1d.—2s. 3d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 4d.—1s. 5d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/100, 9½d.—10d. per gal. Solvent 95/100, 10½d.—1s. 4d. per gal. Solvent 90/100, 9½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—84s.—90s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—7½d. per lb., naked at works.
 Aniline Salts.—7½d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.
 Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—2s. 3d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—11d.—1s. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

p-Nitraniline.—1s. 8d. per lb.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d. per lb.

p-Toluidine.—2s. 2d. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. 6d. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth

Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—

8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—

8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb.

Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Sub-

chloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—

7s. 9d.—8s. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liquor

Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—

1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s.—2s. 3d. per lb. Potassium.

1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb.

Granulated ½d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. 2½d.—1s. 4d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in car-

boys; Winchester, 2s. 11d. per gal.; 20 vols., 4s. 3d.

per gal. in carboys; Winchester, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots.

Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green,

2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—20s.—22s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less

2½%; Heavy Commercial £21 per ton, less 2½%; in

quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol—A.B.R. recryst., B.P., 17s. 9d. per lb. net.

Synthetic detached crystals, 9s.—12s. 6d. per lb., accord-

ing to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d.

per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sub-

limate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—

5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.,

Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d.

per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow

Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.

—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.

Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonat.—8s. 9d.—9s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 98s.

per cwt., less 2½%.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.;

U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—10s. 8d.—17s. 2d. per lb., according to

quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included.

F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz.

tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C.,

1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d.

per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d

consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—10s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net.
 Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 8½d.—1s. 9½d. per lb. Crystal,
 1s. 9½d.—1s. 10½d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d. 1s. 2d. per lb. •
 Sod. Sulphite, anhydrous.—£27 10s. £28 10s. per ton
 according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder 2s.—2s. 1d. per lb.
 Thymol, Puriss. 10s.—10s. 3d. per lb., according to
 quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone. 6s. 6d. per lb.
 Anabpine (*ex linalhol*).—10s. 6d. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s.
 per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl
 Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 3d. per lb.
 Coumarin.—9s. 9d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Dec. 8th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Oct. 20th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Barber. Autoclaves. 25,825. Sept. 30. Mixing apparatus, 25,826. Sept. 30.
 British Thomson-Houston Co., Ltd. Crucibles. 25,633. Sept. 28. (U.S., 1,10,26.)

Clifford. Filtering apparatus. 25,468. Sept. 27.
 Gewerkschaft Sachtleben, and Küppers. Rotary furnaces. 25,886. Sept. 30. (Ger., 5,3,27.)
 Gregson, and Gregson & Partners, Ltd. Regenerative furnaces. 25,552. Sept. 28.
 Williams. Impregnating etc. materials with liquids. 25,674. Sept. 29.

I.—Complete Specifications

15,065 (1926). Duffield. Pulverisers. (277,734.)
 15,831 (1926). Sturtevant Co. Heat-exchange apparatus. (251,702.)
 28,193 (1926). Svenska Akkumulator Akt. Jungner. Filters. (272,841.)
 29,999 (1926). Dwight & Lloyd Metallurgical Co. Treating materials. (269,480.)
 10,100 (1927). Sturtevant Co. Heat-exchange apparatus. (269,560.)
 *23,417 (1927). Internat. Combustion Engineering Corp. Distillation. (277,952.)

II.—Applications

Brand and Laing. Utilising pulverulent carbonaceous materials. 25,327—8. Sept. 26.
 British Thomson-Houston Co., Ltd. Anti sludging means for oil. 25,631. Sept. 28. (U.S., 28,9,26.)
 Hirschberg. Treatment of coal etc. 25,456. Sept. 27. Distillation of coal etc. 25,710. Sept. 29.
 Humphreys & Glasgow, Ltd. Manufacture of mixed gas. 25,513—4. Sept. 27. (U.S., 13,10,26.)
 Johnson (L.G. Farbenind.). Manufacture of liquid hydrocarbons from olefines. 25,592. Sept. 28. Recovery of hydrogen. 25,732. Sept. 29.
 Koppers Co. Coke ovens. 25,399. Sept. 26. (U.S., 27,9,26.)
 Maclaurin. 25,948. See VII.
 Masters. Vertical gas retorts. 25,843. Sept. 30.
 Patentakt. Gröndal-Ramen. Manufacture from bituminous shales of a product adapted for dry distillation. 25,861. Sept. 30. (Sweden, 2,10,26.)
 Salerni. Distillation retorts etc. 25,756. Sept. 29.
 Soc. du Gaz de Paris. Purification of gas. 25,725. Sept. 29. (Fr., 11,10,26.)
 Stredwick. Manufacture of gas. 25,795. Sept. 30.

II.—Complete Specifications

18,026 (1926). Spindler. Transforming methane into a carburetting agent similar to petroleum. (255,493.)
 25,576 (1926). Bretherick and Glossop. Low-temperature carbonisation of coal, lignite, etc. (277,819.)
 29,369 (1926). L.G. Farbenind. Destructive hydrogenation of moist solid fuels. (262,099.)
 9606 (1927). Silica en Ovenbouw Mij. Regenerative coke ovens. (269,188.)
 14,536 (1927). Chilowsky. Manufacture of gas from heavy oils. (271,907.)
 *22,181 (1927). A.-G. f. Kohlenäureind., and Auerbach. Refining or fractionating mineral oils. (277,946.)
 *23,680 (1927). Urbana Coke Corp. Treating solid fuel. (277,955.)
 *24,864 (1927). Spilker, Zerbe, and Ges. f. Teerverwertung. Hydrogenating and splitting hydrocarbons, distillation products of coals, and coals. (277,974.)
 *25,033 (1927). Perolis. Treatment of mineral oils by heat. (277,983.)
 *25,045 (1927). Daniels. Production and activation of carbon. (277,987.)
 *25,399 (1927). Koppers Co. Coke ovens. (278,012.)

III.—Application

Maclaurin. 25,948. See VII.

III.—Complete Specification

15,708 (1926). Lechler. Production of emulsion-like preparations of water in tar. (255,044.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Vat dyestuffs. 25,901—2. Sept. 30.

Johnson (I.-G. Farbenind.). Manufacture of vat dyestuffs. 25,731. Sept. 29.

Scottish Dyes, Ltd., Thomas, and Tonkin. Production of anthraquinone derivatives. 25,642. Sept. 28.

Scottish Dyes, Ltd., Beckett, Fairweather, and Thomas. 25,784. *See XX.*

IV.—Complete Specifications

15,718 (1926). I.-G. Farbenind. Producing tertiary nitriles. (253,950.)

16,052 (1926). British Dyestuffs Corp., Baddiley, Chorley, and Brightman. Manufacture of intermediate compounds and of azo dyestuffs. (277,756.)

32,841 (1926). I.-G. Farbenind. Manufacture of benzanthrone derivatives. (263,845.)

V.—Applications

Brandwood. Washing artificial silk filaments etc. 25,941. Oct. 1.

Carpmael (I.-G. Farbenind.). Protecting wool etc. from moth. 25,620. Sept. 28.

Dreyfus. Manufacture of cellulose derivatives. 25,637. Sept. 28.

V.—Complete Specifications

7306 (1926). Marks (Kohn-Rottweil A.-G.). Production of artificial fibres etc. from viscose. (277,716.)

8275 (1926). Dreyfus. Manufacture of cellulose derivatives. (277,721.)

10,688 (1926). Kershaw, Barrett, and Bleachers' Assoc. Treatment of cellulosic materials. (277,722.)

*25,063 (1927). Stubner. Manufacture of coloured or pigmented cellulose. (277,989.)

VI.—Application

Williams. 25,674. *See I.*

VI.—Complete Specification

29,897 (1926). Holliday & Co., Ltd., and Shaw. Dyeing wool and/or silk. (277,833.)

VII.—Applications

Anderson, Cash, and Stephens. Manufacture of titanium-containing compounds. 25,953. Oct. 1.

Caro and Frank. Production of metal cyanamides etc. 25,887—8 and 25,893—4. Sept. 30. (Ger., 23.10.26, 28.10.26, and 2.12.26.) Production of calcium cyanimide etc. 25,889—90. Sept. 30. (Ger., 27.10.26 and 2.12.26.)

Deutsche Gold- und Silber-Scheideanstalt, Freudenberg, and Kloepper. Production of alkali hydrides. 25,586. Sept. 28.

I.-G. Farbenind. Extracting clay etc. with acids. 25,740. Sept. 29. (Ger., 29.9.26.)

Johnson (I.-G. Farbenind.). 25,733. *See II.*

Maclaurin. Recovering ammonium and phenolic compounds from ammonia liquors. 25,948. Oct. 1.

Smith. Manufacture of cream of tartar substitutes. 25,827. Sept. 30.

VII.—Complete Specifications

17,122 (1926). Klein and Brown. Utilisation of waste acid liquors. (277,769.)

28,882 and 29,027 (1926). Omnium des Ind. Chimiques (Proc. Tocco & Landi). Production of ammonia. (262,090 and 272,842.)

4002 (1927). New Jersey Zinc Co. Manufacture of zinc oxide. (268,301.)

5378 (1927). I.-G. Farbenind. Treatment of crude nitrate of soda. (266,744.)

8892 (1927). I.-G. Farbenind. Precipitation of heavy metals from ammoniacal solutions. (269,164.)

*18,824 (1927). Haynes. Manufacture of carbon dioxide. (277,938.)

*23,552 (1927). Jungmann and Kolbert. Manufacture of a solid alcoholic solution of free iodine. (277,953.)

VIII.—Complete Specification

12,149 (1927). U.S. Metals Refining Co. Magnesite refractories. (271,847.)

IX.—Applications

Marks (International Cement Corp.). Manufacture of cement. 25,386. Sept. 26.

Palm and Thorsson. Cement compositions. 25,576. Sept. 28.

Rigby. Apparatus for cement manufacture. 25,543. Sept. 28.

Walsh. Treatment of wool. 25,583. Sept. 28.

X.—Applications

Ashcroft. Metallurgy of ores etc. 25,856. Sept. 30.

Birmingham Small Arms Co., Ltd., and Page. Colouring stainless steel. 25,554. Sept. 28.

Chapman (Chapman). Solder. 25,459. Sept. 27.

Corson. Treating alloys. 25,355. Sept. 26. (U.S., 4.10.26.)

Cushing. Metallurgical furnace. 25,382. Sept. 26.

Dietzsch. Wet extraction of copper. 25,352. Sept. 26.

Gustafsson. Producing metals in electric furnaces. 25,333. Sept. 26. (Sweden, 27.9.26.)

International Nickel Co. Chill cast-iron alloys. 25,769. Sept. 29. (U.S., 21.10.26.) Grey iron alloys. 25,770. Sept. 29. (U.S., 21.10.26.)

Johnson (I.-G. Farbenind.). Production of anticorrosive lead antimony alloys. 25,730. Sept. 29.

Lindhorst. Hardening iron etc. 25,600. Sept. 28.

Ragg and Rahtjen. Producing mixtures containing metal powder. 25,944. Oct. 1.

Taylor. Electrodeposition of metals. 25,641. Sept. 28.

X.—Complete Specification

*25,333 (1927). Gustafsson. Producing metals in electric furnaces. (278,005.)

XI.—Applications

Child, Hall, and Eton Glass Battery Co. Primary electric cell. 25,344. Sept. 26.

Gustafsson. 25,333. *See X.*

Roberts. Electric accumulators etc. 25,663. Sept. 29.

Siemens & Halske A.-G. High-frequency induction furnaces. 25,502. Sept. 27. (Ger., 10.6.27.)

Taylor. 25,641. *See X.*

XI.—Complete Specifications

12,502 (1926). Carreras. *See XIII.*

22,519 (1926). Hazlehurst. Electric batteries. (277,798.)

13,544 (1927). Comp. Franc. Exploit. Proc. Thomson-Houston. Electric dry cells. (271,496.)

*25,333 (1927). Gustafsson. *See X.*

XII.—Applications

Chapman, and Imperial Chem. Industries. Cleavage of oils and fats. 25,748. Sept. 29.

Oel und Fett-Chemie Ges. Treating tall oil. 25,393. Sept. 26. (Ger., 11.10.26.)

Verein. Chem. Werke. Elimination of smell from glycerin. 25,898. Sept. 30. (Ger., 11.10.26.)

XIII.—Applications

Azzopardi. Manufacture of printing inks. 25,774. Sept. 29.

Du Pont de Nemours & Co. Pigmented carbohydrate compound compositions. 25,390. Sept. 26. (U.S., 5.10.26.)

Kalischer. Manufacture of inks etc. 25,834. Sept. 30.

XIII.—Complete Specifications

12,502 (1926). Carreras. Manufacture of white lead by electrolysis. (277,723.)

18,840 (1926). British Thomson-Houston Co., Ltd. Coating-compositions. (257,243.)

*22,766 (1927). Stubner. Manufacture of pigments and pigmented products. (277,949.)

XIV.—Applications

Davey, Martin, and Rubber Growers' Association. Preservation of indiarubber. 25,378. Sept. 26.

Dawson, Porritt, and Res. Assoc. of Brit. Rubber & Tyre Manufs. Preservative coatings for rubber goods etc. 25,760. Sept. 29.

XVI.—Application

Caro and Frank. 25,887—8 and 25,893 4. See VII. 25,880—90. See XVI. Production of fertilisers. 25,891—2. Sept. 30. (Ger., 23 10,26 and 3.3.27.)

XVII.—Application

Varman and Wayre. Manufacture of sugar. 25,716. Sept. 29.

XVII.—Complete Specification

*15,726 (1927). Nouvelles Industries Chimiques. Recovery of nitrogen and acetone from vinasses, molasses, etc. (277,932.)

XIX.—Applications

Carpmael (I. G. Farbenind.). Protection of stored corn from vermin etc. 25,414. Sept. 26.

Salomon. Preservation of eggs. 25,611. Sept. 28.

XIX.—Complete Specification

16,441 (1926). Peck. Making nutritional beverages and food products. (254,724.)

XX.—Applications

Carpmael (I. G. Farbenind.). Manufacture of substituted guanidines. 25,413. Sept. 26

I. G. Farbenind. Manufacture of condensation products of urea. 25,475. Sept. 27. (Ger., 8.10.26.)

Johnson (I. G. Farbenind.). Manufacture of mono- or polyvalent alcohols. 25,593. Sept. 28.

Scottish Dyes, Ltd., Beckett, Fairweather, and Thomas. Production of benzoic acid etc. 25,784. Sept. 29.

XX.—Complete Specifications

17,903 (1926). Haythornthwaite, and May & Baker, Ltd. Manufacture of solutions of bismuth salts of aryl-arsenic acids. (277,774.)

25,945 (1926). Mannich. Manufacture of cyclotrimethylene-aryl-pyrazolones. (260,577.)

30,409 (1926). Mannich. Manufacture of alkyl and aralkyl derivatives of cyclotrimethylene-aryl-pyrazolones. (263,773.)

1766 (1927). Naef and Firmenich. Increasing the yield in civetone, starting from civet. (267,893.)

*24,882 (1927). German. Distillation of organic calcium salts. (277,975.)

XXI.—Complete Specification

11,727 (1927). I. G. Farbenind. Protective layers for photographic films. (270,347.)

XXII.—Applications

Dynamit A.-G. vorm. A. Nobel & Co. Production of gelatinised explosives etc. 25,478. Sept. 27. (Ger., 21.12.26.)

Holden (Rimac). Matches. 25,404. Sept. 26.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Argentina*: Stone-crushing and screening plant (A.X. 5278). *Australia*: Machine tools, cranes, steel products, anti-friction metals (275). *British India*: Paper, drugs, chemicals (276); water-pipes, caustic soda (The Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Czechoslovakia*: Tin, lead, antimony, zinc, phosphorous copper (A.X. 5301). *Lithuania*: Lubricating and cylinder oils (B.X. 3859). *Portugal*: Tinplate (292).

Rumania: Metals, leather, tinplate, ironplate, tin sheets, antimony, lead, copper, zinc (294). *South Africa*: Steel plates (A.X. 5290).

Safeguarding of Key Industries

The Treasury have made an Order under Section 10 (5) of the Finance Act, 1926, exempting the following articles from Key Industry duty from October 8, 1927, to March 6, 1928:—Didial (Ethyl morphine diallyl barbiturate); Ethylene bromide; Lead tetra-ethyl; R. Potassium hydroxide (R. Potassium caustic, R. Potassium hydrate). The Treasury Order will be published shortly.

The Board of Trade give notice that representations have been made to them under Section 10 (5) of the Finance Act, 1926, for the exemption from the duty imposed by the Safeguarding of Industries Act as amended by the Finance Act, 1926, of lithium carbonate, lithium hydroxide, and quinine ethyl carbonate. Communications regarding these applications should be addressed to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, S.W. 1, before November 11.

Merchandise Marks Act

The Standing Committee appointed by the Board of Trade to inquire as to whether imported pottery should bear an indication of origin will meet at 2.30 p.m. on October 24, and at 10.30 a.m. on October 25 and 26, at the New Public Offices, Great George Street, S.W.1.

News from Advertisements

A research assistant is required for blast-furnace reactions research at the Imperial College of Science and Technology (p. vi).

A chemical engineer is required for a large factory in the Midlands (p. vi).

A junior assistant is required by consulting chemist (p. vi).

The Imperial College of Science and Technology (Department of Chemistry) announces an additional post-graduate course in the chemistry and microscopy of food, drugs, water, etc. (p. vi).

A set of this JOURNAL is for disposal (p. vi).

A highly-trained chemist requires a junior partnership in a chemical concern (p. vi).

An assistant chemist is required for the East (p. vi).

There are now 121 firms represented in our Buyers' Guide.

No. 42

EDITORIAL

The Lamp of Unity

SIR ALFRED MOND has again called public attention to the need for industrial peace. We could all do this, perhaps not so eloquently or so skilfully, but we could do it after a fashion. He has the advantage over most of us in that he has persuaded the majority of thinking people to believe that he talks good sense, and in this particular cause, that he puts into practice what he preaches. It was said that the chief disadvantage of knowing more and seeing farther than others is not to be generally understood. We think this is hardly true of Sir Alfred Mond: he knows more and sees farther than most of us who are concerned in the chemical industry, but he has the habit of plain thinking and plain speaking, and if his remarks on industrial peace are not generally understood this cannot be due to the obscurity of his utterances. Imperial Chemical Industries, Ltd., are so important a part of the chemical industries of the Empire that their decision in labour questions is one which must be followed by all who are large enough and wise enough to do so. We have, on the whole, always had in the chemical industry of this country a happy co-operation between brains, capital, and labour. This has been largely due to the good sense and good feeling of those two pioneers of the heavy chemical industry, Dr. Ludwig Mond and his partner Sir John Brunner. The principles they laid down have been adopted, modified, improved, and extended during the last five and twenty years, and a new generation has sprung up to whom these principles are familiar, a new generation of labour, a new generation of capitalists, a new generation of scientific control. The application of these principles to the various companies in Imperial Chemical Industries is explained in their labour programme published in this week's issue, and it includes many details of considerable

interest. At the Mansion House meeting on Monday last, important speeches were made by Sir Alfred Mond, Mr. Tom Shaw, and Sir Robert Hadfield, all of whom have contributed articles to this JOURNAL. It is no mere coincidence this; the fact is that our chemical industry is a striking example of good industrial relations, and that the Central Labour Department of Imperial Chemical Industries is merely a continuation and an extension of a system which is in actual operation. Sir Alfred Mond has been the spokesman—and probably much more—of the new labour programme, his son, Mr. Henry Mond, will direct the new department. Mr. R. Lloyd Roberts, who is a successful expert in labour matters, and has for many years guided Messrs. Brunner, Mond & Co. in their labour policy, will advise the new department; we can think of no one who has had equal experience and of no one whose advice on such matters is based on equal good sense and good judgment. To create a new staff grade of workers seems, at first sight, fair and wise; how it will work out in practice we do not know, but the experiment is well worth trying, and if it turns out a success it will probably be a great success. We cannot think of any objection to it, and it certainly gives a security of tenure much greater than the very meagre security enjoyed by the average worker.

We took the title of this article from Mr. Cronsshaw's address to the Manchester Section, an address which we read with much pleasure and shall read again. We hoped that his remarks on Research, Precision, Service, Unity, Judgment, Leadership, and Vision would be an inspiration to us which would enable us to write a little. His remarks certainly have inspired us, but not to write: an address such as his has required a great deal of thought and a great deal of experience. We dare not cull a few phrases from it and comment on them hastily and light-heartedly; there are some things in

this world too good to spoil. Mr. Cronshaw's address deals with many topics, some of which may properly be considered in close relation to the topics of industrial peace and industrial fair dealing which have engaged the attention of Sir Alfred Mond. It covers, however, a much wider range of thought, and is of a very unusual and welcome type. Mr. Cronshaw has abundant experience in the manufacture of dyestuffs, and has made use of his experience in the preparation of his address, but his mental activities have been applied not merely to this industrial process, but to chemistry, to life, and to ethics. Not only is his title derived from Ruskin, but his thoughts are so replete with vision and experience that he must have learned some of the methods of study of Ruskin. We always thought that Ruskin was both a great writer and a great artist: we could never understand why he considered it desirable to constitute himself as our universal adviser. It is a satisfaction to find that his influence has inspired the chairman of the Manchester Section to deliver a first-rate address.

Marcellin Berthelot

On Tuesday next the world of science will honour the memory of Pierre Eugene Marcellin Berthelot, who was born in Paris on October 25, 1827. We are proud to think that British chemists and chemical students need but the reminder of this historic date to set their hearts vibrating in harmony with those of their friends across the Channel. Berthelot belongs by right of birth to France, but his influence upon the science of chemistry remains a heritage to all nations. During his lifetime Berthelot was honoured by British chemists no less than by his own countrymen and his memory will be revered in this country so long as the science of chemistry has any being. The British chemist may have the reputation of taking his work too seriously, his pleasures too sadly, and his great men too much for granted, but he has a depth of sincerity in his nature which will not allow him to scatter complimentary phrases indiscriminately. We were never more sincere than we are at present when we ask our French colleagues to allow us to join with them in paying a glorious tribute to the memory of Marcellin Berthelot.

Berthelot lives in our memory chiefly as a master of fundamental research, for during his 57 years of strenuous work he published over a thousand original papers from L'Ecole Supérieure de Pharmacie de Paris and the Collège de France. His work may be broadly divided into four groups, namely: synthetic chemistry, thermo-chemistry—a branch of the science which he may be said to have created—agricultural chemistry, and historical chemistry. We ourselves think of him most of all as a synthetic chemist, for, although his work in other directions and his researches and literary efforts in the realm of Egyptian alchemy were truly brilliant, he laid the foundations of our amazing modern edifice of synthetic organic chemistry. At a time when organic chemistry was only just escaping from the thralldom of belief in a *vis vitalis*, Berthelot performed miracles with the aid of carbon, hydrogen, and oxygen. His syntheses of acetylene, benzene, methane, formic acid, ethyl alcohol, and other compounds considered so simple in

constitution to-day as compared with, shall we say, indigotin, muskone or thyroxine, represented in his day veritable triumphs of chemical skill, and exercised a powerful influence upon the progress of chemical science. He showed how it was possible to prepare "une multitude de corps nouveaux semblables ou supérieurs aux produits naturels," and yet he never took out a single patent. His joy was in his work and in the benefit which it would confer upon his country and the world at large. His love for France was deep, and his public services as Minister of Public Instruction and Minister of Foreign Affairs and in many other directions were distinguished by care, thoroughness, and whole-hearted effort. The influence of Marcellin Berthelot and of his family of distinguished sons and daughters upon politics, chemistry, philosophy, and diplomacy will long remain.

It was a happy inspiration on the part of the French chemists to make the Berthelot celebration the occasion for a world-wide co-operation between chemists. There are undoubted difficulties to be overcome before all their projects can be realised, and we are not sure that the scheme of enlisting the assistance of the Governments of the world for the particular purposes of *La Maison de la Chimie* was the best way of securing the sympathy of the chemists of some of the countries. Nevertheless we treasure the memory of Marcellin Berthelot, and we honour his countrymen for their desire to associate his name with every celebration and every memorial that they consider will promote the advancement of the science to which Berthelot contributed so largely.

The Supermiser

We are not responsible for the name given to a new means of heat conservation which appears to be a useful adjunct to boilers of the Lancashire type. The Supermiser is a combination feed-water heater and air pre-heater, and consists broadly of a set of concentric tubes. The innermost tube takes the feed water which is heated by the hot combustion gases passing to the stack through the annular space between the innermost tube and the outer annular space. Through the latter is forced cold air which thus becomes pre-heated on its way to the combustion zone. In addition, the hot combustion gases circulate outside the series of concentric tubes and all gas velocities are maintained high. Simple but effective heat interchange results, and the whole apparatus is of a robust character. The results obtained with the Supermiser, we are informed, approach and perhaps equal those demonstrated in large boiler installations where the installation of air pre-heaters is more general. Thus it is claimed that with Lancashire boilers operating with mechanical stokers, the flue gases can be reduced at the base of the stack to 250° F., whilst at the same time the feed water is raised from 120° F. to 240° F. The air passing to the combustion zone becomes pre-heated at 350° F.

If plant of the type described in outline above can be economically installed in relatively small boiler houses the steam-raising efficiencies of the latter should be considerably increased for, as we have indicated upon former occasions, the value of pre-heated air does not begin and end with the recovery of heat otherwise wasted in the stack.

THE LABOUR PROGRAMME OF IMPERIAL CHEMICAL INDUSTRIES, LTD.

Below we give details of the Labour Programme of Imperial Chemical Industries, Ltd., to supplement the General Statement by Sir Alfred Mond on October 7. of which we gave an account in our previous issue.

I.—CENTRAL LABOUR DEPARTMENT

To give effect to the purpose of having a common Labour policy throughout all the works of Imperial Chemical Industries, Ltd., a Central Labour Department has been established. It will be under the direction of Mr. Henry Mond, one of the executive directors of the company, who will have as his Chief Labour Advisor Mr. R. Lloyd Roberts. Its exclusive purpose will be to deal with all questions affecting the relations between the Company and its workers. It will be administered by specialists and will have the assistance of an Advisory Committee, consisting of those officials of the constituent companies whose duty it is to administer the labour policy at the various works. This Committee will secure the necessary interchange of view, between those who frame the policy and those who execute it.

II.—WORKS COUNCILS

Works Councils, which have already worked with great success in the works of one of the constituent companies, will be set up in all the works of the combine. These Works Councils, which will be of three forms, will provide a direct link between the Board of Imperial Chemical Industries and the workers in the remotest works, and will be representative equally of the management and of the workers.

(a) *The Local Works Council* consists of an equal number of management representatives and of workers' representatives from one works, and deals with all local matters affecting the workers at that works. It meets at a fixed time and date each month. The workers, therefore, know that there are regularly fixed and officially appointed occasions when they have the opportunity of raising any matter for discussion with the local management. The meetings also provide opportunities for the management to inform the workers on such questions as the output and programme of the works, and general matters affecting the industry.

(b) *The General Works Council* is similarly constituted of an equal number of management representatives and of workers' representatives, but its members are appointed from and by the various Local Works Councils of the workers of that constituent company. Thus, the Local Works Councils from works of the Brunner Mond, Nobel, British Dyestuffs and the United Alkali groups each appoint a General Works Council for their respective group. The functions of the General Works Councils are similar to those of the Local Works Councils, but matters of general interest to the workers of the whole group of works are dealt with, instead of purely local matters affecting a particular works.

(c) *The Central Works Council* is also similarly constituted of an equal number of management representatives and of workers' representatives, but its members

are appointed from and by the General Works Councils. It therefore is a body fully representative of the management and of the workers of the whole of Imperial Chemical Industries, Ltd. Its chairman is the chairman of the combine. It is intended that the Central Works Council shall meet regularly in London to discuss any matters raised by the workers, and to give the directors the opportunity to consult and discuss with the workers on questions affecting their general well-being.

The three different classes of Works Councils enable the management of the individual works, the higher management of the groups of works, and the directorate of the Combine respectively, to establish the closest possible contact with all ranks of workers. From this close contact all the co-partners in industry, the industrial trinity as Sir Alfred Mond has elsewhere described them, can co-operate effectively in making a success of the company they all serve, and thereby making their own work still more certain and secure.

III.—WORKS MAGAZINE

Again, in order to maintain and increase contact and consultation between all the co-partners in the prosperity of the company, a monthly sixty-four page illustrated magazine is to be established, which will deal with all matters of interest to the workers, particularly on their social activities. It is felt that this periodical will acquaint those engaged in the operations of the company from one end of the country to the other with the doings of the others employed, and will make them all feel they are a band of brothers.

IV.—STAFF GRADE OF WORKERS

A staff grade of workers is to be established for the purpose of giving the best workers a greater economic security and a higher status than they have had previously. All men of five years service and over will be eligible for promotion to the staff: such promotion to be made annually by the directors. It is contemplated that even up to 50 per cent of the men eligible may be promoted. Those promoted will be paid a weekly wage instead of an hourly rate and will receive the following in addition:—

- (a) A month's notice of termination of employment.
- (b) Payment of wages for Bank Holidays even if not worked.
- (c) Payment of full wages (less National Health Insurance Benefit) for all certified sick absence up to six months in any year.

V.—WORKERS' SHAREHOLDING SCHEME

For the purpose of encouraging all ranks of workers to obtain direct financial interest in the company a Workers' Shareholding Scheme to be applied in which the following are a number of the points:—

- (1) The worker may any day purchase Imperial Chemical Industries Limited ordinary shares at 2s. 6d. below the mean market price.
- (2) Free shares will be presented on the following scale:—To workers receiving £200 a year or less one free share for every 4 shares bought; from £201 to £500 a year one free share for every 5 shares bought; from £501 to £1000 a year one free share for every 6 shares

bought; from £1001 to £1500 one free share for every 7 shares bought; from £1501 to £2000 one free share for every 8 shares bought.

(3) If the worker should die before completing his payments, which may be by instalment spread over two years, the company will take over his obligations and hand the shares fully-paid to his next-of-kin.

(4) The scheme is intended as an Investment Scheme, and while no absolute restriction is placed upon the workers, they will not be expected to speculate with their shares. The Directors naturally reserve the right to refuse to allot further shares to a worker who does not enter into the right spirit of the proposal.

(5) The maximum individual allotment to be such number of shares as can be purchased by an expenditure of a sum not exceeding 20% of the annual wages or salary of the employee. To this 20% may be added an additional 1% for each year of service above five. An employee with 20 years' service therefore may spend 35% of his wage or salary etc. etc.

PEACE IN INDUSTRY

At the invitation of the Lord Mayor of London, a conference of employers, labour leaders, and officials of the Brotherhood Movement was held at the Mansion House on October 17 to consider what could be done to secure peace in industry.

Sir Thomas Inskip, Solicitor-General, said that the essential condition of peace in industry was mutual confidence as to the conditions of industry.

Mr C. G. Ammon, M.P., said that there must be give and take. Trade unions and employers' organisations had, in a certain measure, reached the limits of their development along the old lines. Such terms as masters and men were no longer suitable; they must be co-operators. There should be increasing opportunities for training workers in management and administration, and a frank recognition on both sides that agreements should be honourably observed. The present haphazard system of fixing wages must go. Regard should be had to the trade and industry of the whole country. General conferences should be held between the management and the workers at which all the relevant factors should be reviewed by both sides.

Sir Alfred Mond, M.P., emphasised the importance of eliminating politics from industrial discussions. He said that he was glad to see, from the Trades Union Congress, a strong movement to eliminate political verbiage from industrial discussions. When the Trade Disputes Bill was under discussion Sir Leslie Scott and he put down an amendment by which, if a trade dispute in any essential service could not be mutually settled either party could apply to the Ministry of Labour for the appointment of a board of conciliation and investigation. With such machinery public opinion, instead of being belogged, would have before it a decision as to who was the aggressor. If a sanction were asked for, his reply was that the great sanction in the modern world was the human conscience. People did not realise sufficiently the loss caused to industry, not merely by spectacular labour disputes,

but by the mass of continual small stoppages. The whole of our industrial future would be jeopardised unless we could obtain a steady, continuous programme of production and development in this country. In the company with which he was associated they had not had a labour dispute during 53 years. Those who initiated that industry did, as a matter of course, many of the things which Mr. Ammon had mentioned. On the whole, the British workman was reasonable if he realised that he was being given a fair deal. Referring to the scheme of works councils which he recently published, Sir Alfred Mond laid stress on the importance of organisation which would ensure that contact was maintained between those at the top of a great combination and the workers whom they employed. His experience was that the operation of works councils was all to the good. They helped to remove friction and to enable people to understand each other's point of view. The question how to create industrial peace was fundamental to the future well-being of this country. They wanted a definite programme accepted and carried out by the people. The moment was ripe for a real step forward. The scheme should be kept entirely out of party politics. They wanted something so strong that every party would have to accept it; something so sound that the common feeling of the nation would insist on its being implemented. Low wages and long hours, as a remedy for industrial depression, was a retrograde step. He wanted high production, cheap costs, and high wages.

Mr. T. Shaw, M.P., said that as a national body to lay down a programme had been suggested, he would point out that a National Industrial Council had formerly been set up, but it was scrapped by the Government of the day. The only basis on which industrial peace was possible was a decent livelihood for the workers.

Sir Robert Hadfield, F.R.S., said that the strong federations now existing on both sides were not elastic enough, and did not sufficiently study the human factors involved.

CANADIAN PULP AND PAPER INDUSTRY

An amalgamation of the selling organisations of 11 large Canadian newsprint manufacturing companies has been formed under the name of The Canadian Newsprint Co., Ltd. The company will handle 5000 tons, the daily output from the following companies: -Laurentide Co., Ltd.; Price Bros. & Co., Ltd.; Port Alfred Pulp and Paper Corp.; St. Maurice Valley Corp.; Canada Paper Co.; St. Anne Paper Co., Ltd.; Spanish River Pulp & Paper Mills, Ltd.; Fort William Paper Co., Ltd.; Abitibi Power & Paper Co., Ltd.; Manitoba Paper Co., Ltd.; and Anglo-Canadian Pulp & Paper Co., Ltd.

The Nova Scotia Wood Pulp & Paper Co., Ltd., Charleston, N.S., has been taken over by the Scott Paper Company, of Chester, Pa., U.S.A. The works will be enlarged later in the year.

The Backus interests have started the construction of a 200-ton paper mill at Fort William, Ont. This will form the first unit of a large paper establishment.

A RECENT DEVELOPMENT OF SPRAY DRYING

By J. ARTHUR REAVELL, M.I.Mech.E., M.I.Chem.E.

(Concluded)

Two typical spray-drying plants will now be described which are working under different conditions.

The spray drier is being very successfully employed in connexion with a patented process for the manufacture of a metallic oxide. The raw material in this case is a solution of the metallic salt, which, after drying, is calcined to give the oxide. The waste gases from the

and silver plating is the method that has been adopted with complete success. This plant is producing about 3 cwt. per hour of dry powder, this being removed from the drying chamber and transferred continuously to the calcining plant.

In another type of plant (Fig. 11) it is necessary to use a supply of clean air, and in this case, the material being stable, fairly high temperatures can be safely employed. For this plant an oil-heated air heater raises the air to a temperature of about 240° C., the air leaving the plant at about 100° C. Owing to the low vapour pressure of the moisture in the partially-dried

FIG. 11

calcining plant are used as the heating medium. The calciners are coke-fired, and the flue gases, after serving for the calcination of the salt, are taken, together with a quantity of excess air, to the air distributors of the spray-drying plant. The temperature of the gases at the inlet to the air distributor is between 250° C. and 300° C., and by evaporation of the solution which is fed to the drier the gases are reduced to a temperature of about 90° C. before they are discharged to the atmosphere. The solution contains a small quantity of free acid, but the only parts of the plant which come in contact with it are the feed pipes to the atomiser and the atomiser disc itself. There is no difficulty in protecting these,

material, it is found advisable to maintain the exit air temperature rather higher than would be necessary for most other products.

THE ECONOMICS OF SPRAY DRYING

In dealing with the economics of the process, the main factor to consider is the provision of the necessary heat for evaporation. At first sight it would appear that the limiting condition for the use of air as a drying medium is the saturation of the air by moisture at the air exit temperature of the plant. If, however, the moisture saturation curves for air are considered, it will be seen that the saturation value rises rapidly when

Where K = calories per 1° C. mean temperature difference per m^2 per hour and K_1 , K_2 and K_3 are the heat transfer coefficients for the two films and the dividing wall respectively.

With heat transfer between steam and air, conductivity of the wall is usually so much greater than the films that it may be neglected, and we may write

$$K = \frac{1}{\frac{1}{K_{\text{air}}} + \frac{1}{K_{\text{steam}}}} = \frac{K_a \times K_s}{K_a + K_s}$$

The required heating surface

$$S = \frac{\text{calories transmitted per hour}}{K \times \phi_m}$$

where ϕ_m is the logarithm mean temperature difference between the air and the heating medium.

Thus the surface is proportional to

$$\frac{K_a + K_s}{K_a \times K_s}$$

In tubular steam-heated air heaters, the values of K_a and K_s are in the order of 30 and 5000 respectively, and it will be appreciated that the controlling factor is the air film resistance which must be reduced as much as possible, e.g.:

Let $K_s = 5000$ $K_a = 30$
where the suffixes s and a refer to steam and air respectively.

$$\text{Then } K = \frac{5000}{\frac{5000}{30} + 30} = 30 \text{ (approx.)}$$

now let $K_s = 1000$ and $K_a = 15$

$$\text{then } K = \frac{1000}{\frac{1000}{15} + 15} = 15 \text{ (approx.)}$$

Thus, when heating air there is little advantage to be gained in employing high steam velocities, whilst every effort should be made to obtain the highest practicable air velocity in order to reduce the air film resistance.

The main sources of heat supply available commercially are:

- Steam.
- High temperature oil circulation.
- Flue gases
- Direct firing.
- Electricity.

HEATING WITH SATURATED STEAM

Steam is undoubtedly the best medium for heating the air up to temperatures of about 130° C., employing steam pressures of 60 lb. (t. 153° C.) to 120 lb. per sq. in. (t. 176° C.).

The advantage gained by using higher pressures is the larger mean temperature difference obtained, thus reducing the heating surface. The heat transfer from saturated steam to a metal wall is extremely high, thus the heating surface is reduced to a minimum.

The only practical disadvantage of steam as a heating medium is that we are limited to pressures of about 120 lb. per sq. in., as higher pressures would necessitate the use of air heaters of special and costly design.

The following table shows the effect of steam temperature on the amount of heating surface required:—

Steam pressure gauge	Temperature	Mean temperature difference ϕ_m	Heating surface
lb./sq. in.	$^\circ$ C.	$^\circ$ C.	
120	176	92	100
100	170	85	108
80	162	75	123
60	153	64	144

At first sight it may appear that the air could be heated to higher temperatures if superheated steam were used. Unfortunately, superheated steam is not nearly so good a transmitter of heat as saturated steam, and a much greater surface in the heaters would therefore be required to maintain the temperature. This fact, which is generally recognised by steam users, has received experimental confirmation in the work of R. Poensgen, at the Munich Technical College.*

In these experiments superheated steam was passed at velocities varying from 8 to 49 ft. per sec. through weldless steel tubes $3\frac{1}{4}$ in. and $1\frac{1}{8}$ in. inside diameter and $4\frac{1}{4}$ in. and $1\frac{1}{2}$ in. outside diameter, the tubes having a length of $11\frac{1}{2}$ ft. The steam pressures varied from 15 to 132 lb. per sq. in. absolute, and the steam temperatures from saturation to 350° C. (662° F.). Briefly, these experiments showed that the highest value of heat transfer from the steam to the metal wall at a pressure of 120 lb. gauge, absolute, 200° C. of superheat and a velocity of 29 ft. per sec. was $K_s = 180$.

Whilst with steam at a pressure of 30 lb. per sq. in. and a velocity of 8 ft. per sec. and 100° C. superheat a value of K of about 20 was obtained. The corresponding value for saturated steam lies between 5000 and 10,000 whilst the value of K_a may vary between 30 and 90, so that in practice the use of superheated steam would reduce the overall coefficient by half, thus doubling the heating surface.

A second, and perhaps more important, objection to the use of superheated steam is that the superheat is only a small fraction of the latent heat, so that if a given quantity of air is first heated to a temperature approaching the saturation temperature of the steam, the further rise in air temperature due to superheat will be quite small.

An example will make this clearer. Steam at a pressure of 120 lb. per sq. in. gauge (176° C.) is superheated to a total temperature of 344° C. The latent heat (491 calories) given out in condensing 1 kg. of steam will heat about 14 kg. of air from 15° C. to 160° C., whilst the superheat will only raise its temperature a further 39° C. It would be necessary to increase the heating surface by 32% to obtain this additional increase of 14° in the air temperature. This is illustrated graphically in Fig. 14.

HEATING BY MEANS OF HOT OIL CIRCULATION THROUGH THE AIR HEATER

Let us now consider the means available for heating the air to temperatures higher than 130° C.

The employment of hot oil circulating through the tubes of the air heater forms a ready and easily-controlled

* R. Poensgen, *Forschungsarbeiten*, Vols. 191 and 192, Berlin, 1917. "Ueber die Wärmeübertragung von strömenden überhitzten Wasserdampf an Rohrwandungen an Wasserdampf." Published for the V.D.I. by J. Springer.

method of heating. Oils of a special grade having a high flash point may be circulated through the air heater at 290°C ., heating the air to within 20° .

Some advantages of this method are:—

1. High air temperatures can be obtained without difficulty.
2. The low pressure of oil in the heater (in the order of 15 lb. per sq. in.) simplifies the construction of the air heater.
3. Easy regulation of the temperature.
4. Smaller heating surface required.

As any convenient velocity can be chosen for the oil flow through the pipes, a high overall heat transfer coefficient may be obtained, which, together with the large mean temperature difference, causes the heating surface required to be comparable with that for steam heating.

ture of an economiser tube is at sensibly the same temperature as the water, whilst in the case of the air heater the temperature of the metal tubes is nearly a mean of the gas and air temperatures, and is thus usually well above the dew point.

HEATING WITH DIRECT FIRING

(Air passing through tubes)

At first sight it would appear that direct heating of the air would be very efficient, as by suitable design the radiant heat could be utilised as in the case of a steam boiler. There are, however, in practice many grave objections to this method.

(a) It is difficult to prevent localisation of the heat, which causes rapid deterioration of the tubes unless these are made of a special heat-resisting metal.

It may be objected that a direct-fired absorber for

FIG. 14

HEATING WITH FLUE GASES

When large quantities of waste gases are available, this is undoubtedly the cheapest method of heating, but necessitates the provision of a very large heating surface due to the very low heat transfer between a gas and air. Broadly speaking, the surface required is more than double that of a heater using oil or steam as the heating medium. In addition, the formation of soot and other deposits from the gas further reduce the efficiency of the heating surface.

Fortunately there is little danger from corrosion due to condensation, such as often occurs on the outside surface of economiser tubes when the gas is cooled below dew point. This is due to the fact that the wall tempera-

oil or a tubular boiler is subjected to a similar condition, but the cases are in reality quite different. In a water boiler tube or oil heat absorber the tube temperature is little higher than the steam or oil temperature, whilst an air heater tube is at approximately the mean temperature between the furnace and air.

(b) There is a difficulty in regulating the temperature as there is no storage such as is in a boiler. This renders efficient firing and the maintenance of a steady temperature extremely difficult.

ELECTRICITY

Whilst the efficiency of electrical heating is from a purely thermal standpoint exceedingly high, it is ruled out on account of cost, except in cases where extremely

cheap water power is available and coal or other fuels are not easily obtainable.

A moment's consideration will show this, *e.g.*,

1 Kilowatt-hour = 3414 B.Th.U. This power, if passed to an electric air heater, would heat 69.5 lb. of air from 15 to 130° C., assuming 95% efficiency of heating. If, instead, steam were employed at a pressure of 60 lb./sq. in. (latent heat 915 B.Th.U. per lb.) efficiency 95%, 4 lb. of steam would be required.

Assuming coal of a calorific value of 11,000 B.Th.U. per lb., 70% overall boiler efficiency.

$$\therefore \text{The equivalent coal} = \frac{4 \times 915}{11,000 \times 0.7} = 0.474 \text{ lb.}$$

Thus, 1 B.O.T. unit of electricity would be equivalent in actual air heating value to less than $\frac{1}{2}$ lb. of coal. Therefore electricity at 1d. per unit is equivalent to coal at £18 11s. per ton.

The choice of the above-mentioned methods for heating air will naturally depend upon local conditions. In many works there is available a surplus of steam at pressures ranging from 60 to 100 lb. per sq. in. and in such cases the best method undoubtedly is to heat the air in steam heaters to about 130° C., and after to heat to 240° C. by means of hot oil.

It has been suggested to use the flue gases leaving the steam boilers, but here we are faced with the difficulty that if the boiler plant is efficient, the exit temperature of the gases is so low that it is difficult to obtain sufficient temperature drop to carry out heating to a high temperature.

In describing a plant in which a metallic salt is being dried the use of waste gases was mentioned, these gases being taken direct into the drying chamber. This naturally provides the most economical source of heat that could be obtained, as the spray drier can be operated quite satisfactorily with gases at the temperature at which they would normally be allowed to escape to waste; thus the cost of the heat is that of conducting the flue gases to the drying plant. The use of this method is limited to plants where the products will not be adversely affected by the presence of impurities, although where the gases originate from oil or producer gas-fired furnaces it is not difficult to arrange matters so that extremely little ash dust passes forward to the spray drier.

Products of combustion will contain considerably more moisture than heated air, but if the moisture content is so great that it is necessary to work with a relatively high air-exit temperature, this is not a serious matter. If any other source of heat were being utilised it would be important to work with the lowest possible air exit temperature in order to obtain the highest heat economy in the plant, but where waste heat is being used such economy is of little or no importance.

TYPE OF HEATERS EMPLOYED

For heating by means of oil or steam, the most efficient type is that in which the steam or oil passes through rows of tubes or passes over the outside of the tubes in a direction at right angles to the tube length. In this type high velocities of the oil and steam can be maintained inside the tube, whilst considerable velocity can also be given to the air passing over the tube surface.

For heating with flue gases the heaters may be built up in a similar design to steel economisers, the air passing through the tubes, whilst the flue gases pass outside at right angles to the tube length. Alternatively, they may be arranged as a nest of tubes in a cylindrical body, the air passing through the tubes while the gases pass in a sinuous course through the body, baffle plates being fitted at intervals. Suitable openings are provided so that the tubes can be brushed.

In this design the air can be given a high velocity through the tubes so that a high heat transfer is obtained from the air to the tubes, whilst flue gases, owing to the larger space in the jacket, pass through at a relatively low velocity. It is difficult in practice to obtain a high velocity from the flue gases, as one is usually limited by the amount of chimney draught available. In many cases, however, it may be possible to employ forced-draught fans.

The following example illustrates the advantages of using high air temperatures in the spray-drying plant. A greater proportion of the temperature drop is utilised, whilst, in addition, the weight of air for a given evaporation of water in the drier is reduced; *e.g.*, 1 kg. of air at 15° C. is raised to 130° C. and is cooled in passing through the drier to 70° C.

$$\text{Thus, heat given to the air} = 0.238 \times (130 - 15) = 27.4 \text{ calories.}$$

$$\text{Heat utilised in the drier} = 0.238 \times 60 = 14.28 \text{ „}$$

$$\text{Heat rejected} = 13.12 \text{ „}$$

If, on the other hand, the air has an inlet temperature of 240° C. and an exit temperature of 80° C., and the same heat (14.28 calories) is utilised in the drier, the

$$\text{quantity of air is reduced to } \frac{14.28}{160 \times 0.238} = 0.374 \text{ kg.}$$

$$\text{and the heat rejected} = 0.374 \times 0.238 \times 65 = 5.78 \text{ calories.}$$

Therefore, by increasing the inlet temperature we reduce the weight of air by 62% and heat loss by $\frac{5.78}{13.12} = 44\%$. In addition, the size of the drying chamber may be reduced considerably, as the rate of heat transfer from the air to the atomised liquid will be greatly increased.

Power represents a very small item in running costs. The power required for the atomiser dealing with a given volume of liquid is not constant, and varies with the degree of atomisation that is required and the nature of the liquid that is being atomised. The viscosity and the specific gravity of the liquid must be taken into account in calculating the power which will be necessary, and, as the viscosity in particular is usually materially affected by the temperature of the feed liquor, this also must not be neglected.

For plants which are dealing with quantities of about 150 gals. per hour it may be taken, in general, that the power for the atomiser will not exceed 5 h.p. For smaller plants it is naturally lower.

The power required for the fans can only be determined by consideration of each particular installation. The resistance to be overcome in the spray-drying chamber itself and in overcoming the resistance of the air-filtering part of the plant is not great, as the pressure within the drying chamber is seldom greater than about 3-in.

water-gauge *pression*. There may be an additional but smaller resistance, due to the air heater, but in other cases the resistance of the spray-drying chamber and the dust-collecting plant represents the total pressure against which the air is to be delivered.

For a plant which is evaporating about 3 cwt. of water per hour, in which the total resistance may rise to about 5-in. water gauge, the power required for the fan will be approximately 6 h.p. Thus it will be seen that the cost of power for the drying process is very low, particularly when it is compared with the cost of the power required for other processes in which grinding plant follows the drying plant. The finished product from the spray drier is already in the form of a fine powder, and there is no necessity for grinding or screening.

Labour is the remaining item in the working costs, and when it is pointed out that one man can quite easily attend to the filter bags of several drying plants, if the lay-out of the plant has been suitably arranged and the same man can attend to the removal of the powder from each of the drying chambers, it will be seen that the labour costs are reduced to an absolute minimum.

CANADIAN INDUSTRIAL NOTES

The Hamilton By-Products Coke Ovens, Ltd., Hamilton, Ontario, is erecting a plant for the recovery of benzol and toluene, at a cost of about \$400,000. It will take care of the by-products of the daily carbonisation of 1000 tons of coal.

The H.M. Doherty Company, of New York, has abandoned boring for oil on Prince Edward Island. The company has expended about \$400,000 on borings, one of which reached nearly 6000 ft., but failed to discover any gas or oil.

British financial interests have acquired the plant of the Lignite Utilisation Board at Bunfuit, Saskatchewan, and will start operations at an early date. The Board expended over a million dollars upon this plant.

The International Paper Company has announced that it will not enter the field of rayon manufacture, and has no financial interest in any company making rayon. It is solely interested in the manufacture of sulphite cellulose pulp suitable for the production of high-grade rayon. The company has purchased the Ottawa-Montreal Power Company, which gives it the control of hydro-electric power in the Ottawa Valley, reaching as far as Montreal Island. This system will be linked up with the Gatineau Power Company, and make power available for industrial development.

The Procter and Gamble Company of Canada, Ltd., soap manufacturers, is increasing its works at Hamilton, Ontario, and making general arrangements for increasing production. The cost for the improvements will approximate \$300,000.

Revised figures, prepared by the Dominion Bureau of Statistics, show the production of asbestos in Canada, for the year 1926, as 279,403 tons, valued at \$10,099,423, with an average value of \$36.15 a ton as compared to \$32.82 in 1925. Fourteen plants reported as against 12 in 1925. The total exports were 277,991 tons, of which 224,334 went to U.S.A., 14,193 to Germany, and 9304 tons to Great Britain.

THE SEVEN LAMPS OF CHEMICAL ENTERPRISE*

By C. J. T. CRONSHAW, M.Sc.

The path of chemical enterprise is both long and sinuous, and beset with pitfalls; it must, therefore, be of importance, and moreover of interest, to such a centre of chemical industry as the Manchester Section, to consider the lamps which illuminate the route so many of us must travel.

The chemical industry in this country, particularly the organic chemical industry, has been for a decade and a half the ambit of much careful analysis and diagnosis, and has possibly suffered somewhat from such critical aid. Usually the results of such diagnosis have been confined to the single theme of the importance of research in chemical industry, but, as I hope to show as I proceed, successful chemical enterprise is much more complicated than an equation with one unknown. There are many principles involved, perhaps not all of equal importance, and the neglect of any of these lays bare penalties which may easily disturb and wreck the whole structure. Chemical enterprise is to some extent peculiar; in few realms of commercial endeavour is the liability to economic changes of such capital and vital importance.

The possible routes to chemical substances are usually both numerous and varied, and the ultimate choice is made, perforce, on general economic grounds. Consequently slight changes in price of a few products are sufficient to upset almost a section of chemical industry; and this same economic trend may often, further to complicate the position, bring new products into extended use. Moreover, economic factors often play strange tricks, converting useless by-products into the salvation of a moribund industry, and relegating hitherto profitable materials to the background. As the science of chemistry grows and expands, it robs, and even as it robs it bestows, not unfortunately always on its early victims, great and glittering prizes.

Perhaps these generalisations will more gracefully commend themselves to you supported by some of the specific examples upon which they properly stand. There are many cases which may be cited. The coal-gas industry is probably the classic example. An industry which originally found its initiative in the provision of an illuminant now holds its place, at any rate in coal-bearing countries, by reason of the financial rewards in its coal tar and ammoniac. Even this sequence is on the threshold of disturbance by reason of the advance of synthetic ammonia, and it may be that ultimate and final relief is coming by way of low-temperature carbonisation. And this latter may also constitute a threat to the raw materials of the dyestuffs industry, since the tendency is for by-products to change from an unsaturated character to saturated. The dyestuffs industry almost exists on the presence of the double bond. The production of metallurgical coke has passed through the same stages and has found the same solutions. One might also quote, though not quite with the same force, the soap industry and glycerin.

And that these examples are not solely of the past,

* Chairman's Address to the Manchester Section on October 7, 1927.

there is the production by fermentation, during the war, of acetone with its then almost useless attendant accumulation of normal butyl alcohol. To-day this process flourishes and lives by reason of its butyl alcohol, and the nitro-cellulose lacquer for motor-cars is the result. There is, too, the striking development of phthalic anhydride, and the synthesis of anthraquinone. Similar instances will, of course, readily come to mind. I would, however, like to mention one other example, somewhat different from others I have recalled to you, in that the threat that emerged from the darkness was neither the inexorable progress of science, nor the shifting of economic trend, but entirely due to national politics. I mean the position of the distilleries in the United States when prohibition became law. New solvents were developed on an abundant scale; the use of alcohol as an anti-freeze in the radiators of motor-cars extended, and the so-called solidified alcohol as a solid fuel became almost an industry in itself. It was an industry with its lines of communication severed, but it took as its safeguard against this danger, the safeguard which chemical enterprise must always, for all dangers which lie hidden in the future, take, and that is, the "Lamp of Research."

RESEARCH

Research has, at various times, been divided into all sorts of categories. People have spoken of pure research, applied research, technical research, and sometimes of research in capital letters, and with almost a supernatural awe in the voice. That sort of research I am persuaded is the least valuable, and on careful inspection it usually turns out to be a vague theory that research is inherently so valuable it should be undertaken on a vast scale, and with little or no thought either for its quality, or its aims.

"The progress of any science," as Lord Curzon observed, "will always depend upon the character and ability of the men who devote their life to it, rather than the money expended in its name."

Pure research as I understand it means the prosecution of experiments or enquiries solely directed towards the acquisition of knowledge for its own sake. No reasonable person who derives his income mainly from the practical applications of science, or who has received a scientific training, will for one moment deny the value or the need for such research. It is important in that it is fundamental for the progress of the world and the training of subsequent generations of chemists, but it is no part of the duty of chemical enterprise to do other than extend a financial helping hand to pure research.

It is the business of the horticulturist to set his seeds and grow his plants in the soil and atmospheric conditions best suited to their full fructification. There can be no question at all that the soil and atmosphere best suited to pure research is and always will be the universities. Anyone who really has strong and deep convictions about the fundamental and cardinal importance of this kind of research will do well to hesitate before advocating its removal to other soil of necessity less suited to its abundant development.

With technical or applied research, chemical enterprise is, of course, mainly concerned. It is, as I have said, the lamp to illuminate the darkness lying in the future.

Its importance has quite properly been stressed in every public critical analysis to which chemical enterprise has in the past been subjected; but this repeated emphasis has only, in my opinion, been rightly necessary because of the danger, since the results of research must necessarily lie in the future, of its being abandoned altogether. Thus both the value and danger of technical research arise because it is concerned with the future, and the shortsighted have sometimes yielded to the apparent necessity of the present.

No matter of research is easy, but technical research is, quite apart from the inherent obstacles of the specific problems, a matter of some difficulty, in that there is no easy measuring stick to hand with which to test its excellence; no ready criterion of the amount of expenditure necessary; often no surety of ultimate reward; no positiveness that the goal really exists; and because of all these, I feel that the supreme difficulty in technical research is the difficulty of its wise direction. Sir Ernest Rutherford, at the British Association in Liverpool, speaking of this same difficulty of direction, remarked that "it is fatally easy to spend much money in a direct frontal attack on some technical problem of importance when the solution may depend on some addition to knowledge in some other field of scientific enquiry which can be gained possibly at a trifling cost."

Stripped of its technical obstacles, applied research is therefore a problem of marksmanship. Just as the fighting efficiency of a battleship depends firstly upon good guns, the right ammunition, and efficient shooting, but fundamentally on target control, so good research is target shooting; in other words, accurate direction towards a valuable objective.

May I crystallise my remarks on research by saying that the only illuminant to burn in the Lamp of Research is the oil of good direction.

PRECISION

Having said a word on the thought that chemical enterprise must give to the future, we can turn to its problems of the present. As the world extends its knowledge and the scope of its endeavour, it becomes more exacting. The present century is growing into an age of the minute. In the cotton industry much of the development is towards finer counts; in the motor industry the tendency is for finer tolerances. In a recent motor catalogue I observe that more than 5000 operations are gauged to one thousandth part of an inch, and over 100 to a thirtieth of the thickness of a human hair. Catalytic reactions, of growing importance, are in the domain of the minute. That division between acidity and alkalinity which we used to call the neutral point has grown into a domain of p_H values. And these observations bring me to my second lamp—the "Lamp of Precision."

Chemical products are tending more and more to be sold, not for what they are, but for what they will do, and this naturally entails a uniform standard of performance. A dyestuff is sold not on its chemical composition, but because it will dye an almost definite weight of textile material to a desired shade, and with a defined degree of permanence to the factors, such as light, acids, alkalis, chlorine, heat, it will have to

withstand. An organic rubber accelerator—for example, diphenylguanidine—is sold not so much because it is this or that chemical substance, but because it will in a definite rubber mix effect a satisfactory cure at a definite temperature and within a defined period of time.

There are many other examples: insecticides, drugs, seed disinfectants, dispersing agents, wetting-out agents. Moreover, all these are concerned with what I might term the chemistry of the relatively small effect, in that the result produced is out of proportion to the quantity employed. "Stainless" steel is an example of what I call the small effect, and if chemical enterprise is to be equal to its task it must keep well trimmed the Lamp of Precision. Fortunately, so long as this need for accuracy is recognised, the lamp is to our hand, for the practice of analysis is the oldest section of chemistry, but the analyst, if he is to help chemical enterprise on its future path, must give even finer methods of precision, and of enlarged scope and technique. He must give us precise methods for evaluating effects rather than methods for determining composition. Chemical enterprise still has to carry on with methods almost by their nature incapable of fine and exact mathematical expression. The only way to test and standardise insulin is to keep an army of rabbits: the only way to test dyestuffs is to dye them on the fabric for which they are intended. The Lamp of Precision must, by its light, drive away all empiricism.

As I mentioned earlier, the chemical enterprise, particularly the organic chemical enterprise, is more and more selling an effect rather than a substance, and as a natural consequence of this the problems of the general customer are becoming those of the chemical industry itself. We see this in all sorts of ways: the development of acetate silk had to synchronise with the development of new dyestuffs, and new dyeing methods; the development of pyroxylin paints hinged upon the development of suitable methods of application.

It may be possible that this question of application of chemical products is a fundamental principle of all chemical enterprise. Perhaps synthetic petrol will not only abundantly assist natural supplies, but ultimately revolutionise the petrol engine by reason of some new and unknown property, which initially is merely a problem to be solved before successful use is assured. Some of the greatest drawbacks to the use of chemical products have turned subsequently to be amongst the greatest virtues.

As a general proposition, it is easier to discover a new product for a specific use than invent a use for a new product. I mention this in passing, as there have been occasions when the service which pure research has expected from chemical enterprise has been the discovery of uses for new products whose sole claim has been their novelty. Now, because the effect of a product is becoming more important than the product itself, it is essential that chemical enterprise shall have another lamp to guide its path, and that is the "Lamp of Service."

SERVICE

The importance of this Lamp of Service was perhaps early realised. Let me quote to you what

Sir W. H. Perkin said on this subject so long ago as 1896:—

"Before aniline purple could be introduced for dyeing woollen and mixed fabrics, weeks were spent at Bradford in finding out suitable methods of applying it. Not only had the difficulties welded to its manufacture to be grappled with and the prejudices of the customer overcome, but a large amount of time had to be devoted to the study of its applications."

This type of service was probably first developed logically by the great German dyestuffs firms, but it has had a prominent place in the development of the British dyestuffs industry. It is not, however, something peculiar to the dyestuffs business, but a fundamental part of the function which chemical enterprise must play in any country. No one who has been in the United States recently, and seen what they are doing in this direction, will deny the importance of the Lamp of Service.

On this question of service, there should, however, perhaps be sounded a note of warning. It is fatally easy to exaggerate what a substance will do. Some of the old advertisements of patent medicines, I think, sufficiently illustrate this point. Chemical enterprise in its service must beware of what it claims to do. The patient justification of results is better infinitely than wholesale claims. The Lamp of Service must burn brilliantly, but only by reason of the wick of honesty.

UNITY

And now we come to a very important lamp, which I have called, for want of a better designation, the "Lamp of Unity."

Chemical enterprise cannot be good in parts—it survives only by reason of the strength and well-being of the whole; and this can only be measured in terms of the financial and commercial health of its manufacturing ability. The heart and kernel of successful chemical enterprise is efficient manufacturing operation, and this is only possible under the rays of the Lamp of Unity. Precision; organisation (a word with a bad past but, properly understood, having a glorious present); chemistry; engineering; physics—all are necessary; but it is only the blend and unity of these in equivalent excellence that can ensure successful manufacturing operations. One observes that in any critical survey of British chemical enterprise this important item seems never to have been discussed at all; and although there have been addresses which, if not pointing the finger of example to Germany, have directed it towards the United States, it has apparently escaped observation that in the United States the problem of manufacturing operations has been appreciated at its proper value and in many directions realised its greatest achievements. This is not due to any national characteristic, but because American industrial enterprise as a whole is finally convinced of the urgent necessity for this Lamp of Unity.

Organic chemical manufacture is to-day intrinsically more difficult than ever; greater complication exists (think of the number of dyestuffs which to-day are manufactured and sold—surely, by the way, far too many); greater degrees of precision and purity, more sensitive control, are required than ever before.

The days when a new product could be sold at a price which would both allow a rich reward for the inventor and a high cost of manufacture have departed. The world has opened up so much, and means of transport become so extensive and so flexible, that nearly everything, both new and old, is competitive.

Users of dyestuffs perhaps forget that magenta started its commercial career at a price of about 3s. an oz.; but there is to-day no dyestuff, however valuable its possible particular properties, to be discovered that could survive such a price. Acetate silk and viscose compete in a general way with silk and cotton; synthetic resins with natural gums; whatever is, has its value and its new possibilities; but whatever its properties and its virtues, it must still come within the ambit of price presented by products of analogous utility.

All this inevitably means that the initial manufacture of any product must be more fully examined and perfected before any manufacture can begin. Often in the past chemical manufacture grew up and solved its problems as it grew; to-day, and even more in the future, chemical manufacture must start grown up at the beginning. Perhaps an illustration may make this point clear. No theatrical producer opens his first night until everything—play, stage, players, scenery—is absolutely first class: it entails patient design, discussion, training, team work and secret anxiety, but these he must face simply because he cannot afford to start an undertaking prejudiced against its success. Manufacture to-day is almost a science; and there is a vast difference between manufacturing a product and making it on the large scale.

Many reasons have been advanced at different times by various eminent gentlemen to account for the fact that Great Britain lost so quickly the initial lead in the synthetic dyestuffs industry; but it is interesting to note that, although for the period 1869–1871 the production of alizarine in Great Britain was greater than elsewhere, within the narrow space of two years it had fallen to one third. Such reasons as Patent laws, restrictions on the use of alcohol, lack of research work, are insufficient properly to account for such a sudden and drastic change. Meldola, speaking in 1908, said: "By that time (1873) it was fully realised that a complete revision of the plant had become necessary. It required enlarging and modifying." I think you will find that the reason for the first stages of the decline was that the Lamp of Unity had grown dim.

Sir W. H. Perkin himself, speaking of the question of manufacture, recalls the "number of matters which were apparently of small importance, but it is remarkable the amount of difficulty and annoyance they caused."

The spirit to burn in the Lamp of Unity, and there can be no other, is the spirit of thrift. Thrift means to the chemical manufacturer the highest standard of performance for everything. It means the highest yields; the best process; and the best use, therefore, of labour, time, material, and money. It is the chemical definition of the word "immaculate."

Chemical enterprise with this Lamp of Unity need fear no competition and no comparisons.

JUDGMENT

There is another lamp of chemical enterprise, and that is the "Lamp of Judgment." If this quality is not most important of all, it is, perhaps, most difficult to find. The faculty of judgment can be fostered, but it cannot be created. Research may provide the information, manufacturing operations may have their unity and thrift, service may be all that we desire, but it is the Lamp of Judgment which must illuminate the whole area of chemical enterprise.

The "when" and the "where" are in any enterprise of great importance: the time, the place, the material. All sorts of factors have to be taken into account: questions of transport, availability of materials, proximity of markets; but even with the guidance derived from these factors, the ultimate decision will often rest upon impartial and clear judgment.

The problems which arise in chemical enterprise of to-day are so many-sided, and often such a seeming balance of pros and cons, that in the end, despite all the wonderful resources of chemical industry to-day, the decision can come only with a clear-eyed sense of judgment.

Possibly you may think I have stressed this point too much. Lord Rosebery said, speaking of the Premiership, "The most necessary quality is judgment." And it must be true of all places and positions where the L.C.M. of any problem is still subject to a host of uncanceled qualifications.

Chemical enterprise of the future will succeed best on a broad basis. There are, inevitably, so many cognate products to be made which can properly only exist contiguous to their respective principal manufactures. The synthetic production of methyl alcohol best exists adjacent to synthetic ammonia, and once you get the starting point, other manufactures inevitably follow.

There is no other course. You have a consideration which even to-day organic chemical industry has to face—the problem of where to stop. Chemical enterprise, if it is to be successful, is bound to become larger in scope, and the size of the industrial unit increase. I think there is nothing to be alarmed at in this, because it is going to be an asset, and the more synthetic we become in our methods the more will chemical endeavour be geographically concentrated, and the greater our dependence on the coalfields. This tendency of the enterprise in the very nature of things to become fundamentally large in its scope does bring, perhaps, some new problems in its train, in that chemical enterprise will tend to become a community; it will enlist in its service the chemist, the engineer, the physicist, the labourer, and the artisan. The psychology of this "group mind" will require patient study. You will have the imagination and ardour of the chemist; the constructive skill of the engineer; the detailed and logical mind of the physicist; the pride of the craftsman; the honest and ungrudging toil of the labourer.

The problem, therefore, of its government and its correlation will require tact; wisdom and fairness; and statesmanship equivalent to that necessary for the well-being of a country, and this reflection brings us to the "Lamp of Leadership."

LEADERSHIP

Much of the success of chemical enterprise in the future will depend on whether it is able sufficiently to command this quality.

Good leadership is not a solitary quality. It has been said, "An emperor who is his own council of ministers in peace, and his own general staff in war, is unlikely to leave behind him any considerable or coherent body of political theory." It is equally true that the industrial leader who does likewise is also unlikely to leave behind a prospering and continually developing enterprise. There is a tyranny of thought and action which in industry is in the long run as fatal as any political tyranny. The will to play the tyrant exists in every man: it is one of the deadly sins to which human nature is liable. Good leadership is not a tyranny: it means efficiency: personality; urbanity; the capacity for suspended judgment; idealism; and appreciation of value; team work; and the genius for doing the right thing because it is the right thing.

Good leadership will, therefore, create good leaders, and will surround itself with good leaders. It is the business of good leadership to be prepared for all eventualities, not as a result of the inspiration of the moment, but by the careful consideration of all the factors in advance of the eventuality.

Leadership must, as Lord Moulton remarked, "take the necessary time and reflection before we commit ourselves to any course of action. The delay of deliberation is far less than that of defeat."

Leadership means much: as I see it, it means the knack of inspiring a large body of different sorts of people with the same enthusiasm for the same objective; with creation of a constitutional form of government within the undertaking; with making every man, however insignificant, feel that he is an important link in the chain, or to change the metaphor, of being a king in his kingdom: it means the building up of an organisation which is not only capable of solving its own problems, but of providing its own training ground for its high positions. The industrial leader is surely not he who can brilliantly extricate it from the chaos into which it has drifted, so much as he who by careful staff work, and the considered solution of problems before they occur, can keep it from ever descending into chaos. It is true that the old method seems more brilliant, but the other way is the real way, and is more difficult since it does not depend upon erratic moments of inspiration.

VISION

Now we come to the "Lamp of Vision." Thus far my lamps have been mainly concerned with the well-being and stability of the enterprise, but it is of capital importance that in its vision it should be clear and definite as to its purpose and proper function in a modern world.

I think, in considering the point, we have to go back to fundamental things. Nature is, after all, the greatest chemist, and is, moreover, pre-eminently an organic chemist. In the inorganic field Nature has confined herself to relatively few materials, even a goodly number but still relatively few, whereas in the organic field we have natural dyestuffs, perfumes, coal, oil, textile fibres,

resins, drugs, tanning materials, leather, to say nothing of the complex structures of which the animal and vegetable kingdoms are comprised, and from which individual products are derived.

The ultimate proper function of chemical enterprise, I would say, is to improve upon Nature—a supremely difficult operation—particularly and mainly with respect to the time factor.

Civilisation has arrived at such a point of complication that it can no longer afford to wait for Nature. Nature acts in units of a year, a century, or a millenium, as the case may be, and the modern trend of chemical enterprise is to reduce this to units of days and weeks.

It is interesting to pause here to observe that, I think, the only section of organic chemistry which has almost completely surrendered to chemical enterprise is that of synthetic dyestuffs; but essential as they undoubtedly are, dyestuffs from the standpoint of ultimate national economies are amongst the least important of the objectives of organic chemical enterprise. Synthetic resins will surely have to make up for the inevitable shortage of natural resins and gums; artificial silks already enable cellulose, Nature's largest single production, to replace the patient and seasonal output of the silkworms. Synthetic methyl alcohol and synthetic acetic acid have already enabled us to dispense with the old wasteful destruction of cellulose. Synthetic petrol, of which perhaps we are to-day but treading on the threshold, represents possibly the most striking and far-reaching of the results of vision in chemical enterprise.

Our task in the future is still further to supplement the armoury of the agriculturist against the less benevolent of Nature's activities: by chemical sprays and washes it must resist the attacks of insect pests on both the growing plant and its seed. Fermentation processes must more and more be enlisted in the service of chemical enterprise. Synthetic rubber, at one time much heralded, will eventually arrive. And one day chemical enterprise must address itself still further to the ultimate problem of all, the problem of food supply. Synthetic fertilisers have done much, and will do more, but is it certain—I ask the question—is it certain that it is beyond the ultimate grasp of chemical enterprise to furnish that "something," whatever it be, which will eventually and surely cut down the period of time necessary for plant and vegetable growth, and thus make harvests so abundant that succeeding generations may straighten shoulders no longer burdened as are ours? Than this, chemical enterprise, in its vision, can have no better horizon.

CANADIAN MINING AND METALLURGY

A Montreal syndicate has leased the antimony mines at Lake George, York Co., New Brunswick, from the North American Antimony Smelting Co., and will resume operating the mine at once. The same syndicate is negotiating for the purchase of the Malagash salt mine, Malagash, Nova Scotia, and is also considering the development of the large salt deposit near Dover, Westmoreland Co., New Brunswick. It is understood that the syndicate has in view the erection of large chemical works in the Maritime Provinces.

THE FIRST MEETING OF THE INSTITUTE OF CHEMISTRY OF THE AMERICAN CHEMICAL SOCIETY

For six years past there has been held at Williamstown, Mass., an Institute of Politics that has aroused widespread interest. The organisers of this annual conference have shown considerable enterprise in arranging discussions on aspects of political science that are seldom publicly debated. In no way could this be illustrated better than by the fact of their devoting part of last year's session to a round-table discussion of the relation of chemistry to world affairs.

A number of prominent chemists, including Principal Sir James Irvine, were present, and so much were they impressed with the value of the discussion that the idea arose of founding an Institute of Chemistry organised on somewhat the same plan as the Institute of Politics, and devoted to extending the basis of co-operation between chemical science and industry, and to widening the interest of the man in the street in advances in these fields of knowledge.

Convinced of the potential value of an annual conference of this character, the initiators—Dr. H. E. Howe (editor of the *Journal of Industrial and Engineering Chemistry*), Dr. Gerald Wendt (Dean of Chemistry, State College, Pa.), and Dr. Whitmore (Professor of Chemistry, North Western University, Ill.)—supported by many prominent industrialists, threw themselves heart and soul into the scheme, and, in spite of the fact that the decision was reached at a date so late that it seemed an impossibility for a meeting to be organised for 1927, all obstacles were swept aside by the enthusiasm and incessant labour of these men and of the Executive secretary, Dr. A. W. Keimsey, of the Du Pont de Nemours Company.

No praise can be too high for the manner in which the meeting, held this year in State College, Pa., during the month of July, was organised. It impressed the writers as one of the most efficiently conducted and valuable chemical conferences in their experience. The choice of State College as the centre of activities of the first Institute was commendable, for it enabled the delegates from all parts of the States to escape the terrors of an American city in the hot weather and to have at one's doors plenty of opportunity of recreation in leisure moments.

The State University, around which revolves the life of the small town of State College, is beautifully situated at the foot of one of the fertile valleys separating the steep, razor-back ranges of the Alleghenies. The University buildings (the photograph shows the uncompleted Chemistry building) lie scattered round a beautiful campus of sweeping lawns and shady avenues, whilst for many miles in every direction stretches some of the finest country in Pennsylvania.

The main features of the Institute were the morning conferences at 11 and the evening lectures at 8. At the former a general paper was read on some problem of modern interest and was followed by a discussion, whilst the latter were devoted to reviews of a more popular nature.

In addition to these arrangements, there were a number

of courses organised in connexion with the Summer school at the University, which could be attended by students or by delegates who desired a "refresher" in any particular direction.

A typical day at the Institute would open with attendance at a lecture of one of the many courses at 8.30 or 9.30. Then practically every one would assemble in the large theatre, known locally as "the Bull-pen," at 11, for the morning lecture and discussion, after which there would be dispersal to Fraternity House or elsewhere for lunch.

The afternoons were kept free for recreation, and abundant facilities were available. Tennis courts were reserved on the University campus for the use of the delegates, and both men's and women's tournaments were organised. Other delegates would motor to Bellefont for bathing, to the University lounge or the country club for golf, or into the surrounding country to see its beauties. Apart from the wonderful scenery in the mountains, this part of Pennsylvania is of great interest in that the fertile valleys running between the ranges of the Alleghenies are to a large extent populated by what are known as the Pennsylvania Dutch. Descended from German settlers of the early eighteenth century, these hard-working simple farmers have retained the speech (Plattdeutsch), customs and religion of their fathers, and spend their primitive existences almost undisturbed by the whirl of modern American life all round them. Within a few miles of the roaring high road between Philadelphia and Pittsburgh one can come across communities of the strict sect of these people known as the Mennonites, both men and women of which do not cut their hair, and wear the plainest garments of dark grey cloth devoid of even so innocent a decoration as a button, in accordance with what they regard as the authority of the Bible. These parts are not only a stronghold of fundamentalism, but are rich in old German folk-lore and custom.

At 6.30 every evening, after an early dinner, it was possible to visit the local cinema and see series of films dealing with many aspects of chemical industry, after which at 8 came one of the semi-popular lectures in the "Bull-pen." The end of this lecture did not, however, close the day, but actually opened what proved to be one of the most enjoyable and profitable periods, namely, the hour or two when all the delegates foregathered, at one of the Fraternity Houses, for a chat and quiet rubber of bridge or an informal dance.

Many a friendship was made, and many a problem was thrashed out for better or worse at these pleasant informal evening gatherings.

Amongst the many excursions organised by the Committee the most interesting was to the home of Priestley at Northumberland on the Susquehanna River. The old house, situated in a pleasant garden sloping down to the river, stood much as it must have appeared in Priestley's time, except that neglect had caused it to fall into a very dilapidated condition. Fortunately, it was saved from the housebreakers' hands a few years ago by the efforts of the late Dr. Pond, then Dean of Chemistry at State College, Pa., and is now being restored and preserved by the American Chemical Society. The house in its present condition is shown

in the accompanying photograph, which does not, however, show the small museum that has been built in chemistry. Perhaps the success of the meeting was in greatest measure due to the arrangement by which

Dr. G. W. Kenney, Exec. Sec. Dr. F. C. Whitmore, Assoc. Director Dr. H. E. Howe, Editor, "Ind. and Eng. Chem." Dr. C. L. Parsons, Sec. A. C. S. Dr. G. Wendt, Director

A group of Organisers, State College, 1927

in the grounds to accommodate a valuable collection of Priestley's books, letters, and apparatus.

In every respect the Conference was a great success.

several days were devoted to the discussion of one or several closely-related subjects, which followed one another in a carefully-thought-out sequence. Thus

Part of the Uncompleted Block of Chemistry Buildings. State College, Pa.

The attendance was good, averaging from 200 to 250 each week, and representative of every branch of chemistry for four days the conferences and evening lectures dealt with theories of catalysis, surface films, catalytic

syntheses, ammonia synthesis, and oxidation and high-pressure synthesis, thereby enabling chemists who could

greater than the most optimistic member of the Committee had hoped to attain.

A group of Lecturers at the Institute of Chemistry, State College, 1927

not afford the time to attend the Institute for the whole period to be present for those days during which they would be sure to find a large proportion of the other

Already plans are being made for next year's meeting which, it is understood, will be held at the North Western University, Evanston, Ill., and the writers can wish

The House of Priestly, Northumberland, Pa.

scientists present sharing their interests and a programme presenting particular attractions.

The American Chemical Society is to be congratulated on the success of its new venture, which must have been

it no greater success than that which attended the first meeting, nor wish those delegates who will be there a more delightful experience than they themselves had at State College.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

LIST OF MEMBERS ELECTED

October 14, 1927

- Angus, Harold T., Brooklands, 331, Station Road, Yardley, Birmingham. Chief Chemist.
- Appleyard, Kenelm C., Birtley Springs House, Birtley, Co. Durham. Engineer.
- Archer, David C., "Gracemere," Haig Street, Maroubra, Sydney, N.S.W. Assistant Chemist.
- Arrowsmith, John C., The Pressed Steel Co. of Great Britain, Ltd., Cowley, Oxon. Metallurgist.
- Baldwin, Robert T., 52, East 41st Street, New York, N.Y., U.S.A. Secretary.
- Bartow, Edward, University of Iowa, Iowa City, Iowa, U.S.A. Professor of Chemistry.
- Bicknell, Richard S., 21, Bergen Place, Red Bank, New Jersey, U.S.A. Engineer.
- Blackater, John C. jun., 2, Crown Terrace, Dowanhill, Glasgow, W.2. Analyst.
- Bowyer, Cyril H., 73, Sternhold Avenue, Streatham Hill, Brixton, London, S.W.2. Assistant Chemist.
- Brabrook, George H., Tennis and Racquet Club, 939, Boylston Street, Boston, Mass., U.S.A. Mines and Mining.
- Bradshaw, Francis L., 83, Crane Avenue, Isleworth, Middlesex, Commercial Traveller.
- Bramson, Mogens L., Abbey House, 2-8, Victoria Street, London, S.W.1. Consulting Engineer.
- Brentnall, A. S., Betteshanger Colliery, Northbourne, Eastry, Kent. Chemist.
- Campbell, Robert C., c/o Rickett Smith & Co., 52, Mark Lane, London, E.C. Coal Salesman.
- Carothers, John N., Federal Phosphorus Co., Anniston, Ala., U.S.A. Vice-President.
- Carter, George H., "Greenholme," 31, Horsforth Avenue, Bridlington, Yorks. Metallurgical Chemist.
- Dodds, George P., c/o Isaac Spencer & Co., Ltd., Albert Quay, Aberdeen, Scotland. Factory Manager.
- Donald, Maxwell B., Oficina Celia, Estacion Salinas, Pampa Central, Antofagasta, Chile, S.A. Chemical Engineer.
- Drummond, Walter J., Ashington Colliery, Ashington, Northumberland. Engineer.
- Dunworth, James F., 9, Boston Avenue, Currock, Carlisle, Works Chemist.
- Durnford, Norman S. M., c/o James Durnford & Son, Ltd., Wapping Wharf, Bristol. Managing Director.
- Edwards, John, 8, The Grange, Westbury-on-Trym, Bristol. Technical Chemist.
- Evans, J. M., c/o Associated Oil Co., Associated, California, U.S.A. Chemist.
- Garçon, Jules, 82, rue Taitbout, Paris, IXe, France. Engineering Chemist.
- Garner, William E., Chemical Department, The University, Bristol. Professor of Chemistry.
- Golodetz, Nathan, 117A, Fenchurch Street, London, E.C.3. Director of Companies.
- Green, George C., 469, Belchers Lane, Little Bromwich, Birmingham. Analytical Chemist.
- Honeysberg, Herman F., c/o Apartado No. 318, Bogota, Rep. of Colombia, S. America. App. Chemist.
- Hopkinson, Percy, 28, Rhodesia Road, Chesterfield. Industrial Furnace Engineer.
- Hunter, Miss Elizabeth, PX Laboratory, Parlin, New Jersey, U.S.A. Chem. Librarian.
- Kenney, Frederick J., P.O. Box 225, Hewlett, Long Island, New York, U.S.A. Chemist.
- Landon, Nathaniel R., Delaware, Lackawanna & Western Coal Co., 120, Broadway, New York, U.S.A.
- Liebovitz, Dr. Sidney, Bolinross Chemical Co., 12-22, Orange Street, Newark, N.J., U.S.A. Chemist.
- Macdonell, Colin C., 514, Essex Avenue, Narberth, Pa., U.S.A. Chemist.
- McLusky, John W., City Chambers, 30, John Street, Glasgow, C.1. Gas Engineer.
- Mahler, Paul, 50, East 41st Street, New York City, U.S.A. Consulting Chemist.
- Meredith, David O., Electrolytic Zinc Co. of Australasia, Ltd., P.O. Box AA B, Hobart, Tasmania. General Superintendent.
- Mundy, Cecil W. A., "Lyndhurst," London Road, Ewell, Surrey. Oil Technologist.
- Norman, George M., c/o Hercules Powder Co., Wilmington, Delaware, U.S.A. Technical Director.
- Odams, Ronald C., Stanford House, Stanford-le-Hope, Essex, Chemist.
- Palmer, Charles S., Chemical Laboratory, Northwestern University, Evanston, Ill., U.S.A. Assistant Professor of Chemistry.
- Reece, William H., Leyland & Birmingham Rubber Co., Ltd., Leyland, near Preston, Lancs. Chemist.
- Sohn, Erwin, c/o Standard Sanitary Mfg. Co., 2801, Preble Avenue, Pittsburgh, Pa., U.S.A. Director of Research.
- Tower, Dr. Olin F., Western Reserve University, Cleveland, Ohio, U.S.A. Professor of Chemistry.
- Wheeler, Albert W. E., 98, Clements Road, East Ham, London, E.6. Works Chemist.
- Wilson, Ellery L., c/o Rumford Chemical Works, Rumford, R.I., U.S.A. Vice-President and General Superintendent.

NOTTINGHAM SECTION

The meetings of the Nottingham Section of the Society commenced on October 19 with an address by John Allan, F.R.S., on "Soaps in the textile industry." On November 9 the subject will be "The action of chlorine and hypochlorous acid on wool," by S. R. Trotman, M.A., and E. R. Trotman, Ph.D. The final meeting of the year will be held on December 7, when Prof. R. Robinson, D.Sc., F.R.S., will speak on "The indole group of the alkaloids." In the New Year a meeting will be held on January 11 or 12, when S. R. Trotman and E. R. Trotman will present a paper on "The action of acids on wool."

CALENDAR OF FORTHCOMING EVENTS

Oct. 24.—Institution of Electrical Engineers. Informal Meeting.

Oct. 24.—Institution of Mechanical Engineers, *Graduates' Section*. Storey's Gate, Westminster, S.W.1, at 6.30 p.m. "The liquefaction of air," by J. Rogers.

Oct. 27.—Society of Chemical Industry and Institute of Chemistry, *Edinburgh and East of Scotland Sections*. Joint Meeting. The North British Station Hotel, Edinburgh, at 7.30 p.m. Inaugural address by J. Adam Watson.

Oct. 27.—Coke Oven Managers' Association. Annual General Meeting at the Hotel Great Central, London, at 2.30 p.m., when Mr. G. A. Hebden will deliver his Presidential address. At 6.30 p.m. the Annual Dinner will be held.

Oct. 27.—Institute of Brewing, *North of England Section*. Midland Hotel, Manchester. "The determination of anti-septic power, with special reference to hops," by Dr. T. K. Walker.

Oct. 27.—Institution of Mining and Metallurgy. *General Meeting*. Burlington House, Piccadilly, W.1, at 5.30 p.m.

Oct. 27.—Institute of Brewing, Midland Counties Section, White Horse Hotel, Congreve Street, Birmingham. "Brewer's microscope—a demonstration of its selection and use, with some hints on photomicrography," by H. Lloyd Hind.

Oct. 27.—Institution of the Rubber Industry, Manchester and District Section, Geographical Society, St. Mary's Parsonage, Manchester. "Transmission and conveyor belting," by W. A. M. Keith.

Oct. 28.—Institution of Mechanical Engineers. Informal Meeting.

Oct. 28.—Manchester Literary and Philosophical Society. Chemical Section Meeting.

Oct. 28.—West Cumberland Society of Chemists and Engineers, at 7 p.m. "Use of explosives in mining and quarrying," by J. E. Lambert.

Oct. 28.—Coke Oven Managers' Association. Visit to H.M. Fuel Research Station, East Greenwich, by the courtesy Dr. C. H. Lander.

Oct. 28.—The Physical Society, Imperial College of Science and Technology, Imperial Institute Road, South Kensington, S.W.7, at 5 p.m.

Oct. 28. Institution of Chemical Engineers, at the Institution of Civil Engineers, Great George Street, Westminster, S.W.1, at 6.30 p.m. Public Lecture by Sir William Bragg, K.B.E., F.R.S., on "Crystallisation."

Oct. 28.—Society of Chemical Industry, Liverpool Section. The University, Liverpool, at 6 p.m. "Merseyside and chemical industries," by Dr. A. Holt.

Oct. 28.—University of London, University College, Gower Street, W.C.1, at 5.15 p.m. "Symbiosis, parasitism and immunity in plants," by Prof. B. Nemes.

Oct. 31. Society of Chemical Industry, Yorkshire Section. Joint meeting with the Institute of Chemistry, Leeds Area Section. The University, Leeds, at 7.15 p.m. "Flame," by O. C. de C. Ellis.

Nov. 1.—Royal Institution of Great Britain, 21, Albermarle Street, W.1, at 5.15 p.m. "Light and sight," by Sir J. H. Parsons.

Nov. 1.—Institute of Metals, North-East Coast Local Section. Armstrong College, Newcastle-on-Tyne, at 7.30 p.m. "Mechanical properties of metals at high temperatures," by G. Burns.

Nov. 1.—Institution of Civil Engineers, Ordinary Meeting. Great George Street, Westminster, S.W.1, at 6 p.m.

Nov. 2.—Institution of Sanitary Engineers. Annual Dinner.

Nov. 2.—Society of Public Analysts, Ordinary Meeting. St Mary's Hospital, W.2 at 8 p.m.

Nov. 3.—Chemical Society, Ordinary Scientific Meeting. Burlington House, Piccadilly, W.1, at 8 p.m.

Nov. 3.—Institution of Electrical Engineers, Ordinary Meeting. Savoy Place, Victoria Embankment, London, W.C.2, at 6 p.m. "Higher steam pressures and their application to the steam turbine," by A. H. Law and J. P. Chittenden.

Nov. 3.—Society of Dyers and Colourists, West Riding Section. "The synthesis of sugars from carbonic acid by means of light," by Prof. E. C. C. Baly.

Nov. 3.—Society of Chemical Industry, Bristol Section. The University, Woodland Road, Bristol, at 7.30 p.m. "The manufacture of viscose artificial silk," by H. H. S. Clotworthy.

Nov. 4.—Institution of Mechanical Engineers, Thomas Hawksley Lecture. Storey's Gate, St. James's Park, S.W.1, at 6 p.m. "Application of X-rays to the study of the crystalline structure of materials," by Sir W. H. Bragg.

OBITUARY

Dr. R. GREIG-SMITH

It is with great regret that we have to announce the death of Dr. Robert Greig-Smith, D.Sc., a member of the Society of Chemical Industry since 1890, and the chairman of the Sydney Section of the Society from 1906 to 1908. He was joint secretary with Mr. R. H. Cambage of the Royal Society and Macleay bacteriologist to the Linnean Society of New South Wales, and published numerous papers connected with his researches in general, economic, and pathological bacteriology. He was born in Edinburgh in 1866, and educated at George Watson's College and later at the Edinburgh University, where he won the medal in chemistry, the special prize in senior botany, and first-class honours and prizes in other subjects. In 1891 he was appointed lecturer in agricultural chemistry in the University of Durham College of Science, and was additional examiner in agricultural chemistry in the University of Edinburgh and additional examiner in chemistry and physics to the Highland and Agricultural Society of Scotland. In 1890 he took the degree of B.Sc., and graduated D.Sc. of Edinburgh in 1903 with a thesis on certain fermentations of saccharose. He was also awarded the M.Sc. of Durham. He was a great student and a man of sterling worth, who will be greatly missed.

CORRESPONDENCE

UTILISING A BROKEN BURETTE

SIR, —With further reference to my letter in your issue of September 30, under this heading, Mr. V. Stott, of the National Physical Laboratory, through the courtesy of the Director, has kindly pointed out to me the importance of making the orifice of the inserted jet of such size as to give the burette the same delivery time after repair as it had before breakage.

At the time I wrote the letter, I fear that I had uppermost in mind the value of the little gadget to the student who has had the misfortune to break his burette tap, and to the institution whose annual grant is strictly limited in amount.

I should be glad if you would publish this in order that the value of Mr. Stott's recommendation is not lost.

I am, Sir, etc.

Technical College, Huddersfield

A. O. JONES

PERSONAL AND OTHER ITEMS

The Rt. Hon. Viscount Cave, G.C.M.G., Lord Chancellor of England and Chancellor of the University of Oxford, will open the new School of Biochemistry at Oxford on October 21.

Sir Alfred Mond and Sir Robert Hadfield were among the speakers at a meeting held last Monday at the Mansion House, under the presidency of the Lord Mayor of London, with the object of exploring the possibility of establishing peace in industry (cf. p. 950).

Lieut.-Col. E. T. Lea has been elected Prime Warden and Mr. E. P. T. Elyard as Reuter Warden of the Dyers' Company.

According to the *Evening News*, Sir John Brunner has resigned from the board of Imperial Chemical Industries, Ltd.

We are glad to announce that Mr. J. W. Woolcock, B.A., the son of Mr. W. J. U. Woolcock, C.B.E., Past-President of the Society of Chemical Industry, has been elected to a war memorial studentship in chemistry at Balliol College, Oxford. Mr. Woolcock, junr., who was formerly at St. Paul's School, and recently a Williams exhibitor in National Science of Balliol College, obtained a first class in the final school of natural science (chemistry) last June.

Prof. E. Cohen, director of the Van't Hoff Laboratory of the University of Utrecht, has celebrated the completion of 25 years' occupancy of his chair in the University. Prof. Cohen, who is a well-known figure at chemical gatherings in England and abroad, will receive the heartiest congratulations from all chemists.

Mr. E. George Eddy has consented to accept nomination as Mayor of Kidderminster for the ensuing year. He is managing director of Messrs. B. Hepworth & Co., chemical manufacturers, of Kidderminster, and Cleckheaton, Yorks.

Mr. W. Cartwright has been appointed assistant lecturer in metallurgy and Mr. C. Chew has been appointed demonstrator in chemical technology in the University of Manchester.

Prof. J. A. Prescott, professor of agricultural chemistry in the Waite Institute, University of Adelaide, has been appointed adviser on soil problems to the Commonwealth Council for Scientific and Industrial Research.

At Emmanuel College, Cambridge, the research studentship in biochemistry held by C. Rimington, B.A., has been continued, and a grant from the Research Fund has been made to C. B. Allsopp, B.A., for research in physical chemistry.

The Institution of Civil Engineers has awarded the Howard Quinquennial Prize to Prof. W. E. Dalby, in recognition of his researches on the strength and structure of iron and steel.

The late Mr. W. Stubbs, J.P., a retired manager of salt works belonging to the Salt Union, Ltd., left £5276.

The following deaths are announced from Germany:—G. Eichler, formerly director of the German Potash Syndicate; Dr.-Ing. E. Ichenhaeuser, a deputy director of the I.G. Farbenindustrie A.-G.; L. Rosney, a well-known petroleum expert; Dr. J. Ephraim, a well-known chemist and patent expert; Prof. E. Lawes, of Hannover; Dr. H. Gebhard and Dr. Weber, chemists at the Offenbach works of the I.G. Farbenindustrie A.-G., as the result of an accident.

Sources of Vitamins A and D

In *Nature* (October 8), Mr. P. W. Tainsh, of the Port Sunlight Research Laboratories, referring to a previous letter by Messrs. Rosenheim and Webster (*Nature*, September 24, noted in CHEMISTRY AND INDUSTRY, October 7, p. 912), states that a large-scale method has been developed in those laboratories of obtaining from cod-liver oil a palatable extract containing vitamins A

and D in highly concentrated form, and it has been found possible to incorporate this concentrate in margarine without loss of vitamin efficiency, as has been shown by colorimetric and biological tests. Margarine containing uniform quantities of both vitamins of the same order as those found in butter could now be purchased.

Mr. C. A. Hill, of the British Drug Houses, Ltd., writes (*Nature*, October 15) to say that ergosterol is now available commercially, as it and the irradiated product are made on a large scale by the British Drug Houses, Ltd. It is already on the market in a popular form for public use: it is available for margarine manufacturers to bring their product up to the standard of summer butter, which they can do at a fractional increase in cost; and chocolate manufacturers are already experimenting with it.

The Chemist at the Motor Show

If proof were needed, Olympia this year shows whether cellulose products are replacing oil paint in the motor-car trade or not. Of the 630 odd cars on show, 120 are finished in cellulose paint, 146 in the Weyman type fabric, and the remainder fall to the older type of oil paint. Last year 56 cars were finished by the cellulose process, and one or two French cars had fabric bodies. The previous year cellulose made its first appearance in this country. Is this not progress, and one of which the chemist may justly be proud?

Cellulose paints find themselves now not without a new competitor in the form of the fabric-covered body. This is made up to resemble leather, and in the majority of cases consists of a nitrocellulose base. Some fabrics are definitely stated to be "cellulose leather fabric," whilst others are marketed under the trade names of Rexine, Ceymal, Fabrikoid and Autohyde.

Are there remaining any of the old-established oil and paint manufacturers still too sceptical to be interested in cellulose lacquers and enamels?—H.S.G.

Metallurgical Photomicrographic Apparatus

From *Nature* it is learned that several orders for metallurgical photomicrographic apparatus have recently been placed abroad. To meet this unsatisfactory position Sir Robert Hadfield, Bart., F.R.S., announces that as his firm, Messrs. Hadfields, Ltd., desires to purchase an up-to-date outfit for metallurgical photomicrography, he or his firm is prepared to pay a premium of £50 over the price of the foreign apparatus for a British-made equipment which fulfils metallurgical requirements as well as does the foreign product.

Faraday Society's "Transactions"

In future the *Transactions* of the Faraday Society will be published in twelve monthly parts. Where the reports of general discussions extend over more than one part, two or more parts may be published simultaneously. The membership subscription remains unchanged, and the *Transactions* will still be available to non-members in the form of volumes or of parts.

Chemical Warfare

The International Red Cross Committee of Geneva has decided to call an international meeting of experts to study how to protect civilians against the effects of chemical warfare. The meeting will be held in Brussels on January 16, 1928.

High-pressure Boilers

There is every probability that very high steam pressures will come into use in the chemical industry. Already a 4000 sq. ft. cross-drum type of boiler, working at 1000 lb. pressure, has been installed at a Missouri sawmill to provide high-pressure steam for the conversion of waste into fibreboard, and other high-pressure boilers for chemical works are said to be under consideration.

British Standard Paints

The British Engineering Standards Association has recently issued British standard specifications (Nos. 293, 294, 295, 297, 298, and 299 of 1927) for ready mixed linseed oil paint (oil gloss), green, black and red oxide of iron, lithopone oil paste for paints, red oxide of iron oil paste (class 1, natural or mixed oxides, and class 2, oxide of iron base) for paints. They contain clauses regulating the composition, together with standard reception tests, for the purchase of these materials, together with appendices giving methods of carrying out the tests.

Copies of these six new specifications (Nos. 293, 295, 297, 299, 1927) can be obtained from the British Engineering Standards Association (Publications Department), 28, Victoria Street, London, S.W.1, or from the publishers, Messrs. Crosby Lockwood and Sons, 7, Stationers' Hall Court, London, E.C.2, price 2s. 2d. each, post free.

Standard for Ice Cream

A deputation representing the Ice Cream Association of Great Britain and Ireland has submitted various recommendations for the control of the manufacture and distribution of ice cream to the Ministry of Health. The chief recommendations are that ice cream should be legally defined as a frozen product containing not less than 8% milk fat and not less than 10% milk solids not fat, and that its preparation and distribution should be controlled in a manner similar to milk.

Cinchona Alkaloids for Moth-proofing Fabrics

L. E. Jackson and H. E. Wassell (Ind. & Eng. Chem., October, 1927), in the course of an investigation of possible moth-repelling chemicals, have found that the cinchona alkaloids and their derivatives are particularly effective moth repellants (U.S.P. 1,615,843 of 1927). One of the cinchona alkaloids has been in successful commercial use for over a year in the dry-cleaning and dyeing industry, and the process promises to be applicable in a wide range of uses, particularly as a variety of solvents can be employed. Application (by spraying or immersion) is easy and economical, and the treatment does not show on or affect the properties of textiles.

Collapse of Ontario Nickel Mine

With reference to the collapse (cf. CHEM. & IND., October 7, p. 913) of the Worthington Mine in Ontario, one of the properties of the Mond Nickel Company, the directors of the company, in a statement issued to the Press, report that as the mine was the smallest and one of the company's oldest, the closing of it will in no way jeopardise the company's supplies of ore, nor affect their production of nickel.

Lignite Distillation in New Zealand

A company, Carbonite, Ltd., has been formed in Auckland to work the Debauche process for distilling lignite.

A test was recently made in Belgium during a week, on 75 tons of Waikato (New Zealand), and 11 cwt. of residual fuel per ton of coal was obtained. The yield of heavy oil was 10 galls., and of motor spirit 2 galls., though 11½ galls. and 2½ galls., respectively are expected to be obtained in commercial working. The fuel obtained after screening yielded a nut coal suitable for marine and industrial use, and fines which were briquetted. Both nut coal and briquettes gave excellent results in use.

Low-temperature Carbonisation in Chile

In 1926 a committee was appointed to consider the possibility, technical and commercial, of producing oil by the low-temperature carbonisation of Chilean coal. As a result of the recommendations of the committee, a bill has been drafted to provide for a Government guarantee for 10 years for a plant producing not less than 15 tons of oil daily, limited to Chilean coal owners able to ensure adequate supplies of coal. No action has yet been taken on this bill.

State Control of the Chilean Iodine Industry

According to the journal "Caliche," the iodine industry in Chile is to become a State monopoly. The distribution of orders among the producers, the method of production, and the price are all to be controlled by the State.

The I.G. Farbenindustrie

The synthetic motor fuel produced by the I.G. Farbenindustrie at its Leuna works was used by the winner of two races at a meeting held by the German Automobile Club on October 17.

A report of the recent meeting of the board of the I.G. Farbenindustrie states that production and output during the past year have increased, and business in all departments, including that of synthetic petrol, is excellent. The conclusion of negotiations between the I.G. Farbenindustrie and the Norwegian Hydro-Elektrisk Kvaelstov concern was announced.

It appears that the Norwegian company, which, it is stated, can supply electric power for the synthesis of nitrogen products more cheaply than any other similar firm outside Germany, is to treble its production of synthetic nitrogen products; the company is negotiating a loan of over \$20,000,000 in New York. The agreement with the I.G. provides for co-operation of the technical and sales departments of the two concerns and for the exchange of shares. The report also states that the use by the I.G. of brown coal instead of Ruhr coal for nitrogen fixation has appreciably reduced manufacturing costs.

Two employees of the I.G. Farbenindustrie have been poisoned at the trust's Offenbach-am-Main factory, owing to an escape of phosgene gas. The I.G. announces that the phosgene escaped from a leaky cylinder, and that the manufacture of phosgene was authorised by the Inter-Allied Military Commission of Control because it was needed for the production of dyestuffs. According to *The Times*, however, it has been stated in Offenbach that the container was one of two bought for research work, and the gas has never been manufactured at Offenbach or used for dye manufacture there. Phosgene gas is one of the poison gases used in warfare on account of their potency as lung irritants.

COMPANY NEWS

IMPERIAL CHEMICAL INDUSTRIES, LTD.

An interim dividend has been declared on the ordinary shares for the year ending December 31, 1927, at the rate of 3% actual, less tax. The ordinary shares issued, amounting to about £30,000,000, are entitled, after a payment of a cumulative dividend at the rate of 7% on the preference capital, to a non-cumulative dividend at the rate of 7% per annum, and to two thirds of the surplus divisible profits.

BELL'S UNITED ASBESTOS CO., LTD.

An interim dividend has been declared on the old ordinary shares, Nos. 1 to 140,000 and Nos. 200,001 to 353,532 of 1s. per share, being 5% (actual), less tax, on account of the current year. In raising the interim dividend from 2½% to 5%, the directors state they are merely reverting to their practice prior to 1921, and it is no indication that an increased total dividend for the year will be paid.

ANGLO-PERSIAN OIL CO., LTD.

After placing £1,300,000 to the various reserves and providing £450,000 as extra depreciation, payment has been recommended of a final dividend of 7½% less tax, on the ordinary shares, which, with the interim payment, makes the year's dividend 12½%, compared with 17½% for the previous year. The sum of £2,246,879 has been carried forward, subject to excess profits duty.

BURMAH OIL CO., LTD.

An interim dividend of 10%, less tax, has been announced, being the same as for the previous year.

ERINOID, LTD.

A final dividend has been recommended of 4% (actual), less tax, making 7%, less tax, compared with a total dividend of 10% for the previous year.

BRITISH CELANESE, LTD.

A decision of the Arbitration Court in Brussels has given the Tubize Company, states *The Times*, the right to use "Celane" processes in Belgium and other European countries. The Board of British Celane Ltd., announces that the decision only affects certain Continental rights which were never in the possession of the company, but belong to the Dreyfus-Clavel group. The decision, therefore, does not in any way affect British Celane, Ltd., or its exclusive rights for the manufacture and sale of "Celane" in Great Britain and throughout the British Empire with the exception of Canada.

BRITON FERRY CHEMICAL AND MANURE CO., LTD.

The report for 1926 shows a considerable diminution in profits compared with 1925, due to the fact that industries upon which the company is dependent for the sale of its manufactures were disorganised or entirely closed down for about eight months. After providing £8844 for debenture redemption and charging £3000 for depreciation, there remained a credit balance, including the balance brought in, of £5664, compared with £11,414. The directors decided to pay, on March 15, the dividend on the preference shares, less tax. Since resumption of ordinary trading conditions a steady expansion in the demand for acid has been experienced.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Sal ammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength, 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 80/82%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS
 Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton. C.o.R. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s. £50 per ton, according to quantity.

Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide. 2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep. 6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime. Brown, £9 10s.—£10 per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal. £6—£9 per ton, according to grade and locality. Foreign competition severe.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liquor.—9d.—10d.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.

Wood Tar.—£4—£5 per ton.

Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 7½d.—8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.

Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4½d.—2s. 5½d. per gal. Pale, 95%. 2s. 3d.—2s. 4d. per gal.

Dark, 90%. 1s. 9d.—1s. 10d.; 95%. 2s. 1d.—2s. 2d. per gal.

Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.

Benzole. Crude 65's, 9½d.—9¾d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.

Toluole.—90%. 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 4d.—1s. 5d. per gal.

Creosote.—Cresylic 20/24%—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.

Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10d. per gal. Solvent 95/160, 10½d.—1s. 4d. per gal. Solvent 90/190, 9½d.—1s. 3d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.

Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—84s.—87s. 6d. per ton, f.o.b. according to district. Market firm.

Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.

Acid H.—3s. per lb.

Acid Naphthionic.—1s. 6d. per lb.

Acid Neville and Winther.—4s. 9d. per lb.

Acid Sulphanilic.—8½d. per lb.

Aniline Oil.—7½d. per lb., naked at works.

Aniline Salts.—7½d. per lb., naked at works.

Anthranilic Acid.—6s. per lb., 100%.

Benzaldehyde.—2s. 3d. per lb.

Benidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—2s. 3d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—9d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

p-Nitraniline.—1s. 8d. per lb.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d. per lb.

p-Toluidine.—2s. 2d. per lb., ex works, naked.

m-Xyldine Acetate. 2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 4½d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—(Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrim.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. 6d. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth

Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—

8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—

8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb.

Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Sub-

chloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—

7s. 9d.—8s. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liquor

Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.

—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s.

per cwt., according to quantity, carr. paid any station in

Great Britain in ton lots:

Bromides.—Ammonium.—2s.—2s. 3d. per lb. Potassium,

1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb.

Granulated $\frac{1}{2}$ d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. 2d.—1s. 3 $\frac{1}{2}$ d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7 $\frac{1}{2}$ d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10 $\frac{1}{2}$ d.—1s. 1 $\frac{1}{2}$ d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. (Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2 $\frac{1}{2}$ %; Heavy Commercial £21 per ton, less 2 $\frac{1}{2}$ %; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.

Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonal.—8s. 9d.—9s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2 $\frac{1}{2}$ %.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal, 1s. 8 $\frac{1}{2}$ d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonal.—6s. 9d.—7s. per lb.

Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—6s. 6d. per lb.

Aubepine (ex Anethole).—10s. 6d. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.

Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.

Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 3d. per lb.

Coumarin.—9s. 9d. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. 6d. per lb.

Ethyl Phthalate.—2s. 9d. per lb.

Eugenol.—8s. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 15s. per lb. (ex Shui Oil) 10s. 6d. per lb. Linalyl Acetate.—(ex Bois de Rose) 18s. 6d. per lb.—(ex Shui Oil) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—17s.—17s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—14s. per lb.

Camphor.—75s. per cwt. Cananga, Java, 17s. per lb.

Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d per oz. Citronella.—Java, 1s. 9d. per lb., c.i.f. U.K. port, for shipment over 1928. 1s. 7 $\frac{1}{2}$ d. prompt shipment from Java. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 3d. per lb.

Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—7s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 30s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—9s. 3d. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 6d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Dec. 12th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Oct. 27th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Blau, Separating mixtures of gas etc. 26,247. Oct. 4. (Ger., 5.10.26.)

Burn and Lancaster, Mixing-machines. 26,502. Oct. 6.

Delbag-Entstaubung Ges., and Klug. Filters for gases. 26,230. Oct. 4.

Johnson (I.-G. Farbenind.). 26,709. *See* II.

Laing and McCleary. Separation of powdered etc. materials. 26,179. Oct. 4.

Marks (Dearborn Chemical Co.). Fluid-treating apparatus. 26,088. Oct. 3.

Pehrson. Extraction of substances from gases etc. 26,431. Oct. 6. (Sweden, 7.10.26.)

Siemens Schuckertwerke. 26,204. *See* XI.

Ver Mehr. Mixing-machines. 26,588. Oct. 7.

I.—Complete Specifications

16,264 (1926). Lucas. Edge-runner mills. (278,069.)

16,367 (1926). Hillier. Evaporators. (278,075.)

17,040 (1926). Pease. Washing-apparatus involving the intermixing of gases and liquid. (278,105.)

17,897 (1926). Muchka. Heat-exchange apparatus. (272,152.)

21,676 (1926). Sonsthagen. Mixing-machines. (278,152.)

21,933 (1926). Pochin and Pochin. Removing dust from grinding and like machines. (278,156.)

24,625 (1926). Smith and Smith. Mixing-apparatus. (278,177.)

29,626 (1926). Pollak (Trocknungs-, Verschmelzungs- und Vergasungs-Ges.). Annular rotary hearth ovens. (278,207.)

30,910 (1926). Marks (Traylor Engineering & Manufacturing Co.). Ball mills. (278,214.)

3607 (1927). Martinez and Kirk. Crushing and mixing mills of the edge-runner type. (278,236.)

9199 (1927). Industrial Associates, Inc. Spray-drying. (278,263.)

17,100 (1927). Poleo Feuerlösch Apparate Ges. Fire-extinguishing compounds. (273,713.)

22,047 (1927). Hillier. Evaporators. (278,299.)

*21,453 (1927). Pesca. Centrifugal separators and driers. (278,327.)

*25,433 (1927). British Thomson-Houston Co., Ltd. Crucibles. (278,367.)

II.—Applications

Anglo-Persian Oil Co., Ltd., and Wheeler. Treatment of hydrocarbon gases. 26,719. Oct. 8.

Blau. 26,247. *See* I.

Gas Light & Coke Co., Hollings, and Neath. Carbonisation of coal etc. 26,495. Oct. 6.

General Carbonalpha Co. Manufacture of hydrocarbons etc. 26,606. Oct. 7. (Holland, 7.10.26.)

I.-G. Farbenind. Hydrogenation of coals etc. 26,443. Oct. 6. (Ger., 14.10.26.)

Imray (Morgan). Gas-producing plant. 26,322. Oct. 5.

Johnson (I.-G. Farbenind.). 26,065. *See* XII. Manufacture of lubricating etc. oils. 26,332. Oct. 5. Low-temperature carbonisation of fuels. 26,444. Oct. 6. Manufacture of hydrocarbon derivatives etc. 26,445. Oct. 6. Production of combustible gases from granular fuels. 26,707. Oct. 8. Gas producers. 26,708. Oct. 8. Apparatus for purifying gases. 26,709. Oct. 8.

Koppers Co. Vertical coking retort ovens. 26,349. Oct. 5. (U.S., 8.1.27.)

Kulzinski. Distilling solid fuels. 26,583. Oct. 7. (Esthonia, 7.10.26.)

Laing and Nielsen. Distillation of carbonaceous materials. 26,177. Oct. 4.

Masterton. Gas calorimeters. 26,630. Oct. 8.

Salerni. Distillation retorts. 26,488. Oct. 6.

Spencer. Gas-scrubbers. 26,019. Oct. 3.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

Turner, and Turner & Co. Gas-producers. 26,165. Oct. 4.

16,452 (1926). Bereslavsky. Motor fuels. (258,550.)

18,631 (1926). Puening. Carbonising coal. (258,942.)

617 (1927). Kay. Apparatus for cracking oils. (276,947.)

2574 (1927). Tormin. *See* X.

3429 (1927). I.-G. Farbenind. Catalytic oxidation of carbon monoxide. (265,624.)

3477 (1927). Jansen. Cracking hydrocarbons. (278,235.)

*20,866 (1927). Sundin. Producing carbonic acid gas. (278,304.)

*24,120 (1927). I.-G. Farbenind. Manufacture of motor fuels. (278,341.)

*25,631 (1927). British Thomson-Houston Co., Ltd. Anti-sludging means for oil. (278,365.)

*25,861 (1927). Patentakt. Gröndal-Ramen. Manufacture from bituminous shales of a product for dry distillation. (278,378.)

IV.—Applications

British Alizarine Co., Ltd., and Barnard. Manufacture of dyestuffs etc. 26,380. Oct. 6.

Carmmael (I.-G. Farbenind.). Manufacture of substituted indoles. 26,223. Oct. 4. Manufacture of cyanogen chloride. 26,225. Oct. 4.

I.-G. Farbenind. Manufacture of chlorine substitution products of 1-amino-2:4-dimethylbenzene. 26,483. Oct. 6. (Ger., 6.10.26.) Production of azo dyestuffs etc. 26,565. Oct. 7. (Ger., 22.10.26.)

Soc. Chem. Ind. in Basle. Purifying vat-dyestuffs. 26,482. Oct. 6. (Switz., 6.10.26.)

Soc. Chem. Ind. in Basle. Purifying vat-dyestuffs. 26,482. Oct. 6. (Switz., 6.10.26.)

VI.—Applications

- Ahnert. Mercerising cotton. 26,112. Oct. 3.
 Heberlein & Co. Treatment of fabrics. 26,213. Oct. 4.
 I.-G. Farbenind. Treatment of fibrous materials. 26,706.
 Oct. 8. (Ger., 22.5.25.)

VII.—Applications

- Carpmael (I.-G. Farbenind.). Manufacture of white titanous acid. 26,224. Oct. 4.
 Lacell, and New Metallurgy, Ltd. Production of chlorides from metallic oxides etc. 26,546. Oct. 7.
 Lambert, Robson, and National Processes, Ltd. Manufacture of sulphuric acid. 26,056. Oct. 3.
 Metallbank und Metallurgische Ges. Producing zinc salts. 26,614. Oct. 7. (Ger., 7.10.26.)

VII.—Complete Specifications

- 16,670 (1926). Smith, and Chemical and Metallurgical Corp. Treatment of lead chloride and winning lead from ores, residues, etc. (278,093.)
 19,323 (1926). Kyber. See IX.
 25,053 (1926). I.-G. Farbenind. Continuous distillation of crude carbon bisulphide. (260,236.)
 5251 (1927). I.-G. Farbenind. Treatment of crude nitrate of soda. (266,735.)
 *24,881 (1927). Fischer. Radioactive material. (278,347.)
 *25,740 (1927). I.-G. Farbenind. Extracting clay etc. with acids. (278,370.)

VIII.—Complete Specifications

- 16,266 (1926). Longenecker. See X.
 18,655 (1926). Duffield. Manufacture of bricks etc. from dolomite etc. (278,120.)
 13,372 (1927). British Thomson-Houston Co., Ltd. Methods of tinting glass. (271,481.)

IX.—Application

- Pontoppidan. Grinding cement etc. 26,689. Oct. 8.

IX.—Complete Specifications

- 19,323 (1926). Kyber. Manufacture of fused cement and gases containing phosphorus. (256,622.)
 29,295 (1926). Forsen. Manufacture of hydraulic cements. (272,163.)
 32,046 (1926). Rutgerswerke A.-G. Wood preservatives. (266,296.)
 2309 (1927). Montan, Inc. Impregnating wood. (265,206.)

X.—Applications

- Coles. Rustproofing wire etc. 26,398. Oct. 6.
 Corson. Alloys. 26,069. Oct. 3. (U.S., 20.10.26.)
 Evans. Treatment of tin scrap. 26,639. Oct. 8.
 Kelly. Alloys. 26,606. Oct. 3.
 Lacell, and New Metallurgy, Ltd. Electrolytic production of metals from their oxides. 26,339. Oct. 5.
 McClusky. Recovery of precious metals from ores. 26,589. Oct. 7. (U.S., 8.10.26.)
 Siemens und Halske A.-G. Manufacture of metallic beryllium etc. 26,442. Oct. 6. (Ger., 7.10.26.)

X.—Complete Specifications

- 16,246 (1926). Mathesius and Mathesius. Manufacturing steel in open-hearth furnaces. (258,835.)
 16,266 (1926). Longenecker. Refractory blocks for metallurgical furnaces. (278,070.)
 16,070 (1926). Smith, and Chemical and Metallurgical Corp. Ltd. See VII.
 22,465 (1926). Vulcan Detinning Co. Electrodeposition of tin. (269,474.)
 22,883 (1926). Kirchhof. Treating aluminium to render it weldable. (278,164.)
 30,094 (1926). Maximoff, Costa, and Krebs. Refining steel and pig-iron. (262,136.)
 2574 (1927). Tormin. Production of coke and ore masses. (265,228.)

- *27,924 (1926). Weishan. Production of soft-iron. (278,303.)

- *25,355 (1927). Corson. Alloys. (278,355.)

XI.—Applications

- Coles. 26,014. See XIV.
 Gore and Upward. Primary electric batteries. 26,092. Oct. 3.
 Lacell, and New Metallurgy, Ltd. 26,339. See X.
 Richardson. Electric etc. furnaces. 26,392. Oct. 6.
 Siemens Schuckertwerke. Electric gas-purifying plant. 26,204. Oct. 4. (Ger., 5.10.26.)

XI.—Complete Specifications

- 10,312 (1926). Fromont. Plates for electric accumulators. (250,985.)
 22,465 (1926). Vulcan Detinning Co. See X.
 32,943 (1926). British Thomson-Houston Co., Ltd. Electric furnaces. (263,857.)
 2663 (1927). British Thomson-Houston Co., Ltd. Electric furnaces. (265,950.)

XII.—Applications

- Böhme A.-G. Treatment of fats etc. 26,573. Oct. 7. (Ger., 25.11.26.)
 Johnson (I.-G. Farbenind.). Separation of oils from mixtures. 26,065. Oct. 3.

XII.—Complete Specifications

- 16,471 (1926). Lüdecke and Lüdecke. See XVIII.
 19,207 (1926). Akt. Forsøksdrift. Extracting oil from the blubber of marine animals. (257,582.)
 20,754 (1926). Downs and Bellwood. Extraction of oil from vegetable seeds etc. (278,145.)

XIII.—Applications

- Bailey. Manufacture of liquid packings, varnishes, etc. 26,307. Oct. 5.
 Carpmal (I.-G. Farbenind.). 26,224. See VII.
 Marks (Alox Chemical Corp.). Artificial shellac. 26,466. Oct. 6.
 Softening-agent for nitro-cellulose coating compositions. 26,467. Oct. 7.

XIV.—Applications

- Coles. Electrodeposition of rubber. 26,014. Oct. 3.
 Dunlop Rubber Co., Ltd., Murphy, and Twiss. Manufacture of transparent vulcanised rubber. 26,280. Oct. 5.
 Imperial Chem. Industries, Ltd., Hailwood, Naunton, and Shepherdson. Introducing chemicals into rubber etc. 26,616. Oct. 7.

- Johnson (I.-G. Farbenind.). Colouring rubber. 26,446. Oct. 6.

- Marks (Rubber Service Laboratories Co.). Vulcanisation of rubber. 26,585. Oct. 7.
 Naugatuck Chemical Co. Vulcanising rubber etc. 26,328 and 26,342. Oct. 5. (U.S., 1.11.26 and 9.12.26.)

XIV.—Complete Specifications

- 16,101 (1926). Liverpool Rubber Co., and Amende. Vulcanisation of rubber. (278,064.)
 23,712 (1926). Hercules Powder Co. Reclaiming rubber and fabric from scrap. (274,797.)

XVII.—Complete Specifications

- 16,471 (1926). Lüdecke and Lüdecke. See XVIII.
 *27,455 (1926). Raffinerie Tirmontaise. Decoloring sugar crystals. (278,302.)

XVIII.—Complete Specifications

- 16,471 (1926). Lüdecke and Lüdecke. Production of glycerin from sugar by fermentation. (278,086.)
 *8535 (1927). Commercial Solvents Corp. Butyl-acetonic fermentation. (278,307.)

XIX.—Application

- Ludwin (Jerabek). Preservation of meats. 26,658. October 8.

XX.—Applications

Böhme A.-G. Production of pyridine compounds. 26,447. Oct. 6. (Ger., 10.11.26.)

(Consort. f. Elektrochem. Ind. Manufacture of acetic anhydride. 26,323. Oct. 5. (Ger., 18.10.26.)

I.-G. Farbenind. Manufacture of condensation products from urea etc. 26,214. Oct. 4. (Ger., 4.10.26.)

Imperial Chem. Industries, Ltd., and Coffey. Manufacture of acyl derivatives of beta-ketonic esters and beta-diketones. 26,475. Oct. 6.

Johnson (I.-G. Farbenind.). Production of solutions of organic compounds etc. 26,705. Oct. 8.

Marks (Alox Chemical Corp.). Oxidation of hydrocarbons. 26,464. Oct. 6.

XXI.—Complete Specifications

11,414 (1926). I.-G. Farbenind. Manufacture of therapeutic agents. (251,651.)

30,216 (1926). Marks (U.S. Industrial-Alcohol Co.). Distillation of alcohol. (278,211.)

*8535 (1927). Commercial Solvents Corp. See XVIII.

*20,353 (1927). I.-G. Farbenind. Manufacture of acetaldehyde. (278,324.)

*25,182 (1927). Deleo-Light Co. Methyl ether. (278,353.)

*26,214 (1927). I.-G. Farbenind. Manufacture of condensation products from urea and an alcohol or a ketone. (278,390.)

XXI.—Application

Halden & Co., Ltd., and Holden. Photographic light-sensitive surfaces etc. 26,653. Oct. 8.

XXII.—Application

Hercules Powder Co. Preparation of nitrocellulose. 26,341. Oct. 5. (U.S., 8.6.27.)

XXII.—Complete Specification

12,908 (1926). I.-G. Farbenind. Treatment of nitrocellulose to render it safe. (252,382.)

XXIII.—Application

Sim. De-aerating feed water for boilers. 26,285. Oct. 5.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Argentina*: Nickel sheets, zinc sheets and ingots, other metal lines, asbestos, galvanised sheets, articles for polishing metals (310); brass bedstead tubes, brass sheets (311). *Belgium*: Vanilla (300). *British India*: Semi-diesel and cold-start crude oil engines (297). *Egypt*: Diesel engine (B.X. 3885). *Holland*: Porcelain and earthenware (303). *New Zealand*: Filtration plant (A.X. 5319). *Turkey*: Cast-iron pipes (A.X. 5332).

Dyestuffs (Import Regulation) Act, 1920

The following statement, relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during September, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee.

The total number of applications received during the month was 651, of which 512 were from merchants or importers. To these should be added 24 cases outstanding on August 31, making a total for the month of 675. These were dealt with as follows:—Granted, 598 (of which 562 were dealt with within seven days of receipt);

referred to British makers of similar products, 64 (of which 48 were dealt with within seven days of receipt); referred to reparation supplies available, two (both dealt with within two days of receipt); outstanding on September 30, 1927, 11.

Of the total of 675 applications received, 612, or 91 per cent. were dealt within seven days of receipt.

Instruments for Collieries

Scientific methods are being increasingly applied in the coal industry, and it is of interest to draw attention to a folder published by the Cambridge Instrument Co. Ltd., which reproduces a number of photographs illustrative of scientific methods as applied to colliery plant, and as used in government and other research stations. Instruments for power plant, coke ovens, experimental explosion chambers, as well as oscillographs, thread recorders, etc., are amongst those illustrated.

A New Dyestuff

The British Dyestuffs Corporation, Ltd., has issued a new pattern card illustrating an addition to the B.D.C. range of acid colours—Lissamine Red T. This colour is particularly suitable for the dyeing of wool hosiery yarns and material for knitting purposes generally, because of its very good penetrating power in conjunction with some fastness to washing.

News from Advertisements

The Department of Scientific and Industrial Research announces that a research chemist is required for work on plasters and other materials used for impressions and models in dentistry (p. vi).

A chemist assistant is required for service in the tropics (p. vi).

A position is available in a laboratory in North-West London (p. vi).

A highly-trained chemist requires a junior partnership in a chemical concern (p. vi).

There are now 122 firms represented in our Buyers' Guide.

No. 43

EDITORIAL

International Chemistry

WE have read with much interest two notes in the News Edition of "Industrial and Engineering Chemistry" on this topic, indicating very plainly the American disapproval of the project for an International Bureau of Chemistry in Paris. The personal view of the Editor of CHEMISTRY AND INDUSTRY may not be of great importance in this connexion, but he is unable to obtain at short notice an official expression of opinion. We think that the procedure adopted by the promoters of the International Office of Chemistry was not the best that could have been chosen, and that the French chemists could have avoided many difficulties had they consulted the chemists of other nations a year earlier than they did. In France there is a close connexion between the government and chemistry; the French government contributes to the expenses of the Union Internationale and of the delegations attending foreign countries. In Great Britain there is no connexion, no contribution of this sort. British chemistry is entirely independent, and we doubt very much if public opinion in this country would favour governments taking a hand in such family matters as documentation, scientific museums, and chemical catalogues. On the other hand, when we reflect on the formation of the Union Internationale we feel compelled to offer a warm tribute to the French chemists for their cordiality and grace in meeting the wishes of the chemists of other nations. The assistance they receive from their government, and their geographical situation, give them an influence and a power which are wholly exceptional, and yet when the British chemists have, on many occasions, put forward propositions not in accordance with French ideas the propositions have been courteously considered and frequently adopted. The French chemists have ideas which differ very much from our own; nevertheless, it has always been delightful to work with them.

Better Concrete

The production of better concrete from normal Portland cement concerns all chemical manufacturers

who lay their own concrete, but, in addition, as a demonstration of the value of research upon a material which has been extensively used in constructional work for over a century, it is of interest to all who profess and call themselves chemists. Rapidly hardening concretes and concretes possessing other special characteristics such as resistance to alkali attack can be made with the aid of the newer aluminous cements, special Portland cements and other materials, but the common Portland cement, much more generally used, may be made to give better concretes than were obtained a few years back or, alternatively, equally good concretes at lower costs.

It has been conclusively shown that the amount of water used per unit weight of cement is the main factor which determines the quality of the final concrete, and the water-cement ratio law appears to have proved in its application that water is the most important single factor in the production of concrete of high strength. It has been put to us in this way: The addition of each pint of water above the proper amount has the same effect upon the strength of the concrete made as leaving out a quart of cement.

What, then, is the water-cement ratio law. Simply this, that thousands of experiments carried out by numerous investigators and confirmed in large-scale practice have proved beyond reasonable doubt that each bag of cement must be mixed with a definitely-ascertained amount of water. For concrete showing a compressive strength of 2000 lb. per sq. inch at 28 days, 6.75-7.5 gals. of water must be taken for every bag of cement. For concrete of a strength of 3000 lb., 5.5-6.0 gals. of water must be used, whilst as the required strength at 28 days rises, the amount of water to be used falls in a degree which may be ascertained from published tables. Good concrete can, of course, be made by more or less haphazard methods, but far more cement than is really necessary will almost invariably be used. By setting the water-cement ratio law at the base of mixing, equally

strong concretes can be made with assurance and economy.

It is not the place to enter into details of the application of the water-cement ratio law, but one or two points may be mentioned if any semblance to an outline of procedure is to be achieved. The sand and gravel aggregates used with cement in the production of concrete usually contain some water, which must be taken into consideration. If, for instance, the so-called 1:2:4 mix is being made, a cubic foot of cement—one bag—becomes associated with 2 cubic feet of sand and 4 cubic feet of gravel. Now a cubic foot of "dry" sand contains 0.2 gals. of water and a cubic foot of damp sand contains 0.6 gals. of water. Similarly, a cubic foot of "dry" and damp gravel contain respectively 0.0 and 0.1 gals. of water. Since, then, in all, a bag of cement must be mixed with 7 gals. of water in order to produce a concrete attaining a strength of 2000 lb. per square inch in 28 days, and since in the two cubic feet of, let us say, damp sand there are 2×0.6 gals. of water, and in the four cubic feet of damp gravel there are 4×0.1 gals. of water, or a total of 1.6 gals. of water in the combined damp aggregates the actual amount of mixing water must obviously be $7.0 - 1.6$ or 5.4 gals.

Further, the workability of the mix is of moment to the practical man, and attention must be paid with some care to this phase of concrete making. Some classes of work require a more plastic mix than others. Thus in general construction work a reasonably plastic mixture is needed in order to allow the concrete to be placed in the "forms" or around the reinforcing bars. Concrete for roadway construction can be made much drier, whilst in the manufacture of concrete blocks or tiles still less water is commonly employed so that the moulded article will "stand up" when removed from the machine. If we were to attempt to sum up the difficult question of workability in a single sentence we should say that the great essential is to use as nearly the correct amount of water demanded by the water-cement ratio law as is possible without sacrificing general workability. The relative amounts of fine and coarse aggregates may be varied, and, in short, the experience of the practical mixer may be relied upon to give the best "mix," containing the greatest possible amount of aggregates consistent with workability, density, and the most suitable amount of water.

We have been assured by ultra-conservative practical men that "the thing is impossible," and, indeed, it may often appear so at its first trial, but a survey of the specialised literature which has appeared in the last year or two seems to show - it is with some trepidation we write this as mere lookers-on—that the water-cement ratio law is essentially practicable. Much helpful information has been published and the successes of many contractors, particularly we suppose in America, where the law was discovered and first applied, leave no doubt in our mind that a new practical and economical method of making good concrete has been evolved. The water-cement ratio law is worthy of careful examination by all interested in the making of concrete.

THE GROWTH OF THE SCIENTIFIC TEXTBOOK

By JOHN E. CHANDLER

To write an article on the evolution of the scientific textbook would probably take more space than the Editor of this JOURNAL would care to give to the subject, as it would require some research into the origins, and also the use made, of the writings of those who spoke with a certain knowledge of the subject they practised in their day. It is therefore my intention to deal with the growth of some of the more modern books, and to show that the progress in the various sciences is made obvious by the books which deal with the subject.

There is one book which for many generations has been the favourite of the medical student, Henry Gray's "Anatomy, Descriptive and Surgical." The first edition of this wonderful work was published in 1858, and in those days was a bulky volume of 750 pages, but the illustrations were so remarkably good that many of them form the basis of the illustrations in the edition on sale to-day. The illustrations in this work when first published contained a certain amount of colour, and numbered in all 363. During the 69 years since this work was published, it has gone through twenty-three editions, and is now a volume of 1400 pages and 1294 illustrations, of which 616 are coloured. What an amount of knowledge has been gathered together by the various Editors since Gray's death in 1861 is represented in the additional pages and illustrations the work now contains.

Another instance with which the readers of this JOURNAL are more intimately acquainted, is Sir Edward Thorpe's "Dictionary of Applied Chemistry," which was first published as a work of three volumes. The first volume appeared in 1890, and volume three in April, 1893. This edition was several times reprinted, but a new edition was launched in 1912 in five volumes, in which the compiler said that during the last twenty years chemistry had advanced at a rate and to an extent altogether unprecedented in its history, or, indeed, in the history of any other science. Accordingly, in the attempt to make the new edition reasonably adequate as a presentation of contemporary knowledge, it had been found absolutely necessary to enlarge greatly the original scope of the book. Again the science has developed at such a rate that a new edition has now been published in seven volumes, and Sir Edward Thorpe, in introducing the first volume of the new edition, said: "It has become a truism to say that applied chemistry has exercised a profound influence on the character and direction of the war. It is equally true that the war has exercised a great influence on applied chemistry. It has led to an enormous expansion, more or less permanent, of certain branches both in this country and abroad. New products have been made, new processes have been devised, and established methods have been improved and extended." We know that what Sir Edward said was quite true, and naturally it affected the larger part of the articles in his great work. It is regretted by all scientific workers that Sir Edward Thorpe did not live to see the publication of the sixth and seventh volumes of his Dictionary, though, as a matter of fact, the articles were practically all in his

hands at the time of his death. One of the features of this new edition is the inclusion in the last volume of a detailed index of the whole work. It is interesting to note that the final revision for the press of the last two volumes was carried out by Dr. H. Forster Morley, who was one of the joint editors of the last edition of Watts' "Dictionary of Chemistry," another work which went through many editions, and has been reprinted on many occasions.

One of the great features of recent day scientific literature is the introduction of "Monographs" on the branches of the various sciences. The first issued in this country was a series of Monographs on Biochemistry, edited by Dr. R. H. A. Plimmer and Sir F. G. Hopkins. Sir Edward Thorpe edited a long series of books, as Monographs on Industrial Chemistry. Professor Starling had a series on Physiology, and Professor Findlay edited a series on Inorganic and Physical Chemistry. In the world of Physics, Sir J. J. Thomson, O.M., F.R.S., with Dr. Frank Horton, edited a series of Monographs on Physics. One of the first volumes of the series was: "Positive Rays and their Application to Positive Analyses," by Sir J. J. Thomson himself. There were other volumes on "Photo-Electricity," "Relativity and the Electron Theory," "Emission of Electricity from Hot Bodies," "Modern Seismology," etc. These various monographs were a great help to the student who wished to work up a certain subject and did not wish to wade through a complete treatise to get the matter he specially required.

If we go further back, we find in 1870 a series of text-books was arranged under the title of "Textbooks of Science," first edited by Professor T. M. Goodeve, but the active editor for many years was Charles W. Merrifield, F.R.S. This series was originally sold at 3s. 6d. each, and it was stated that the origin of the series was a report of the Public Schools Commission and of the Schools Inquiry Commission, as well as evidence taken before several Parliamentary Committees, who endeavoured to show that there was a want of a good series of text-books in science, thoroughly exact and complete, to serve as a basis for the sound instruction of artisans, and, at the same time, sufficiently popular to suit the capacities of beginners. The foundation of the Whitworth Scholarship was said to be in itself an evidence of the recognition of that want, and the reason for the production of a series of chemical and scientific works adapted to that purpose. That this series was of value at the time is evidenced by the fact that many of the books in this series are being used to-day. It was in this series that Professor J. Clerk Maxwell's famous classic "Theory of Heat" was issued.

It was also in the 'sixties and 'seventies of the last century that Professor John Tyndall, F.R.S., was issuing his marvellous series of text-books which were pioneers in the subjects with which they treated. His "Heat Considered as a Mode of Motion," his Lectures on Sound, Light, and other subjects, were also read by the general public.

There were other series of text-books of a more or less elementary kind; the London Science Class Books, edited by G. Carey Foster, F.R.S., and Sir Philip Magnus,

contained books, many of which are in use to-day. "Astronomy," by R. S. Ball, F.R.S., and "Geometry," by Professor O. Henrici, F.R.S., were two very popular volumes in the series.

The popular series of Science Primers edited by Professor Huxley, Sir H. E. Roscoe, and Professor Balfour Stewart were known to many students in the latter quarter of the last century, as they are known to the students of to-day.

Perhaps the most important work that is now being written is the monumental work of Dr. J. W. Mellor, who has recently been elected a Fellow of the Royal Society. This work, known as "A Comprehensive Treatise on Inorganic Chemistry," is already announced to run to 13 volumes. It is a work which aims at giving a complete description of all the compounds known in inorganic chemistry, and, wherever possible, these are discussed in the light of the so-called physical chemistry. In this work the student will find the growth of the leading principles and doctrines traced from their appearance as hazy and vague conceptions, and he can perceive that present-day chemistry is but a stage in the wonderful process of evolution. The teacher can use the work by selecting special sections for collateral reading by his students, and the research chemist will find general summaries with bibliographies that will save him many months of searching. The volumes already published contain about 1000 pages in each, and each page contains many hundreds of words. This work is the more remarkable as it is the work of one man. His other works, "Introduction to Modern Inorganic Chemistry," "Modern Inorganic Chemistry" and "Higher Mathematics," are known to all students of the science.

A book I remember very well is the translation of Ganot's "Éléments de Physique." This work was edited by Dr. E. Atkinson, who at the time was Professor of Experimental Science in the Royal Military College, Sandhurst. Many editions of this book were published, as were also that of the same author's work on Natural Philosophy. I think I am right in saying that this book was more or less superseded by the late William Watson's "Textbook of Physics," "Intermediate Physics," and "Textbook of Practical Physics." Ganot's illustrations were all of a pictorial nature, and many of them were used in various books by several publishers for a number of years. Watson illustrated his book by diagrams, and treated his subject more mathematically.

What the late Sir Edward Thorpe did for chemistry Sir R. T. Glazebrook has done for applied physics. His Dictionary is published in five volumes, and covers the ground in a comprehensive manner.

How the growth of a subject affects the text book is shown in a remarkable manner in Prof. E. C. C. Baly's work on Spectroscopy, which was first published in 1905 in a crown 8vo volume of 580 pages. Prof. Baly has just prepared a third edition of his work, which is to run to four demy 8vo volumes, the third volume of which has just been issued and alone runs to 540 pages. No doubt similar instances can be found in other subjects.

If one takes the trouble to go through the catalogue of British Scientific and Technical Books prepared by a committee of the British Science Guild, of which

Sir Richard Gregory is chairman, it will be at once realised that it is impossible in a short article to mention more than a few of the books which have made history in the science with which they deal. Around the majority of the books there is, no doubt, a story which would make interesting reading. Probably a few of them have been written in a similar way to the late Miss Acton's "Modern Cookery." Miss Acton first offered to the publishers a volume of poems, and the publisher, wishing to pacify the lady, regretted he was unable to publish her verse, but suggested she should write a cookery book, little thinking he would ever hear of her again. She took his advice to heart, prepared a cookery book, which had a life of over fifty years!

THE REVIEWING OF BOOKS

Books, dreams, are each a world, and books, we know,
Are a substantial world, both pure and good;
Round which, with tendrils strong as flesh and blood,
Our pastime and our happiness may grow.

How should we judge the merits of a book? To begin with, we must consider what sorts of books we have in mind, and for our present purpose we will confine our remarks to scientific books, omitting even from these the books which are not intended to be read, and are merely handy museums of scientific facts. Macaulay was of opinion that "the first rule of all writing—that rule to which every other is subordinate—is that the words used by the writer shall be such as most fully and precisely convey his meaning to the great body of his readers." We have no doubt that in many respects this is an admirable rule, but there are occasions when it should be disregarded. The first requisite, perhaps assumed by Macaulay, is that the book is readable: however many faults of style, of grammar, of taste, and so on the book has, if it is readable that is the great thing; many unreadable books could be written which were free from every fault except that they were uninteresting. Take our anonymous correspondent, CALORIFER, as an instance; he fills his writing with pitfalls for the unwary, so that reading his passages is like an obstacle race; he dilutes his facts with great masses of extracts from "The Hunting of the Snark," so that the facts are surrounded by an indefinable wrapping, resembling the solvation cloak covering the poor naked little ions in a solution; he has other characteristics of which he is proud; pleasant enough it is to hear folks speak of our virtues, but in our secret hearts 'tis of our faults we are proud. Nevertheless, the effusions of CALORIFER are readable. His sins were scarlet, but his books were read, as Belloc, or some one else, wrote. CALORIFER and LUCIFER are now getting ready for the fray, rather like Strachan and Chatham, a little slow in getting to grips with each other, still we are hopeful. Is the Lucifer who writes to us a follower of that shining Assyrian prince of whom the hexameter was written: How art thou fallen from Heaven, O Lucifer, son of the morning? Or is our Lucifer the follower of the Prince of Darkness? We do not know.

Whether fulness and precision are of more consequence than readability we may leave to others to decide. All will agree that the three qualities should be present, and that the proportions vary with the taste and age of each reader. When we were twenty or so and study-

ing for some examination or other we preferred books from which all extraneous matter was eliminated; even in those days, even with the steep cliff of an examination looming in front of us, we found both delight and profit in reading such books as Tyndall's Sound, Cooke's New Chemistry, and Maine's Ancient Law. From the time when we students attain years of discretion we steadily grow wiser; we want fewer facts and more explanations in the books we read. We may have struggled for years with an overwhelming mass of ill-digested facts; the wisdom which adversity has bred teaches us to know where to find our facts rather than to know the facts. The critic who is judging of the merits of a scientific book must therefore consider whether the book is a cram book or a study book; whether it is a hat-stand capable of containing a great number of hats or whether it is just a heap of hats.

Literature is highly conventional; poetry is exceptionally conventional. Many centuries ago some poetic shepherd, some Robert Burus, living in Crete or Sicily or Lesbos, wrote pastoral poetry; this inspired others to imitate him, and we have a long series of poets who have closely followed the classical pastoral style, including Theocritus, Virgil, Spenser, Milton, Wither, and Tennyson. Their very phrases have been copied, translated, altered and compressed until we are driven to believe that there is nothing spontaneous in any of the pastoral poetry now extant. The little short, trifling essays, first employed, so far as we remember, by Montaigne, were followed by Steele and Addison, and since their time by scores of great writers and small writers, so that now each daily paper and each weekly journal finds it necessary to observe the convention. Don Quixote and Gil Blas were the prime causes of Tom Jones, Humphrey Clinker, Tristram Shandy, Moll Flanders, Pamela, Evelina, Rob Roy, Esmond, and Bleak House. The trifling essays are a modern invention; the cistern of knowledge is in the case of most men soon emptied; the supply of airy badinage is not a cistern; it resembles rather the oil supply in Texas or the volcanic steam at Larderello. The editor must therefore be economical of his facts; as soon as he ceases to write trifles he writes lies, and such lies. The editor has merely to choose an evening when frost and mud and snow and rain proclaim the jocund spring, and sit, choked up with fame and sea-coal fires, busy with his soft pipe and more than human port, as Milton has it, wrapt in a pleasing fit of melancholy to meditate his next week's effusion. In the summer you cannot bar his constant feet to trace the woods and lawns by living stream at eve; give him a few shelves full of poetry, a few shelves full of scientific books, and a few friends who are experts in the science, and he can carry on week after week and year after year.

Chemistry wants a few more really readable and really accurate chemical books. There are a few, but as yet no one has attained so striking a popularity as to start a fashion. Chemistry in the XX Century, we think, is very good; Andrade's sixpenny book on the atom shows that this subject can be accurately treated in popular and charming language; we are confident that combustion, explosion, catalysis, hydrocarbons, and biochemistry can be similarly treated so soon as a few people set a good example.

THE FERTILISER INDUSTRY

The Imperial Agricultural Research Conference visited the nitrogen-fixation works of Synthetic Ammonia & Nitrates, Ltd., at Billingham, on October 18. Sir Alfred Mond, chairman of Imperial Chemical Industries, Ltd., was to have received the Conference, but in his absence on account of indisposition, Lt.-Col. Pollitt, D.S.O., took his place and read Sir Alfred's address.

Sir Alfred first explained that the need for synthetic nitrogenous fertilisers had been long felt, and quoted the presidential address to the Society of Chemical Industry nearly 40 years ago, in which his father, Dr. Ludwig Mond, emphasised this need. He then described how the great Billingham factory began, and mentioned their difficulties, the eventual solution of which was one of the most brilliant triumphs of British engineering and chemistry. They were not content with setting themselves the ambitious task of supplying the whole Empire with fertilisers. They had a large experimental agricultural station of their own, and were anxious to co-operate with similar institutions throughout the Empire.

Sir Alfred then showed that the war was fought on Chilean nitrate as far as this country was concerned. Any failure to keep open the long sea route would have meant irrevocable national disaster. The very processes used to convert nitrate of soda into explosives in the war, which were all worked out and carried through by the Company, were difficult, trying to a degree in their initiation, and quite uneconomical. This state of affairs could never happen again. In the event of any future danger to the Empire, that organisation would have no difficulty in rapidly and economically producing the essential raw materials of explosives: ammonia and nitric acid.

Some of the other activities on that site were of interest to agriculturists. The mechanisation of agriculture was proceeding apace. As they went through the works they would be struck with the continuity and mechanised character of the processes employed. It might happen that the chemical industry would be called upon to provide large centralised plants for agricultural operations, such as the drying and baling of grass, and if they ever were asked to do so, their general experience of the handling of materials of every description would be invaluable, and was at their service.

Britain had become over-industrialised. She had lost the balance between agriculture and industry. He felt that the fertiliser industry would help to restore the balance between industry and agriculture to equity. The extended use of fertilisers such as they were now beginning would play a large part in encouraging agriculture and thereby assist in increasing the prosperity and cohesion of the Empire. As the world continued year by year to absorb the vast and ever-increasing output of synthetic nitrogenous fertilisers, it was evident that they would not remain content to produce a quantity which, though large in itself, was small in comparison with the world's output and the requirements of the Empire. They would not be content with merely participating on the basis of their present production. Additional units were to be erected immediately. They would endeavour to keep pace with the increased

Imperial and world demand. Foreseeing the possibility of these great developments, they recognised that a selling organisation must be formed on such a scale that it would be capable of handling not only existing supplies of fertilisers, but also the potentially vastly greater quantities which they expected to make. The consequence of this had been the formation of Nitram, Ltd., which combined all the previous existing selling organisations with the additional help which they had been able to give. New knowledge and new sources of power must, however, be made known before they were widely used, and therefore Nitram, Ltd., determined that, side by side with the large selling organisation which it had formed, there must be a no less large and world-wide organisation whose business it should be to make known the uses and values of the new synthetic fertilisers. The admirable service instituted by the British Sulphate of Ammonia Federation formed the nucleus of this advisory service of Nitram, Ltd. This service was rapidly growing: already it had a large staff of district advisers located in all parts of England, Scotland and Ireland, whose sole duty it was to give free and disinterested advice to farmers on the use of fertilisers— not only nitrogenous fertilisers, but fertilisers of all kinds.

Nitram, Ltd., had also established a research station, where problems relating to the use of fertilisers and to the feeding of stock were to be investigated. One of the most important subjects which would be undertaken at the research station was the experimental enquiry as to the synthetic fertilisers most suitable to the British and overseas requirements, for it was evident that the synthetic manufacturing activities of Billingham were not likely to be confined to the manufacture of simple nitrogenous fertilisers, such as sulphate of ammonia, but would extend to the production of what may be called dual and triple fertilisers. There would be sulphate of ammonia or synthetic nitrate or urea, etc. to supply the nitrogen requirements of the soil; there would be ammonium phosphate for the soils which needed both nitrogen and phosphates; and there would be complete chemical compound fertilisers, containing the three chief plant foods, to be used by all who cultivated the land intensively.

Great prosperity would come to those countries which were first to seize and apply the new and great opportunities which presented themselves now that the synthetic manufacture of fertilisers was an established fact. Nitram, Ltd., therefore felt that it had not only a commercial duty to fulfil, but also a national duty. For this reason the energies of its staff were being directed especially to the agriculture of England, Scotland and Ireland. It was clear that with these new resources at its service, British agriculture was furnished with the powerful means of reinforcement in the struggle which it had been waging for years with manifold adversities. All must hope that plentiful supplies of synthetic fertilisers would help agriculture to maintain the struggle so that when world conditions become more favourable, prosperity might once again smile on the most essential of all British industries. Concluding, Sir Alfred Mond pointed out that mankind was at the cross roads. To those who had vision and the

opportunity of applying that vision to national and imperial problems the opportunity awaited, and it must be seized. Science applied with vision could increase the natural wealth of the world, and could inaugurate that reign of peace and prosperity without which our present civilisation would go backwards instead of forward.

A WORD TO "CALORIFER"

By "LUCIFER"

I have read, with more amusement than illumination, "Calorifer's" effusion in CHEMISTRY AND INDUSTRY upon the subject of Bone and Townend's book. I do not propose saying anything either about the book, for that will take care of itself, or yet about the experiments recorded therein, for in the long run they will prevail against mere assertions devoid of any experimental basis.

Seeing, however, that "Calorifer" has quoted Francis Bacon's aphorism concerning the choice of words, I feel moved to say that his style of argument provides an admirable illustration of the truth of the following passages in the "Novum Organon":—

"The human Intellect, in those things which have once pleased it (either because these have been received and believed, or because they delight,) draws also all other things to vote with and consent to these—and though the weight and multitude of contrary instances be the greater, yet either it does not observe them, or despises them, or draws distinctions, and so removes and rejects them—not without great and pernicious prejudice—in order that the authority of those previous conclusions may remain unshaken. . . . But in Philosophy and the Sciences this evil creeps in far more subtly—for there anything which has once approved itself to man corrupts all other things (even though they be far surer and more powerful) and reduces them under itself. Furthermore, even though this satisfaction and vanity, of which we have spoken, were absent, yet such is the peculiar and perpetual wandering of the human Intellect, that it is more moved and roused by affirmatives than by negatives. Whereas properly it ought to be just to both, nay even, in the framing of any axiom, the force of the negative instance is the greater."

Again, "The human Intellect is not of the nature of a dry light, but receives a tincture from the will and affections; which generates accordingly knowledge *ad quod vult* (according to its own wishes), for what a man would rather was true, that he the more readily believes. And so it rejects what is difficult, being impatient of inquiry; what is sober, for it straitens hope; the deeper things of nature, for it is superstitious; the light of experience, for it is arrogant and proud,

I also, like Prof. Bone, am a humble Baconian in believing that "the subtilty of Nature far surpasses the subtilty of sense and intellect," and that "*Anticipations* are far more powerful in winning assent, than *Interpretations*; since, being gathered out of a few instances, and these too for the most part those which occur familiarly, they forthwith dazzle the intellect, and fill the imagination; whereas, on the other hand, *Interpretations*, being gathered widely from things very various and far separate, cannot suddenly strike the intellect; so that necessarily

they must seem, as harsh and discordant opinions, almost like mysteries of the faith."

It seems to me that "Calorifer" exalts vain ratiocinations above experiments, and that he ought to read more carefully what the experimentalists say about their methods and discoveries. For I would rather trust the judgment of a man who, following experience, daily brings his mind in contact with realities than of one who, making no experiments, indulges his mind in wild guesses and conceits, which are apt to breed vanity and impatience.

As for "Calorifer's" friend the Sage of Lewisham, I have long suspected him of being at core a medievalist; and when, the other day, he advocated the shutting up of the laboratories and the settlement of these matters intellectually, he stood self-revealed as one. For some years past he has been out against the "modernists" in chemistry, among whom Prof. Bone is numbered. It seems to me he might be better employed by the Church to confute the "false and heretical teaching" of the Bishop of Birmingham. For a man who can argue so learnedly about the supposed chemical function of "hydrone" (steam) in flames, even where the spectroscope entirely fails to reveal it, ought to be a doughty champion of the "real presence" against our "modernist" Bishop. I have yet hopes of hearing him preach in St. Paul's, if the space is not too confined.

CANADIAN INDUSTRIAL NOTES

The four leading wallpaper companies, Reg. N. Boxer Co., Ltd., the Watson, Foster Co., Ltd., Stauntons, Ltd., and Colin McArthur & Co. Inc., operating in New Toronto, Toronto and Montreal, have been acquired by the Wallpaper Manufacturers Ltd., and incorporated as the Canadian Wallpaper Manufacturers, Ltd., with a capital of \$3,725,000. The parent British company will assist with technical knowledge and experience. There will be no public financing.

The Montreal Coke & Manufacturing Co. (subsidiary of Montreal Light, Heat & Power Co., and the Koppers Co., of Delaware) has purchased a 70-acre site at Ville La Salle, adjoining the gas-works of the M.L.H. & P. Co., and will erect coke ovens having an annual capacity of 350,000 tons of coke and 6,500,000,000 cb. ft. gas. The total capacity of the two gas and coke-producing establishments will be approximately 450,000 tons of coke and 9,000,000,000 cb. ft. gas.

Scholler Bros., of Philadelphia, will establish a large factory at St. Catharines, Ont., for the manufacture of soaps and compounds employed in the textile industry.

The maple products of Canada during the 1927 season show a considerable increase in quantity compared with 1926:—Maple sugar, 9,831,697 (7,137,303) lb., valued at \$1,365,045 (\$1,320,837); maple syrup, 2,154,705 (1,746,570) gals., valued at \$3,569,766 (\$3,575,538). The total maple sap products yielded \$4,934,811, of which \$3,105,924 is credited to the province of Quebec. The New England States manufacturers of maple products have appealed to the U.S.A. Tariff Commission for an increase in duty to protect them against the competition of the Canadian producer.

REVIEWS

A DICTIONARY OF APPLIED CHEMISTRY. By SIR EDWARD THORPE, C.B., LL.D., F.R.S. Revised, and enlarged edition. Vol. VII. Pp. viii + 768. London: Longmans, Green & Co., 1927. Price 60s.

The appearance of this last volume of Thorpe's Dictionary will stir the same thoughts among the multitude who pursue a chemical calling. First, the sadness of his not having lived quite long enough to see the completion of his last great task. Then the sense of the loss that we have sustained by the death of a leader disinterestedly devoted to our science and its causes, distinguished by ability and achievement, and memorable most of all to those who knew him by his qualities as a man. His vital energy, incisiveness and thoroughness, his scrupulous honesty, his instant fiery reaction to any stimulus of offence—all these things combined to give him a very remarkable personality and presence. His old teacher, Sir Henry Roscoe, in his characteristic way, summed it up by, at one period, always referring to Thorpe as "the electric spark."

Thorpe's achievements in the realm of chemical literature were abundant. Some had their day and ceased to be—though in some cases the day was long. But his tastes and skill went beyond the limits of textbooks, and there remain to us standing additions to our chemical libraries, notably the volume of "Essays," in which his interest in history and his capacity in *belles lettres* are admirably displayed.

There are probably many, like the present writer, in whom the very mention of a chemical dictionary raises something like a groan. The word is, perhaps, ill-chosen, for the emotion is born of wonder and sympathy. To an ordinary man, wrestling with his personal ration of weekly and monthly chemical literature and all at sixes and sevens with his noting of things that interest him, the task of editing a dictionary—unless it be one of expletives—seems something altogether behind the beyond. Yet the thing is done and often well done, and let us be thankful that there are those who can and will do it. For we need these dictionaries—they are indispensable. We hear that the article on this or that is meagre or inaccurate; in our own particular bit of theory we find there is quite notable fault. Especially do we hear that in the description of manufacturing processes the really important things are not there, not so much because they are unknown to the writer as because they cannot be divulged. Such is the hypercriticism by which the dictionary writer is always assailed.

Sir Edward Thorpe's habits of mind and character qualified him in an exceptional degree for the task of writing a dictionary. His long experience and wide interest in the science enabled him to find the writers that were wanted; his acute sense of order, his instant punctuality, and the nicety of his literary skill all combined to give him an equipment for the work in hand such as comes to very few chemists. The reality of his editing is well known to contributors. A sufficient example may be quoted where in the revision of an article a contributor desired to introduce a slightly better and larger diagram. Thorpe assented, in his own clear handwriting, by return of post, remarking that

the change would incur a slight deletion in the text—47 (or some such prime number) of words. The suggested 47 verbal victims were accordingly marked in red ink on the text enclosed. To have done what Thorpe did and as he did it, in the remoteness of South Devon in years past the allotted span, is surely something very notable—something that cannot be contemplated without a profound sense of admiration and respect.

The concluding volume now before us was, we are told, well on its way at the time of Sir Edward Thorpe's death. For its completion there was, fortunately, in Dr. Foster Morley another veteran of the select body of dictionary makers. We are sure Sir Edward Thorpe could not have wished for a better substitute, and Dr. Morley deserves our gratitude. The same is true of Miss Micklethwait, who has accomplished the task of making a good index to the whole work.

The review of a dictionary by an ordinary mortal cannot very well go beyond generalities. It can certainly be said that the present volume contains some very interesting articles. The alphabetical arrangement does not carry with it any descending scale of interest in the topics. Even under W we have water, whiskey and wine. A careful perusal of some of the articles on subjects with which the reviewer is least ill-acquainted fully warrants him in saying that the high standard of former volumes is fully maintained. There are, of course, omissions, as, for example, in the case of water, where there is no mention of hydrone or hydronol. This may, perhaps, cause a cyclonic centre to develop over S.E. London, moving in due, or undue, course towards Finsbury Square. But on matters of fact no fault is likely to be found.

Thorpe's Dictionary of Applied Chemistry had its origin in the great work of Henry Watts, first published in 1875, which had become the standard dictionary for the whole range of chemical science. There existed, alongside of Watts', Muspratt's "Chemistry, Theoretical Practical, and Analytical," and Dr. Üre's Dictionary of Arts, Manufactures and Mines. All three works had become antiquated beyond the stage of easy revision, and on the death of Watts, who had actually begun upon the task, changes of plan were made whereby the publishers decided to bring out a new edition of Watts in four volumes, under the editorship of Dr. Foster Morley and Mr. Pattison Muir. The first volume appeared in 1888 and the last in 1894. At the same time it was decided to bring out a dictionary of applied chemistry in three volumes under the editorship of Sir Edward Thorpe. The first volume appeared in 1890, and the last in 1893. The work at once found wide acceptance. A new edition was commenced in 1912 in five volumes, and completed in November, 1913. The publication of the third edition in seven volumes was commenced in 1921, and has now been completed. The volumes average 750 pages, containing about 920,000 words per volume. In 15½ years (March, 1912—October, 1927) twelve volumes have been published (i.e., at the average rate of one in fifteen months), containing over eleven million words. This shows the labour needed by editor, writers, and

publishers to keep pace with the unprecedented advance in applied chemistry in the last fifteen years. In that period over 46,000 volumes of the Dictionary have been sold.

Such is the history of the work which we now see completed in its third edition. The writer of this notice rises from his little task with grateful recollections. He was in early life presented to Henry Watts, affectionately named by Roscoe "the dictionary," and had possessed the work since 1874. In Thorpe he had an early benefactor and a life-long friend, a man from whom there was much to learn both in work and ways, a chemist who unswervingly trod the true path of science.

ARTHUR SMITHIELLS

A COMPREHENSIVE TREATISE ON INORGANIC AND THEORETICAL CHEMISTRY. By J. W. MELLOR, D.Sc. Vol. VII. Ti, Zr, Hf, Th, Ge, Sn, Pb, Inert Gases. Pp. x + 977. London: Longmans, Green & Co., Ltd., 1927. Price 68s.

In this volume, the latest addition to his monumental text book, Dr. Mellor deals with titanium, zirconium, hafnium, thorium, germanium, tin, lead and the "inert gases." The book is divided into eight chapters: one chapter being devoted to each of the above-named elements the actual spacing being as follows: Ti, 96 pages; Zr, 67 pages; Hf, 7 pages; Th, 79 pages; Ge, 21 pages; Sn, 208 pages; Pb, 401 pages, whilst the "inert gases" occupy 62 pages. The method of treatment in each chapter is similar to that which the author has adopted in the earlier volumes of the series, and which experience has shown to be highly satisfactory.

The task of the reviewer of such a work is not easy if justice is to be done to the author, and as the present volume is too heavy to be handled in comfort for arm-chair fireside review, the method adopted has been to put the work to practical test in a laboratory especially concerned with at least two of the important elements dealt with by the author. It can be said that after a period of some weeks exposure to this somewhat critical test, the work has stood the trial in a most satisfactory manner, and no higher tribute can be paid than this. It must not be understood that errors have not been detected or that portions have not been found wanting, but it can be said that such faults as have become apparent are trivial when contrasted with the vast scope of the work, and tend only to bring out in greater relief the bold lines on which Dr. Mellor has conceived his work. The imperfections which close examination has revealed may be likened to rough chisel marks often apparent on large pieces of statuary—visible only at close quarters and in no way detracting from the general scheme to adopt a simile which recently appeared in a literary contemporary.

The wide range of literature covered by the author has compelled him to adopt a staccato style of expression, although it is of interest to note that the Mellor of "Modern Inorganic Chemistry" has refused to act as a mere recorder of published literature, and at times asserts himself, as is evidenced by the occasional appearance of passages written in the attractive narrative and critical style which is peculiarly his own. It is not to be expected that the much-condensed summaries will

receive universal approval, and many authors will feel sore when they find some lengthy thesis summed in three or four words. Such compression is, however, inevitable, and as compensation the author has supplied complete references so that the original work can be consulted.

The chapters on titanium, zirconium, and thorium illustrate the rapid developments which are taking place in connexion with these elements and the growing industrial importance of their compounds, whilst the chapters on tin and lead form in themselves a complete reference work on the subject. From the industrial point of view it is a little disappointing that the sketches are wholly diagrammatic in character, and that modern processes are frequently dismissed with less consideration than the older obsolete processes. The important alloys into which tin and lead enter receive much attention, but it is impossible in this connexion, as in many others, for the author to evaluate the contradictory statements which exist in literature.

Close inspection reveals more evidence of hasty proof reading than is apparent on casual examination, and it would seem that many of these errors would have been avoided had the author been able to have his various chapters read over by collaborators having special knowledge of the particular element under discussion: future editions would benefit by the adoption of some such method.

The present volume is a worthy successor of the earlier volumes and it is likely long to remain the standard English reference work of its kind.

Dr. Mellor is to be congratulated on having enriched chemical literature, and it is hoped that the criticisms which have been made will prove of some use in the preparation of subsequent editions. The book is full value for money—the references alone making it a sound investment for even those only remotely concerned with the materials included within the scope of the work.

C. A. KLEIN

CHEMICAL REVIEWS, Volume III, February, 1927. Number 4. Pp. 322—445. Published quarterly for the American Chemical Society. Baltimore, U.S.A.: The Williams and Wilkins Company; London: Baillière, Tindall and Cox, 1927. Price 23s. 6d., post free, per annum.

The final part of Vol. III of "Chemical Reviews" contains five papers on "The use of X-rays for the discovery of new elements," "The present status of turbidity measurements," "The interaction of electrolytes with non-electrolytes," "Immunologically specific polysaccharides" and "The principal chemical researches on cod liver oil." These papers illustrate the wide diversity of subjects covered by the reviews, since, whilst everyone will be interested in the first paper, which was written in response to a special request by the editor, it may very well happen that the mathematical symbols of the second and third papers will be quite unintelligible to organic chemists or biochemists, who will turn first to the two final papers of the volume. This mutual incomprehensibility (notice the appropriateness of the 8-syllable word) is one of the bewildering features of modern chemistry which it is wise to recognise, but

unwise to encourage. In the present instance it appears that the editors may have been too lenient in allowing the contributors to write for a small fraction only of the chemical world, since the articles obviously fail (where the Annual Reports of the Chemical Society succeed) in presenting material which can be read with understanding by the average chemist. If, as is apparently the case, the articles are contributed gratuitously, it is easy to understand the origin of this failure, since a busy worker, who can afford to spend time in propagating the results of his own specialised investigations, can scarcely be expected to devote his energies to a more popular (and therefore much more difficult) exposition of progress in a wider field. If, therefore, the reviews are to maintain their usefulness, it seems essential that funds should be placed at the disposal of the editors which would enable them to invite contributions on topics which are selected on account of their interest to the general reader, as well as on account of their more special interest to the contributor.

COLLECTED PAPERS OF SIR JAMES DEWAR. Edited by LADY DEWAR, with the assistance of J. D. HAMILTON DICKSON, H. M. ROSS and E. C. SCOTT DICKSON. With two supplementary papers not heretofore published, and an appendix and indexes. Vol. I. Pp. xxii + 674. Vol. II. Pp. ix + 675—1489. Cambridge: The University Press, 1927. Price, for the two volumes, £4 4s.

Students of chemistry and physics will welcome with warm appreciation these volumes in which the scientific papers of Sir James Dewar are republished in collected form. The record which they present cannot fail to be a source of inspiration to younger workers, and the wonderful versatility of the author is manifested by the wide range of subjects the knowledge of which has been enriched by his work.

Although he will always be chiefly known for his experimental investigations lying in the borderland between physics and chemistry, several of his earlier papers deal with carbon compounds and are of no little interest to the student of the earlier history of organic chemistry. To his first paper (1867) "On the oxidation of phenyl alcohol (phenol)" he appends the description of "a simple mechanical arrangement to illustrate structure in the nonsaturated hydrocarbons," the carbon atom being represented by a pair of thin metallic bars loosely clamped together at their middle points. With these models he shows seven different methods of representing the compound C_6H_6 , and the sixth of these is the benzene formula with the *para*-bond now associated with his name. In 1868 he exhibited to the British Association at Norwich the model devised by Kekulé to give a fuller representation of the structure of carbon compounds than could be achieved with plane formulæ. "Carbon, with its four atomicities, [was] represented by a small sphere with four equal wire arms joining the centre of the sphere with the angles of an imaginary tetrahedron." This was six years before the enunciation of the theory of the asymmetric carbon atom by van't Hoff and Le Bel. Also in a paper communicated to the Royal Society of Edinburgh in 1870 he proposed the formula now generally adopted for

pyridine, the same suggestion having been made about the same time by Körner, his fellow-student under Kekulé at Ghent.

The breadth of his interests is further shown by his biological papers with Macfadyen, and the experiments carried out with Macfadyen on the effects of extreme cold on bacteria; the long series of papers presenting the account of the spectroscopic work conducted with Prof. Liveing (which are printed in title only as they have already been published in collected form) reveals yet another side of his activities.

His memory, however, will always be chiefly associated with his brilliant investigations in the field of low temperatures which formed by far the greater part of his scientific work, and which are so extensive as to render any detailed reference to them here impossible. It is a boon to have the memoirs in which these are described gathered together in connected form, so that the reader can more easily trace the manner in which each achievement paved the way for the next: liquid air, liquid hydrogen, solid oxygen, solid hydrogen, and those devices, the vacuum flask and the charcoal vacuum, without which some of the most important physical investigations of recent times could not have been carried out. One has throughout the impression that his results were obtained with the simplest possible means, and over all his work there is the mark of experimental genius and of an intellect extraordinarily acute.

The book has been admirably printed by the Cambridge University Press, and its two fine volumes form a fitting monument to the great investigator whose achievements they record.

W. H. M.

A TEXT-BOOK OF INORGANIC CHEMISTRY. By A. F. HOLLEMAN, D.Sc., F.R.S.E. Seventh English revised edition, issued in co-operation with H. C. Cooper. Pp. x + 541. New York: John Wiley & Sons, Inc.; London: Chapman & Hall, Ltd., 1927. Price 17s.6d.

The reviewer need not recommend Prof. Holleman's book; it has already recommended itself to the extent of 32,000 copies in a space of 26 years. Since the appearance of the sixth edition, in 1921, it has filled out a little here and there without much altering its familiar general appearance. Certain sections, for instance those dealing with colloids, atomic structure, etc., have been rewritten, and other portions of the text have also been subjected to revision. The stated composition of "English shillings" is flattering, but no longer correct.

A. A. E.

CHEMISTRY. By PERCY E. SPIELMANN, Ph.D. Pp. ii + 80. Benn's Sixpenny Library, No. 104. London: Ernest Benn, Ltd., 1927. Price 6d.

It is a commonplace that the non-scientific public is profoundly ignorant of the principles of chemistry; it is equally true that there is little reason why everybody should be a chemist. Nevertheless, a bird's-eye view of the nature and scope of a science is bound to be of considerable interest, and some profit, to any normally inquisitive, broadly-educated person. When a demand exists for information, such as is given in this little book,

as it properly should and undoubtedly does (even were it only to provide a horizon for the better perspective of the chemical "stories" which from time to time appear in the daily press), there is every reason why it ought to be met in an authoritative and attractive manner. The task of presenting in simple, yet sufficiently accurate, terms a statement embodying the development and fundamental principles of chemistry, its application to human affairs, its outstanding successes and its major problems, and the direction of its progress is never an easy one. In the present instance it has been well and truly performed. In addition to its value as a kind of "visiting card" for the science of chemistry, the book affords information concerning the profession which aspirants thereto, as well as their parents, should find useful. The reviewer, at any rate, considers it a remarkably good sixpennyworth!

A. A. E.

OUTLINES OF EXPERIMENTAL CHEMISTRY. By E. B. LUDLAM, D.Sc., M.A., F.R.S.E., and H. PRESTON, A.R.C.Sc. Book I, pp. xv + 64 + viii; Book II, pp. viii + 65-148 + viii. Third edition. London: Edward Arnold & Co., 1927. Price, I, 2s.; II, 2s. 6d.

This book, which is stated to be based on the experience gained from 16 years' use of the former edition, presents a scheme which endeavours to steer a middle course between the instructional and the research methods of teaching chemistry in schools. Part I, intended for the lowest forms which are doing practical work only, and Part II, covering the practical work required for the various School Certificate Examinations, together form Book I, whilst Part III, for pupils taking the Higher Certificate, or Inter B.Sc. Examination, and Part IV, dealing with qualitative analysis, are published together as Book II. Questions are freely interpolated so as to avoid the danger of inaccurate conclusions being reached as a result of an experiment, and to provide a stimulus to individual thought. The proof of the pudding is, of course, in the eating, but should the course fail to achieve marked success with pupils of average intelligence, appearances will have been very deceptive.

A SURVEY OF AMERICAN CHEMISTRY. Volume I. Edited by W. J. HALE and C. J. WEST. Pp. 257. New York: Chemical Catalog Co., Inc., 1927. Price \$2.00.

The limitation (in scope, and, therefore, in usefulness) of a survey such as this is all too obvious to chemists, who are accustomed to assess the progress of any branch of their science without reference to political or geographical frontiers. The survey deals essentially with investigations in pure and applied chemistry which, between July 1, 1925, and July 1, 1926, were described in publications originating in the United States of America, and with processes patented in that country. There are occasional references to work published elsewhere, but one or two chapters, particularly that on cellulose, are distinguished by a somewhat wider vision. Whilst the utility of the compilation is still further depressed by the omission of an index, its interest, and in particular its stimulus, remain unaffected. The thirty-four chapters deal authoritatively with almost

every phase of the subject, and include definite indications of the lines along which further progress is probable or desirable. The chapter on co-operative research between industries and universities merits special attention.

ORGANIC CHEMISTRY. Designed for Students in Applied Biological Fields; Agriculture, Home Economics, Medicine, Dental Science, Pharmacy and Veterinary Medicine. By FRANK E. RICE, Ph.D. International Chemical Series, edited by H. P. Talbot, Ph.D., Sc.D. Pp. ix + 303. London: McGraw-Hill Publishing Co., Ltd., 1927. Price 12s. 6d.

This book has been written for the benefit of those who, like physicians, agriculturalists and pharmacists, require some knowledge of organic chemistry as it bears upon their respective subjects, without studying it in such detail as is necessary for the professional chemist. From its special point of view the book may be pronounced very satisfactory. It is not so long as to be wearisome to those who do not require much detail. It is also clearly written, and the condensation of the purely chemical part and the selection of special subjects for mention seems to be happily accomplished. The general get-up of the book is excellent, the shape is satisfactory, the paper is good, the printing is admirable, and the binding is attractive. The text is illustrated with a number of half-tone blocks, some of which are appropriate and useful, such as, for example, Fig. 13, showing the production of rubber from a tree; Fig. 22, representing calf skins before and after tanning; and Fig. 25, indicating how gull nuts are produced. Several others, however, hardly justify the space they occupy; Fig. 8, for example, represents a 12,000-gal. tank for the purpose of storing alcohol, but which, for all that can be gathered from the picture, might be storing any other liquid. Similarly, in Fig. 18, it seems doubtful whether a scheme illustrating the production of cinematographic film gains anything from the pictures of a number of bottles stated to contain certain ingredients. But this is perhaps captious criticism.

The book has been brought well up-to-date without being thereby rendered unintelligible. An early chapter deals with the structure of organic compounds from the octet point of view, and modern methods of preparation are usually mentioned. At the end of each chapter a few topics are suggested for further study. The book, considering the limitations set upon it from the beginning, should prove distinctly useful.

T. S. PATTERSON

ELECTRO-ORGANIC CHEMISTRY. By C. J. BROCKMAN. Pp. xi + 381. New York: John Wiley & Sons (Inc.); London: Chapman & Hall, Ltd., 1926. Price 25s.

Professor Brockman has succeeded in collecting together a very considerable amount of material on processes of electrolytic oxidation and electrolytic reduction. Already, in 1908, Dr. Brand published a monograph nearly three hundred pages long restricted to consideration of the electrochemical reduction of nitro-compounds alone, thus it is not difficult to imagine that contemplation of a book on electro-organic chemistry is a somewhat arduous undertaking. The book is naturally

divided into two divisions dealing with anodic and cathodic processes respectively. Apart from a few "Americanisms" such as on p. 197, "The chemical acumen of Haber asserted itself in the solving of this problem. He figured that if the nitrosobenzene—" and a few statements which require a certain mental effort in order to understand what is actually intended, such as on p. 276, "There is practically no addition of hydrogen to an unsaturated acid on a smooth platinum, and slightly less reaction at a smooth copper or lead cathode," the statements in the book are clearly expressed. Attention is drawn to the industrial importance of many of the processes and the technical value of reactions which might be effected by electrolytic methods if only the conditions of reaction were known.

It is a pity that Dr. Brockman has not included in the volume any serious theoretical considerations. It is certainly true that we know very little about this subject, but even this should be pointed out so as to encourage research into the why and wherefore of electrolytic oxidation and reduction. Whilst the method of graded potentials in oxidation processes and the regulation of reduction by the choice of metals with different hydrogen overpotentials are standard methods of operation in these electrolytic processes, we still do not know how these processes actually operate—why, for example, the oxidation rates of the fatty acids are all different, or whether the mechanism of reduction of a double bond or nitro-group can be considered analogous to the well-known reversible quinone-hydroquinone systems. To those who are interested in these matters numerous experiments are detailed in this volume, extension and repetition of which cannot fail to provide material from which interesting conclusions could be drawn. The book is replete with references and well printed.

E. K. RIDEAL

STATISTICAL MECHANICS WITH APPLICATIONS TO PHYSICS AND CHEMISTRY. By R. C. TOLMAN, Ph.D. American Chemical Society Monograph Series. Pp. 334. New York: The Chemical Catalog Company, Inc., 1927. Price \$7.00.

Present-day mathematical physics is a matter of statistical theory. The laws of nature are essentially statistical in character. Thus the theory of spectra presents us with a series of electronic orbits of greater or less probability, and the intensities of spectral lines are determined by the respective statistical probabilities of electronic excursions between these orbits. To take a more homely example. The difference of pressure between the upper and lower faces of a brick at rest in still air is not constant and equal to the theoretical head, but is a statistical effect, the actual difference of pressure varying between wide limits. Calculation shows that for a single instant in $(10^{10})^{10}$ years the excess pressure on the lower face may be sufficient to sustain the weight of the brick! Were our perception of minute intervals of time sufficiently refined, this striking phenomenon might be observed. We would direct the attention of levitators to the theory.

In the present work the theory of statistical mechanics is treated in a logical fashion, special attention being given to the physical implication of the concepts employed

rather than to mathematical subtleties. Considerable mathematical knowledge—about up to the standard of an honours degree—is required of the reader. Sections are devoted to classical statistical mechanics, the quantum theory, application to molecular processes, the rate of physical-chemical change. All parts of the subject are well treated, and the whole forms an extremely valuable survey of knowledge available upon the subject. Original contributions by the author comprise a new treatment of the principle of microscopic reversibility, the equipartition law, and the method of introducing the quantum theory.

The book is well produced and is well printed on good paper. There is not a single illustration. Adequate name and subject indexes are provided. The price cannot be considered excessive. We commend the work to all equipped with the necessary mathematical knowledge.

J. S. G. THOMAS

- (1) **ATOMIC THEORY. AN ELEMENTARY EXPOSITION.** By A. HAAS, Ph.D., translated by T. VERSCHOYLE, M.C., Ph.D. Pp. xiv+222. London: Constable & Co., 1927. 10s. 6d.
- (2) **THE STRUCTURE OF THE ATOM.** By PROF. E. N. DA C. ANDRADE, D.Sc., Ph.D. Third edition, revised and enlarged. Pp xviii + 750. London: G. Bell & Sons, Ltd., 1927. 30s.
- (3) **THE MECHANICS OF THE ATOM.** By PROF. M. BORN. Translated by J. W. FISHER, B.Sc., Ph.D., and revised by D. R. HARTREE, Ph.D. International Text-Books of Exact Science, edited by Prof. E. N. Da C. Andrade. Pp. xvi+317. London: G. Bell & Sons, Ltd., 1927. 18s.

The above books are placed in order of increasing difficulty. All three deal with the development of atomic theory from the point of view of the physicist.

(1).—Professor Haas gives an elementary account of the theory of the hydrogen atom, Röntgen rays, the theory of the elements, and the general theory of spectra and of atomic structure. The systematic treatment of the subject makes the book an excellent student's textbook, and one that should appeal to those who, without possessing any great knowledge of science, wish to learn something of atomic theory.

(2).—The first edition of Prof. Andrade's book was reviewed in this JOURNAL in 1923 (p. 992). The present edition, however, fulfils its claim to be a new book because the text is largely rewritten, and now extends to more than double the number of pages of the previous editions, with a corresponding increase in the number of diagrams and plates. New chapters have been written dealing with multiplets and the anomalous Zeeman effect, and with quantum theory and wave theory: and new discussions appear on critical potentials, Saha's theory of ionisation, and Born and Landé's work on the elasticity of solids.

Prof. Andrade is to be congratulated on his success in the difficult task of keeping his book up to date: his subject matter is largely in a state of flux, and he has performed a very real service to all those interested in atomic structure by writing, in his attractive style, such an authoritative book.

(3).—Prof. Born attempts a deductive treatment of

atomic theory by referring the facts of atomic physics to their underlying mechanical principles. The book can be read with profit only by one who is well equipped mathematically, and who is already familiar with the subject of atomic physics, say to the extent of having mastered Prof. Andrade's book.

JOHN A. CRANSTON

ELEMENTARY PRACTICAL PHYSICAL CHEMISTRY. By J. F. SPENCER, D.Sc., Ph.D. Pp. viii + 263. London: G. Bell and Sons, Ltd., 1927. Price 5s.

In arranging a course of practical instruction in physical chemistry, the choice of experiments is limited by the cost of the apparatus which must be provided, and by the fact that each experiment must be such as can be completed within a specified period of time. If such instruction is attempted in schools, these difficulties become particularly prominent, and so-called practical work is apt to degenerate into watching demonstration experiments performed by the teacher. In the present volume Dr. Spencer sets out to show how much useful experimental work can actually be done by elementary students in spite of the limitations of time and money. He describes over a hundred experiments, the majority of which require only simple and relatively inexpensive apparatus and can be carried out by students whose work in the laboratory is limited to periods of an hour and a half. In order to cover a wide range of subjects, the author has not hesitated to include some purely qualitative experiments to illustrate important physico-chemical principles. This is a sound plan, for so far there has been a tendency to exclude such experiments from a physical chemistry course without finding a place for them in other courses, with the result that important subjects such as osmotic pressure, electrolysis, and the whole of colloid chemistry have often been entirely neglected on the practical side. Experimental details are clearly described and the introductory matter which precedes each group of experiments is sufficient to draw attention to the principles involved without attempting to usurp the function of a theoretical textbook. The diagrams are well drawn and are adequate for an easy understanding of the text. The use of the terms "sulphur" and "nitrogen" cannot be commended, and writing equations relating to gas volumes in terms of temperature on the Centigrade scale instead of on the absolute scale merely makes them look complicated without having any corresponding advantage. The book can be recommended not only as a manual from which experiments suitable for school courses can be selected, but also as the basis of the first half of a systematic degree course in practical physical chemistry.

H. J. T. ELLINGHAM

THE INDUSTRIAL CHEMISTRY OF THE FATS AND WAXES. By PROF. T. P. HILDITCH, D.Sc. With an introduction by Dr. E. F. ARMSTRONG, LL.D., F.R.S. Industrial Chemistry Series, edited by E. de Barry Barnett. Pp. xvi + 461. London: Baillière, Tindall & Cox, 1927. Price 18s.

Prof. Hilditch's scientific attainments, his long and successful experience in the Crossfield laboratories and works at Warrington, culminating in his appropriate appointment some two years ago to the Campbell Brown

Chair of Industrial Chemistry at Liverpool University, have equipped him in a unique manner for the task of writing the volume now under review, and he is to be congratulated on the general level of excellence he has reached in it. The scope of the book is quite good, and due balance and proportion have been maintained in allotting the amount of space devoted to each of the various sections into which the book is divided. An agreeable feature of the book is the absence of laboured details respecting out-of-date chemical ideas, technically valueless or commercially impossible manufacturing operations or matters having now only historical interest.

The chemical aspect of the subject is well treated, all the more recent advances, both purely chemical and physico-chemical, being considered, and only such attention is paid to the details of analysis and identification as is necessary for a proper understanding of the subject. The distribution and output in nature of the fats and waxes is first considered, then a necessarily lengthy account of the more common fats and waxes follows, after which the author proceeds to an account of the industrial methods of extraction and refining of fats. Fat-hydrogenation, fat-splitting or hydrolysis, the consideration of butter margarine, hard, and edible fats generally receive due consideration, after which the author deals in turn with the soap industry and the physico-chemical aspect of soap boiling, the manufacture of candles, and the production of glycerin, concluding with a number of chapters dealing less exhaustively with the "drying" of fatty oils, fatty oils and waxes in the paint, varnish and linoleum industries, together with a brief account of sulphonated oils, wool oils and fatty lubricants. Throughout one is conscious of the author's very close acquaintance with the raw materials and the operations involved in the industries he has described.

Prof. Hilditch is not too happy about the use of the word "oil" as applied to fatty oils, and in spite of his efforts to the contrary the word obtrudes throughout the book, and he seems no more able to avoid its use than the unfortunate Mr. Dick was able to avoid references to King Charles's head. The expression "fatty oil" which seems preferable to "liquid fat," avoids any of the misunderstanding which may occur through the use of the word "oil" alone.

Amongst points calling for criticism one may mention the statement that the strength of the caustic soda solution in the neutralisation of fatty oils is 60° Tw (p. 196): surely this is exceptional, the usual range being 14° to 34° Tw according to the nature and quality of the oil. Speaking of the Bolton and Lush continuous process of fat-hydrogenation, the author says, "Whilst it is hoped that this method will also avoid filtration of the hardened fat". It is unfortunate that before committing himself to this expression of opinion he did not trouble to enquire, when he would have found experience triumphant over hope. At no time has recourse to filtration been necessary with either of the two plants operating this process in England, and one of the plants has been in operation for five years. The author's estimate (p. 351) of the British production of crude glycerin (80% glycerol) as about 25,000—30,000 tons per annum is indeed on a very generous scale: 15,000 tons is an estimate much closer to exactitude.

Prof. Hilditch has given us a very readable and extremely useful book, which has been carefully indexed, though it is a great pity that numbered references have not been given in the text: the growing habit of grouping together lists of original papers and patent references at the end of a long section without clear numerical references in the text is one to be deplored, and if this growing practice becomes general such lists will be almost useless to the reader. Dr. E. F. Armstrong, in a brief though appropriate introduction, gives the book his blessing.

H. M. LANGTON

GOTTLÖB'S TECHNOLOGY OF RUBBER. Authorised English edition, translated and revised from the German edition of 1925 by JOSEPH L. ROSENBAUM, M.Sc., M.I.Chem.E. Pp. xvi + 350. London: Maclaren & Sons, Ltd., 1927. Price 42s.

The first edition of the late Kurt Gottlob's "Technologie der Kautschukwaren" appeared during the war (1915), and for this reason seems to have passed unnoticed in this country. When the second (German) edition was submitted to the reviewer he formed the opinion that, particularly in view of the paucity of modern literature dealing with rubber manufacture, it was a work to be cordially welcomed, and certainly merited translation. Messrs. Maclaren are fortunate in having found in the person of Mr. Rosenbaum a translator who not only possesses the technical qualifications necessary for this class of work, but is capable of rendering the foreign idiom in corresponding and not literal English. The work, which contains numerous illustrations and diagrams, is divided into two parts, namely: (1) on "The general technology of rubber"; and (2) covering "Selected chapters on the special technology of rubber goods." In both sections a wise process of devolution has been applied, various subjects being dealt with by specialists under the general editorship of or in collaboration with the author. Thus the chapters on "The examination of raw rubber" and the "Chemical analysis of vulcanized rubber" are by Prof. E. Kindscher; the "Mechanical testing of soft rubber" is written by Prof. A. Schob; Dr. Schmelkes is responsible for "Accelerators"; and K. Miksch in association with Dr. Gottlob cover "Rubber heels and soles" and "Proofed cloth." Other special branches of manufacture dealt with and regarding which the literature has hitherto been meagre are: "Rubber toys," by Dr. Dorogi; "Manufacture of rubber shoes," by E. Herbst, and "Dipped goods," by E. Herbst and the author. Dr. Gottlob's scientific and technical qualifications were of such a high order that a work of outstanding merit was to be expected from him. It may be fairly said that anticipations in this regard have been realised, and that the author's objects in writing the book have been attained. These objects, as stated in the translator's preface, are as follows: "In the first place the work is for the scientifically educated technologist who is desirous of entering the rubber industry. To such a man it presents in concise and systematic form the underlying scientific bases of the industry, and also the general factory operations, emphasising these latter by a series of specially chosen examples. Secondly, it is to meet the needs of the man who is already engaged in the rubber industry, but who is

desirous of becoming acquainted with the scientific foundations of his daily work and with the results of the most recent investigations on the chemical and physical properties of the principal raw material. Lastly, the book is offered in the hope that it will serve the needs of the vast army of people who, though neither rubber manufacturers nor rubber scientists themselves, have a direct interest in the material as consumers of, or dealers in, rubber or manufactured rubber goods." The work may be regarded as "up-to-date" inasmuch as the author searched the literature up to the middle of 1924, and the translator has drawn attention, in his preface, to more recent developments. With regard to the illustrations, representations of English and American machinery have wisely been substituted for the Continental types depicted in the original wherever this was practicable. Gottlob's "Technology of rubber," should certainly find a place in the library of all those interested in rubber.

PHILIP SCHIDROWITZ

TEXTILE BLEACHING, DYEING, PRINTING AND FINISHING MACHINERY. By A. J. HALL, B.Sc. Pp. xvi + 320. London: Ernest Benn, Ltd., 1926. Price 50s.

This book is the first, as far as the reviewer is aware, in which an attempt has been made to describe the construction and performance of machinery employed to-day for bleaching, preparing, dyeing, printing and finishing textile fabrics, yarns and fibres. The book appears to be mainly concerned with the cotton industry, and in the reviewer's opinion it would have been better to have confined the work to this branch only. It is perhaps advisable to include in literature of this kind the technical terms that are chiefly used in the trade. For example, p. 18 deals with sewing for the production of a tubular fabric for certain operations; this is known generally as "bagging." The section on indigo dyeing machines does not mention the hawking machine, which is the main machine used for the dyeing of woollen and worsted fabrics with indigo. The term "oxidant" (p. 98) is used by the author in dealing with the production of aniline black; it is not a nice term. In the section dealing with mercerisation (p. 104), a short statement is given of the heat of reaction of caustic soda and cellulose. This is very scrappy, and unless given more fully, from both theoretical and practical views, is of practically no value. Many machines are described for the dyeing of loose fibres and yarn, but there is no mention of the Obermaier and the Klauder Weldon machines, which were the first of the percolation and rotary types of machines for these purposes, and which are still largely employed in the industry; others could be mentioned that are employed for the dyeing of wool. The term skein is used in this book in connexion with machines for treating yarn in hank or skein form. The term skein is mainly used for silk and artificial silk, and the term yarn mainly for cotton, woollen and worsted material. Such valuable machines as the Schlumpf and the Hunsong are not mentioned in the section on yarn dyeing.

No reference is made to the warp dyeing or mercerising machine, in spite of the fact that mercerisation is more uniform in warp than in hank mercerisation, and also that the majority of dyed cotton warps are dyed in rope

form. The book is well provided with splendid illustrations, and may fill a gap in textile literature. A book of this kind would have been much more valuable if the author had considered the demands made upon the machines from a theoretical as well as a practical standpoint. The technologist would then refer to the book to a far greater extent than he does to manufacturers' catalogues.

L. L. LLOYD

TITANIUM—WITH SPECIAL REFERENCE TO THE ANALYSIS OF TITANIFEROUS SUBSTANCES. By WILLIAM M. THORNTON, JNR. American Chemical Society Monograph Series. Pp. 262. New York: The Chemical Catalog Co., Inc., 1927. Price \$5.00.

This book is a welcome addition to the scanty literature dealing with titanium. The main title, "Titanium," is likely to prove misleading, for over two-thirds of the book is devoted to matter falling under the sub-title; thus, the book is divided into four parts. Part I, Introductory, pages 21–82, being divided into four chapters: I, "The discovery of titanium," II, "The occurrence of titanium in nature," III, "The general chemistry of titanium," IV, "The industrial applications of titanium and its compounds." Part II, "The detection and estimation of titanium in its various associations," occupies pages 83–222, containing four chapters, whilst Part III, "Reagents," covering five pages, consists of Chapter X concerned with "the preparation of certain reagents," and Part IV is a collection of notes and references occupying some 26 pages.

Notwithstanding the small compass into which the author has compressed the material included in Part I, he has compiled a most interesting and valuable account of an element the compounds of which are slowly assuming technical importance. Titanium is no longer regarded as a "rare" element—indeed, as the author shows, ". . . titanium is nearly one third as plentiful in nature as magnesium, and the ratio of titanium to phosphorus and sulfur is more than five to one and nine to one respectively, in spite of the fact that these three elements are usually considered common."

The author stresses the ubiquitous character of the element and its ready accessibility, and makes it clear that up to the present the technical utilisation of titanium compounds has been comparatively insignificant. The present uses of titanium compounds are stated to be (in descending order of importance), pigments, alloys in metallurgy, dyes, mordants, bleaching agents etc., refractory materials, smoke screens, incandescent media for lighting purposes, cement, gem stones, abrasives, catalysts, ink, medicinal preparations, nitrogen fixation, phosphorus pentoxide, and applications in pure science.

In the analytical sections of the book the author has provided a mine of useful information for those who are concerned with titanium and its compounds, and who are familiar with the many difficulties attending the analysis of certain materials which contain this element.

The work will prove invaluable to all connected, even in a remote way, with titanium or its compounds, for it is the only compilation of its kind, and with the growing technical importance of these materials, will become a standard reference work which should stimulate investiga-

tions into the possible development of a most interesting but hitherto only partially explored field of chemical industry.

In subsequent editions the author might, with advantage, endeavour to preserve a more even balance between the technical and analytical sections of his work, for the latter is somewhat heavy and loaded with unnecessary detail, e.g., the sketches on pages 155 and 159 of a specific gravity apparatus, a pycnometer, a steel mortar, and an agate mortar do not add to the value of the work. These are but minor blemishes in a book which can be thoroughly recommended, and the author is to be congratulated on his work. Particularly valuable are the complete notes and references forming Part IV.

C. A. KLEIN

OIL AND RETORTABLE MATERIALS. A HANDBOOK ON THE UTILISATION OF COAL, TORBANITE, CANNEL AND OIL SHALE. By GEORGE W. HALSE, B.Sc. Pp. vi + 146. London: Charles Griffin & Co., Ltd., 1927. Price 7s. 6d.

So frequently have we read, in the daily as well as the technical press, of the folly of polluting the atmosphere with smoke, that our content as we sit by our coal fires must be disturbed with misgivings. Yet many of us accept our petrol from the ubiquitous pump without realising how great a national problem the supply of fuel oil now presents, and how intimately connected it is with the reasonable use of coal. The author of this book has endeavoured to describe, in a manner which will interest the non-technical mind, the essentials of the various processes for the manufacture of liquid fuels, so that the reader may be in a position to gauge correctly many of the reports which are made from time to time with reference to new developments, and to view the situation in its true perspective. The developments of the coal and petroleum industries are briefly traced, and the manner in which oil has replaced coal, largely owing to the obvious advantages of an oil fuel, and the remarkable advances made in the design of the internal combustion engine, are described. Attention is directed to possible supplies of fuel oil obtainable by treating such materials as coal, shales, cannels, lignites and torbanites. The nature of these materials, and their mode of formation and occurrence, are separately discussed, and their correlation is attempted. The author then proceeds to describe, in an elementary manner, the meaning of carbonisation or "retorting," dealing with the desiderata of any particular system designed primarily for the production of oil by this means. In conclusion, the chemical characteristics of the distillates so obtained are detailed. Mention is also made of other processes for the production of liquid fuel, such, for example, as that of Bergius and of such fuels as "Synthol," power alcohol, and "Natalite."

To give a true presentation of scientific matter which appeals to an unscientific reader is admittedly difficult. In this direction the book would gain considerably by a more orderly arrangement of the material and an increased simplicity in the manner of its presentation. The illustrations are not particularly illuminating.

A. McCULLOCH

FERTILISERS AND SOIL IMPROVERS. By W. GARDNER. Pp. viii + 184. London: Crosby Lockwood & Son, 1927. Price 7s. 6d.

This book—by the author of "Chemical synonyms and trade names"—is one of the series of Lockwood's Manuals for Trade, Craft and Industry. Within recent years the difficulty of choosing a suitable fertiliser has become greater owing to the development of the fertiliser industry, the improved methods of production, the introduction of new products, and the increased knowledge of the part which the fertiliser plays in plant economy. The author wisely discusses "the soil and soil conditions" before dealing with the various manures. These are "considered under the heading of the constituent for which the particular material is valued" and short "general" notes, dealing with the function of nitrogen, phosphorus and potassium in plant nutrition, precede the descriptions of the simple substances containing these elements.

The classification adopted by the author is pleasing because of its simplicity and, although there is slight overlapping, yet this does not in any manner lessen its attractiveness. A useful chapter is included on "lime" in its various forms, and too great importance cannot be attached to this particular feature—the modern tendency in agricultural practice being to place more importance on liming in plant husbandry. From the chapters on the "valuation of manures" and the "application of fertilisers," a grower can obtain concise information regarding the fundamental principles of purchase and use.

Much valuable information has been brought together, and this compact book will aid farmers and gardeners and those who are studying agricultural or horticultural science. The volume can be recommended to anyone desirous of possessing a handy book of reference.

D. N. MCA.

NATURAL AND SYNTHETIC RESINS. By T. HEDLEY BARRY, ALAN A. DRUMMOND, M.Sc., and R. S. MORRELL, M.A., Ph.D. Oil and Colour Chemistry Monographs, edited by Dr. R. S. Morrell. Pp. vii + 196. London: Ernest Benn, Ltd., 1926. Price 21s.

This book deals with resins from the point of view of their use in the manufacture of varnishes. It consists essentially of a general summary of their properties together with brief descriptions of either their origin or their methods of preparation.

Numerous references are given to a fairly extensive literature, and the book should serve very well as a "key" to more detailed information. It must be confessed, however, that the book lacks originality, and shows little evidence of either critical thought or ripe experience having been brought to bear on the subject. It would appear to suffer from multiplicity of authorship; the story is not properly connected and not well balanced. Of 111 pages dealing with natural resins, one half of them are devoted to turpentine, rosin, and shellac. A chapter of five and a half pages, headed, "Spirit varnish resins" contains three pages on Malayan damar, only one and a half pages on all other varieties of that resin, and but one page on

spirit varnish resins other than damar. Only two pages are devoted to the interesting and important Japanese lacquer. The desirability of dealing with "Hardened rosin," in Part II of the book is debatable, but at all events one begrudges the space of twelve pages devoted to this subject, out of a total of 69 pages on synthetic resins. The two chapters on "Phenol-formaldehyde resins" and "Causes of resinification," respectively, are quite good and decidedly the best in the book.

Altogether, considering the high price charged and the undeniable qualifications of all three authors, we have to confess to some disappointment on reading this book.

THE ANALYSIS OF PIGMENTS, PAINTS AND VARNISHES. By Dr. J. J. FOX O.B.E., and T. H. BOWLES. Oil and Colour Chemistry Monographs, edited by Dr. R. S. Morrell. Pp. x + 179. London: Ernest Benn, Ltd., 1926. Price 16s.

It is probably correct to say that many people have felt the need for an authoritative and up-to-date British volume dealing with the chemical analysis of pigments, paints and varnishes. If this be so then it can undeniably be granted that this volume satisfactorily supplies that want. The fact must be emphasised, however, that the book is in no sense a complete guide to the technical evaluation of pigments, paints and varnishes, but deals almost solely with methods available for the chemical analysis of these materials.

The volume is not overburdened with alternative methods, but is confined in the main to those which the authors have found to be most suitable in the Government laboratories. Some of these methods have not been previously published.

The greater part of the book, viz., 123 pages, is devoted to the examination of individual pigments, and most of the latter seem to be adequately treated. The so-called "lake pigments," however, constitute a serious omission. Whilst there is something to be said for the authors' view that readers should refer to books on dyestuffs for methods of identifying the dyes used in lake pigments, yet we think the value of this book would have been considerably increased if this class of pigment had not been quite so summarily dismissed by them.

The two remaining chapters deal respectively with "the analysis of mixed paints" and "the examination of varnishes." Both chapters are all too short, but, with the exception perhaps of that part headed, "treatment of extracted pigment," it would not be fair to criticise the authors on that account.

THE SCIENCE OF ROADMAKING. By J. W. GREEN and C. N. RIDLEY, with a foreword by Prof. I. MASSON, M.B.E., D.Sc. Pp. xv + 138. London: Crosby Lockwood & Son, 1927. Price 10s. 6d.

The authors have endeavoured to cover a very large subject in the space of 138 pages. The 12 chapters into which the book is divided deal with (a) bitumens, asphalts, and bituminous sand carpets; (b) tar, pitch, and tarmacadam; (c) sett, woodblock, and india-rubber paving; and (d) cement, concrete, and concrete roads.

It is clear that in the limited compass of a book of this size all these sections cannot be covered completely, and the necessity for condensing the matter has led, in a few instances, to some vagueness. For instance, in the chapter on "Concrete roads" it is stated that "the strength of concrete varies directly with the percentage of cement in same." This may be true assuming all other factors are constant, but it may be misleading to an uninformed reader. The fact is that with an increase of cement the amount of water required for a workable mixture can be reduced, and the strength of the concrete increases as the ratio of water to cement decreases.

The authors have, however, succeeded in achieving their object, viz., "to throw some light in dark places on the materials and methods of road-making."

They state in the preface that, as far as they know, "this is the first British book on the subject." This statement, in the writer's opinion, is unfair to the many British authors who have written on the various aspects of road construction. The context to the above statement refers to the difference between British and American nomenclature. The section of the book on bitumen clearly defines the present British practice. The whole question of the nomenclature of bituminous substances, however, is in the melting pot. The subject was discussed at the fifth International Road Congress held in Milan and Rome, and more recently an International Committee on the Standardisation of Nomenclature and Tests of Road Materials has been sitting in Paris. In this country the question of tests and nomenclature of bituminous substances is occupying the attention of the Institution of Petroleum Technologists. When the divergent views held by the various countries are harmonised, some revision of this section of the book will probably be necessary.

A chapter is devoted to tests on tars and bitumen, but no reference is made to the fact that (a) methods of testing bitumen have been standardised by the Institution of Petroleum Technologists, and (b) the Ministry of Transport specification relating to the tar treatment of roads contains test methods for tar. This omission will, no doubt, be remedied in a subsequent edition.

The above criticism does not detract from the merit of the book, which is nicely arranged and well written, and should be in the hands of all who wish to take an intelligent interest in the construction of good roads.

R. G. B.

FOUR THOUSAND YEARS OF PHARMACY: AN OUTLINE OF PHARMACY AND THE ALLIED SCIENCES. By C. H. LAWALL, Ph.M., Ph.D., Sc.D., F.R.S.A. Pp. xv + 665. London: J. B. Lippincott Co., 1926. Price 25s.

The chief English work dealing with Prof. LaWall's subject is Wootton's "Chronicles of Pharmacy," published in 1910, and now unfortunately out of print. Although this may be supplemented by reference to Netter's translation (1889) of Peters' "Pictorial History of Ancient Pharmacy and Medicine," there is obviously room for a further work of the kind in the English language. The author's main object in undertaking

his task was to meet the need for students of pharmacy "to know something of the history of general science and of some of the professions, arts, and sciences particularly related to pharmacy, and of concurrent events in general history as well." The field covered is thus extensive, particularly as pharmacy is so closely associated in its historical development with medicine and with chemistry.

The book traces the progress of pharmacy from ancient times until the present day, and it may be commended as giving a balanced and generally accurate account of the subject. It is surprising, however, that the author, neglecting the recent researches of Ruska, Holmyard, and others, refers to Geber as a semi-mythical character who may have lived—*pace* Campbell Brown—in the eleventh century.

The author, who does not disdain the split infinitive, writes in a very pleasant style, which will enable his English readers to overlook occasional Americanisms such as "the world was made safe for astronomy by Copernicus"; Robert Hooke "made the wrist watch safe for humanity"; and Antony Leeuwenhoek "was the proprietor of a dry goods store."

The account of the development of pharmacy in America contains much information which is not readily accessible elsewhere. It is interesting to learn from this section of the book that within the past ten years the entrance requirements of the American Association of Colleges of Pharmacy have been advanced from "none" to "four years of high school," and that the baccalaureate and doctorate in pharmacy call for a four-year and a seven-year course, respectively. America is evidently bent upon making pharmacists safe for the world. Nevertheless, in spite of educational progress, "the pharmacist of 1801 was a craftsman who was dependent upon his own resources and his own ingenuity for most of his chemicals and preparations, while his professional descendant, at the end of the same century . . . reared in the lap of comparative luxury . . . instead of devoting his spare time to increasing his professional and scientific work, followed the line of least resistance, which is the line of merchandising."

The book contains 64 interesting full-page illustrations, most of which are photographic reproductions of pages of old pharmaceutical works. There is also a chronological table and a useful bibliography of some 150 titles; by an oversight, Wootton's "Chronicles" has been omitted from the latter, although it is quoted in the introduction. The text is well printed and remarkably free from misprints and minor errors: among these may be noted "Einseideln" for Einsiedeln (p. 239); "Marggraff" for Marggraf (p. 363); "Weiglieb" for Wiegleb (p. 364); and "Hennel" for Hennell (p. 471). Finally, who is in the right concerning Daffy's Elixir? According to Conan Doyle ("Micah Clarke," chap. ix), Mistress Mary Clarke put a small phial of this preparation into the barrel of Micah's left pistol on the twelfth day of June, in the year 1685; the present author, however, ascribes this "celebrated nostrum" of compound tincture of senna to "the first decade of the eighteenth century."

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

GLASGOW SECTION

The opening meeting of the session was held, jointly with the Chemical Engineering Group and the Glasgow Section of the Institute of Chemistry, on Wednesday, October 19, in the Cadoro Restaurant, Glasgow. Mr. S. H. B. Langlands, Chairman of the Section, presided.

Interesting papers on "The desiccation (De Vecchis) process of beet sugar manufacture," and "the drying plant used" were given by Messrs. C. Scott Garrett, M.B.E., D.Sc., F.I.C., and G. W. Riley, M.I.Chem.E. As advance proofs of the papers for use of members only had been distributed, Dr. Scott Garrett confined his remarks to the more salient features of the process and to a brief description, illustrated with lantern slides, of the plant.

The De Vecchis process for the manufacture of sugar from sugar beet differed, he said, from the process now in use in that the sugar beet after being washed and sliced into cossettes is subjected to a drying process. Fresh beet would not keep, and had to be extracted when harvested, resulting in an intensive campaign occupying here about three months of the year, or less in warmer climates.

In the defecation of the juice, a unique feature of the De Vecchis process is the addition of superphosphate to neutralise the excess of lime and decompose any calcium sucrose formed.

Other advantages mentioned were the increased amount and quality of the exhausted pulp due to its albumenoid content, the fertilising value of the press cakes due to the contained phosphates, and especially the non-putrescible nature of the effluent which made its treatment a relatively simple and inexpensive matter.

The discussion which followed was exhaustive, and many questions, together with studied criticism of the process, were put forward, particular attention being paid to the whole economic position of the manufacture of sugar from sugar beet.

The thanks of the meeting were conveyed to the lecturers by Prof. Wilson, Chairman of the Glasgow Section of the Institute of Chemistry.

In reply to greetings conveyed by Mr. H. J. Pooley, Hon. Secretary of the Chemical Engineering Group, the Chairman expressed the pleasure which the Glasgow Section had in the presence of so many friends from England, and said that he hoped in the future that there might be more frequent interchange of lectures among the various Sections.

NOTTINGHAM SECTION

The first meeting of the session was held jointly with the Midlands Section of the Society of Dyers and Colourists, on October 19, at University College; Mr. Pentecost in the Chair. Mr. John Allan (Messrs. Joseph, Crosfields, Ltd.) read a paper on "Soaps in textile industries."

Mr. Allan said that soaps, which as used are essentially the sodium and potassium salts of fatty acids, are made from a large variety of fatty substances. Yet only a very few fatty acids were concerned with soap-making. Of these fatty acids some were saturated, the most important of which were lauric, myristic, palmitic and stearic, whilst the most important unsaturated acids were oleic, linoleic, and linolenic acids. In soap-making a detailed knowledge of the properties of the sodium and potassium salts of these acids was desirable.

The "sodium" soap of lauric acid produced a voluminous lather very readily, with the formation of very large bubbles which were very prone to collapse. As one passed up the series to palmitic and stearic soaps, the volume of the lather and size of the bubbles diminished, but the texture of the lather was finer and more permanent. The lathering properties of a soap could not be taken as a measure of its cleansing power; thus the lathering properties of saponins were inferior to soap in cleansing power.

The properties of a soap were mainly determined by the constituents of the soap, and specific properties might be given for special purposes. Some soaps produced a slimy lather, which although soluble could be removed completely from the fibre only with difficulty. Mr. Allan referred to the work of McBain, who, he said, attributed the detergent action of the soap to the formation of a colloid aggregate micelle of high ionic mobility. The electrically-charged aggregate might facilitate the loosening of the dirt, which was then adsorbed on the micelle. The method of estimating the detergent efficiency of a soap by the degree of lowering of the surface tension gave only approximate values.

Soap was used in the textile industry to remove impurities etc. from raw materials, to remove added fatty matter, to facilitate mechanical treatment, in the dye-bath to increase dye-penetration, and in the finishing of many goods. The importance of the complete removal of the soap from the fabric before storing was emphasised. Soap left in the fabric might cause serious damage, as the fabric might acquire an undesirable odour, owing to oxidation and decomposition of the soap. It appeared that the oxidation is greatly stimulated by the presence of small quantities of highly-unsaturated substances which are themselves first oxidised and then function as oxidation catalysts. As an example, Mr. Allan stated that the colouring matter of palm kernel oil was readily oxidised, after which the oxidation product was capable of stimulating the oxidation of other constituents. These products of oxidation were often resinous in character and adhered tenaciously to the fabric. Again, any residual soap might become carbonated by the carbon dioxide of the air, free fatty acid being liberated. Mr. Allan concluded by emphasising

the necessity for the use of soft water in the treatment of fabrics in which soap was a factor.

A good discussion followed, in which the Chairman, Prof. Pyman, F.R.S., and others took part.

CALENDAR OF FORTHCOMING EVENTS

Oct. 28.—Coke Oven Managers' Association. Visit to H.M. Fuel Research Station, East Greenwich, by the courtesy of Dr. C. H. Lander.

Oct. 28.—Institution of Chemical Engineers, at the Institution of Civil Engineers, Great George Street, Westminster, S.W.1, at 6.30 p.m. Public Lecture by Sir William Bragg, K.B.E., F.R.S., on "Crystallisation."

Oct. 28.—Society of Chemical Industry, Liverpool Section. The University, Liverpool, at 6 p.m. Presentation of Leverhulme Prize and Society of Chemical Industry Prizes. "Merseyside and chemical industries," by Dr. A. Holt.

Oct. 28.—Society of Chemical Industry, South Wales Section. Joint meeting with the Local Section of the Institute of Chemistry, Thomas's Cuff, High Street, Swansea, at 7.30 p.m. "The manufacture of dyes," by D. H. Hey.

Oct. 31.—Society of Chemical Industry, Yorkshire Section. Joint meeting with the Institute of Chemistry, Leeds Area Section. The University, Leeds, at 7.15 p.m. "Flame," by O. C. de C. Ellis.

Oct. 31.—Chemical Industry Club, 2, Whitehall Court, S.W.1, at 8 p.m. Annual General Meeting.

Nov. 1.—Society of Chemical Industry, South Wales Section. Technical College, Cardiff, at 7.30 p.m. "The care of the eyes in industry," by T. Lewis.

Nov. 2.—Society of Public Analysts, Ordinary Meeting. St. Mary's Hospital, W.2, at 8.15 p.m. (1) "The biological tests for blood," by Sir W. Willecox. (2) "The technique of the precipitin test and its forensic value," by G. R. Lynch. (3) "The use of the blood grouping reactions in forensic investigation," by F. C. Martley. Informal Dinner at 6.30 p.m. at 178, Piccadilly, W.

Nov. 3.—Chemical Society, Ordinary Scientific Meeting. Burlington House, Piccadilly, W.1, at 8 p.m. (1) "Complex salts of nickel with various aliphatic diamines," by F. G. Mann. (2) "Mechanism of the formation of citric and oxalic acids from sugars by *Aspergillus Niger*," by T. K. Walker, V. Subramaniam and F. Challenger. (3) "The complex cyanides of molybdenum," by W. R. Bucknall and W. Wardlaw. (4) "Parachor and chemical constitution. Part VI. Some cases of supposed ring-chain tautomerism," by F. B. Garner and S. Sugden.

Nov. 3.—Society of Chemical Industry, Bristol Section. The University, Woodland Road, Bristol, at 7.30 p.m. "The manufacture of viscose artificial silk," by H. H. S. Clotworthy.

Nov. 4.—Society of Chemical Industry, Manchester Section. Blackfriars House, Blackfriars Street, Manchester at 7 p.m. Jointly with the Manchester Sections of the Institute of Chemistry, Society of Dyers and Colourists, and the Manchester Literary and Philosophical Society. "Some new principles in chromotherapy," by Prof. A. G. Green.

Nov. 7.—Society of Chemical Industry, London Section. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "Recent advances in the hydrogenation of oils." General introduction by E. R. Bolton. Part I. (a) "Selective hydrogenation," (b) "Melting point of hydrogenated oils," by K. A. Williams. Part II. "Hydrogenation of fatty acids and neutral oils," by R. G. Pelly. Part III. "The activity of a nickel catalyst," by E. J. Lush.

CHEMICAL SOCIETY

The first ordinary scientific meeting of the session was held on October 20, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., occupying the Chair. The President referred with regret to the deaths of 11 Fellows; he also read a resolution of the Council expressing regret at the death of Prof. Svante Arrhenius, a distinguished Honorary Fellow, and appreciation of his important contributions to chemical knowledge, the company present standing. It was announced that the jubilee dinner of the Institute of Chemistry would be held in London on December 15, and that the ordinary Scientific meeting arranged for that evening would be abandoned. A ballot for the election of Sir J. J. Thomson, O.M., F.R.S., as an Honorary Fellow will be held on November 3. The President read an address which will be presented at the Marcelin Berthelot Centenary celebrations in Paris on October 23-26, the Society being represented by the President, Mr. A. Chaston Chapman, and Prof. C. S. Gibson. Fellows were invited to attend a lecture entitled "Crystallisation," by Sir William Bragg, K.B.E., F.R.S., before the Institution of Chemical Engineers on October 28 at 6.30 p.m., at the Institution of Civil Engineers, Great George Street, S.W.1.

Prof. T. M. Lowry read the following papers :-

Studies of Dynamic Isomerism. Part XXIV. Neutral Salt Action in Mutarotation. [With G. F. Smith.]

(a) ALTHOUGH the mutarotation of glucose is catalysed by acids and bases, as well as by water, it is not affected appreciably by neutral salts of the type of sodium chloride.

(b) Definite catalytic activity has been detected, however, in (i) the undissociated molecules of a strong or weak acid, (ii) the anion of a weak acid, (iii) the cation of a weak nitrogenous base.

(c) The catalytic coefficients of these components are $[HCl]$ about 0.5, $[NH_4] = 0.0011$, $[HAc] = 0.0065$, $[Ac] = 0.069$.

Studies of Dynamic Isomerism. Part XXV. The Mechanism of Catalysis by Acids and Bases.

1. THE catalysis by acids and bases of prototropic change and of hydrolysis is interpreted in terms of an electrolytic theory, according to which a flow of valency-electrons through the molecule is produced by bringing a proton-donor and a proton-acceptor, or a proton-donor and a hydroxyl-donor, into contact with the two terminals of the labile complex.

2. An explanation is given of the parts played, in the catalysis of isomeric change, by (i) neutral water, (ii) the molecules of a strong acid, and (iii) the anions of a weak acid, (iv) the cations of a weak base. The ineffectiveness of metallic cations in isomeric change, and of the anions of an acid in hydrolysis are also accounted for.

Dr. E. K. Rideal inquired to what extent Prof. Dawson and the author had made out a definite case for a catalytic activity of the undissociated molecule of acetic acid. It appeared that the development of the theory of catalysis in solutions had arrived at the point

where it could be stated fairly definitely that the mechanism involved the formation of a quasi-compound between reactant and catalyst, and that this compound was in mass-equilibrium with the reactants. Thus $[A, B]_{AB} = k[A]f_A[B]f_B$, whence the velocity of the reactions, assumed to be proportional to the concentration of the quasi-compound, would be given by $dx/dt = k[A, B] = k'([A][B]f_Af_B)/f_{AB}$. Such a formulation of the mechanism had been tested by Brönsted and his co-workers, and had also been examined by Bjerrum. It fitted the facts better than the two older views, which could be expressed by the equations: $dx/dt = k[A][B]$ and $dx/dt = k[A][B]f_Af_B$. For acetic acid the hydrogen ion concentration at equilibrium is defined by the mass law: $[H^+] = ([HAc]f_{HAc})/(f_H[Ac]f_{Ac})$, and neglect of the activity coefficients might cause considerable errors in the evaluation of the hydrogen ion concentration which was required for testing the reaction velocity equation of Brönsted and Bjerrum.

Prof. Lowry replied that Dawson's work had shown that the main facts of catalysis by acids could be explained without replacing concentrations by activities which appeared to involve relatively small corrections. Experiments on mutarotation had confirmed this result. As regards the inactivity of neutral molecules, which Brönsted had postulated, it was noteworthy that neutral water is an excellent catalyst for mutarotation, although it contains only a trace of free ions. At the isoelectric point 99.9% of the mutarotation is due to neutral molecules, which are therefore the chief catalytic components in the system.

Dr. J. D. A. Johnson described :-

10-Chloro-5 : 10-dihydrophenarsazine and its Derivatives. Part V. The General Method of Synthesis and Determination of Constitution. [With C. S. Gibson.]

THE synthesis of 10-chloro-5 : 10-dihydrophenarsazine by preparation of diphenylamine-o-arsinic acid by two methods, and subsequent ring closure is described (cf. J., 1926, 452). This method has been successfully applied to the synthesis and determination of the constitution of 10-chloro-4-methyl-5 : 10-dihydrophenarsazine, 7-chloro-7 : 12-dihydroisobenzophenarsazine, 12-chloro-7 : 12-dihydrobenzophenarsazine, 10-chloro-4-nitro-5 : 10-dihydrophenarsazine, 10-chloro-3 (or 1)-nitro-5 : 10-dihydrophenarsazine and 10-chloro-2-nitro-5 : 10-dihydrophenarsazine. The intermediate compounds and the corresponding phenarsazinic acids have been isolated in each case. Through the synthesis of the above nitro-compounds additional light has been thrown on the nitration of phenarsazinic acid.

Whilst N-methyldiphenylamine-o-arsinic acid has been prepared, attempts to convert it into 10-chloro-5-methyl-5 : 10-dihydrophenarsazine have been unsuccessful.

Prof. C. S. Gibson briefly indicated the scope of the series of investigations of which this paper forms a part.

Mr. E. J. B. Willey discussed :-

Active Nitrogen. Part IV. The independence of the glow and chemical properties of active nitrogen:

SPECTROSCOPIC and critical potential measurements suggest that active nitrogen is atomic in nature, and

possesses a heat of formation of about $2-2.5 \times 10^5$ g.-cal./g.-mol., whereas the author's experiments have indicated that metastable molecules with an energy of only about 45,000 g.-cal./g.-mol. are involved.

The luminosity of "active" nitrogen can be destroyed, by passage through a second weak discharge in a hot tube, without affecting the quantity of chemically-active nitrogen present; moreover, considerable chemical activity can be conferred on nitrogen by the action of an uncondensed alternating current discharge which does not, however, give rise to any luminosity in the gas thus treated.

It is concluded that "active" nitrogen consists of a mixture of a very small quantity of atoms, which on recombination give rise to the luminous phenomena, together with a much larger proportion of metastable diatomic molecules, which are responsible for the chemical activity, but are not luminous. This hypothesis is in agreement with all the observed phenomena connected with active nitrogen, and is paralleled by the behaviour of other elements under the influence of the electric discharge.

CORRESPONDENCE

REMUNERATION TO CHEMISTS—SOME REMINISCENCES

SIR,—Shortly after W. H. Perkin had put artificial alizarine on the market, in the 'sixties, I was introduced to a maker of madder extract (garancine), who also made safflower paste.

He was of opinion that a colouring matter, if not identical with alizarine, could be prepared from naphthalene, following Perkins' scheme. Needless to say, the experiment failed. I made, anyway, a specimen of Roussin's naphthazarine, which pleased Mr. X., who tried it on mordanted cotton.

I was recommended to Mr. X. by a friend, who was aware that I was a voluntary pupil of Hofmann's in 1863-1864.

Mr. X.'s laboratory was merely a long shelf fixed to the wall of a shed. The shed was wet underfoot, and steamy above. I learned that my hours were to be from 6 a.m. to 5 p.m., and the salary £200 per annum. When not experimenting on naphthalene, I was to attend to the garancine and safflower plant.

Asked when I could take up the job, I named a date, and suggested 8 a.m. as a suitable hour to be on the spot, and was met with the remark, "But steam will have been up two hours!" I didn't doubt it, from the appearance of the walls and skylight.—I am, Sir, etc.

P. H

THE VALUE OF A UNIVERSITY EDUCATION

SIR,—We are all much indebted to Mr. McCulloch for his letter in your issue of October 14. It is simply atrocious that any human being should be expected to work under such conditions of appointment; such work might be demanded of a machine, but not of a human being. Might I ask if the name of the firm concerned could not be divulged? It surely deserves publicity.

Yours faithfully,

F. J. WILSON

PERSONAL AND OTHER ITEMS

Imperial Chemical Industries, Ltd., has given £50 towards the establishment of the proposed Chair of Dietetics in the University of London.

The Council of Leeds University has passed a resolution which records its indebtedness to Sir Edward Brotherton for his magnificent gift of £100,000 for a library. The library will be called the Brotherton Library.

Mr. A. W. Folks has been elected Master of the Distillers' Company; Mr. V. Armstrong, Master of the Carriers' Company; and Mr. E. F. Jackson, Master of the Painter Stainers' Company.

Sir Ernest Benn will in future act as managing director as well as chairman of the publishing firm of Ernest Benn, Ltd., and the new deputy-chairman of the company is Mr. G. Robbins, formerly of the *Times*.

Sir William James Larke, K.B.E., has been appointed by Order of Council dated October 5, 1927, to be a member of the Advisory Council for Scientific and Industrial Research.

Dr. J. W. Mellor, F.R.S., Hon. Gen. Secretary of the Ceramic Society, and Principal of the Pottery Department of the North Staffordshire Technical College, was entertained at dinner by the Ceramic Society on October 20, at the North Stafford Hotel, Stoke. During the proceedings, a presentation was made to Dr. Mellor by the Ceramic Society to celebrate his election as a Fellow of the Royal Society. Mr. H. J. C. Johnston, of the Leeds Fireclay Company, the President of the Ceramic Society, presided.

Mr. H. G. Beard, research assistant in the Department of Colour Chemistry of the Technical College, Huddersfield, has been appointed research chemist at Woolwich Arsenal.

Mr. J. Mason, M.Sc., who has been engaged in research work in chemical bacteriology at the University of Birmingham, has been elected to a Faraday Fellowship at St. John's College, Oxford.

Mr. F. J. Blight, who has been head of Charles Griffin & Co., the well-known scientific and technical publishers, since 1899, and has been associated with the firm since even an earlier date, is now retiring.

Mr. J. W. Baker has been awarded the degree of D.Sc. in chemistry by the University of London.

Mr. W. V. Thorpe has been appointed lecturer in biochemistry in the Department of Physiology of the University of Birmingham.

The Institute of Metals is now in its new headquarters at 36, Victoria Street, S.W.1. An additional reading-room and library are now available for members.

The late Mr. J. H. Reynolds, formerly Director of Higher Education in Manchester and principal of the Manchester School of Technology, to whose wisdom and powerful advocacy the present College of Technology owes its existence, left £3042.

The late Mr. J. A. Hine, late H.M. Superintending Inspector of Factories for the North-Eastern Division, left £7114.

The death took place suddenly, at Tiddington, Stratford-on-Avon, on October 22, of Sir Gerard Albert Muntz, Bart., aged 62. From 1896 to 1921 he was managing director and consultant director of Muntz's Metal Company. He made an exhaustive duty of the properties of copper, copper alloys and other non-ferrous metals, and investigated the deterioration of brass condenser tubes and the chemical and electrolytic action of sea-water on sheathing. He was president of the Institute of Metals in 1910-1911, chairman of the Associated Manufacturers of Brass and Copper Tubes of Great Britain, chairman of the Brass and Copper Tube Association, and chairman of the Metallurgical Section of the Department of Scientific Research.

The following have passed the September examinations of the Institute of Chemistry:—Examination in General Chemistry for the Associateship: Macadam, G. H., B.A. (Cantab.); Osborn, H. W., L.; Smirles, W. N., B.Sc. (Lond.); Smith, A., B.Sc. (Lond.); Wilson, H. N. Examinations for the Fellowship:—In Branch D: Biochemistry, with special reference to the Hormones: Fuller, A. T., Ph.D. (Lond.). In Branch E: The Chemistry (including Microscopy) of Food and Drugs, and of Water: Jones, H. H.; Trace, L. H., B.Sc. (Lond.); Turner, C. E. In Branch G: Industrial Chemistry, with special reference to Petroleum Technology: Kelly, C. I., M.Sc. Tech. (Manc.). Chemical Technology of Textiles: Jackson, S. R., B.Sc. Tech. (Manc.). Special Examination in General Chemistry: Beaumont, G. W.

Labour Policy of Imperial Chemical Industries

A conference will be held on October 31 between the chief labour adviser of Imperial Chemical Industries, Ltd., and representatives of the National Union of Drug and Chemical Workers, to discuss the Union's application for the setting up of machinery to deal with questions raised by members employed at the combine's works at Northwich, Middlewich, Widnes, Fleetwood, Blackley, Huddersfield, Billingham-on-Tees, Gateshead-on-Tyne, London and elsewhere.

The Sir John Cass Technical Institute

The 26th session's work of the Sir John Cass Technical Institute was formally inaugurated on October 10, when Sir William Beveridge, Vice-Chancellor of the University of London, visited the Institute, and delivered an address.

The Rev. J. E. Marr, the Chairman of the Governing Body, who presided, said real progress had again been made, and that the Institute's reputation for the teaching of pure and applied science had been enhanced. Many students pursued a course of study with the definite object of graduating at London University, the total number of registered internal students of the University during the past session being 107. Of the 35 students who had been successful at the University examinations, 6 had obtained the degrees of M.Sc. as the result of theses based on research carried out in the department of chemistry. The research carried out by two of the members of the full-time teaching staff resulted in the degree of D.Sc. in statistics of London University being conferred on Mr. A. E. R. Church, B.Sc., M.A., and the

degree of D.Sc. in chemistry on Mr. J. W. Cook, Ph.D., M.Sc., lecturer in organic chemistry.

In the programme of work for the present session, further facilities for study are being provided, of which particular mention was made of the full day courses in Navigation and Seamanship etc., and the additional evening courses in spectroscopic analysis, law as related to industrial chemistry, and economic geology.

Sir William Beveridge, to whom students who had gained special successes during the past session were presented, stated that technical education was primarily the imparting and acquiring of useful knowledge, and this gave man a greater power over the forces of nature, and at the same time an increase in material wealth. He emphasised the importance of brain power and scientific and technical education as factors in the maintenance of our industrial supremacy.

Petroleum in Colombia

It is reported from New York that the President of Colombia has given the Anglo-Persian Oil Company the right to develop all Government oil reserves in Colombia.

Italian Chemical Industry

The Montecatini Società Generale per l'Industria Mineraria ed Agricola, the chief producer of chemicals and allied products in Italy, has recently floated a bond issue of \$10,000,000 in the United States, to find the capital necessary to ensure for developing its mines and plant.

Projected Amalgamation of German Dye Firms

It is reported that important German dye-manufacturing firms, such as the Heyl-Bernger Farbenfabriken of Berlin, the Gutsbrod dye manufacturing concern, the Franz Rasquin Dye Works of Cologne, the Siegle Dye Works of Stuttgart, the Vossen Bros. Dye Works of Aix, and the Schroeder and Tadelmann Co. of Niederlahnstein, are negotiating for amalgamation and the establishment of a German Dye Works Company (Deutsche Farbwerke A.-G.). The company would have a capital of from £750,000 to £1,000,000, and would not be in opposition to the German I. G. Farbenindustrie A.-G., which it was hoped would have a financial interest in the new concern.

New Method for Preparing Water-resistant Colour Lakes

According to a preliminary account (*Chem.-Z.*, Sept. 10) of a new method of preparing water-resistant lakes for lithography, the dyestuff is precipitated with a specially prepared solution of casein triphosphate under varied conditions. So far the method has been used to convert certain substantive dyes, sulphonated basic dyes, azo dyes, and sulphonated nitro dyes into light-fast lakes.

The Photographic Industry in Russia

The French syndicate "SIMP" has obtained from the Russian Government a concession for the manufacture of photographic materials. It is expected that a factory at Podmoskowna will start to produce photographic papers and cinematograph films next year.

Chloramine as a Laundry Disinfectant

According to an order of the Prussian Minister of Public Welfare, there are no objections to the use of chloramine as a laundry disinfectant for white materials.

On the other hand, for coloured materials, wool, and silk it is said to be unsuitable.

Hungarian Bauxite Industry

It is estimated that the newly discovered Hungarian bauxite deposits contain 200 million m. tons, and that the production for 1927 will amount to 250,000-300,000 m. tons. The development of the industry is due to the export to Germany, which amounted to 24,000 m. tons in the first quarter of 1927. The erection of an aluminium factory in Budapest is projected, and research on the preparation of bauxite cement is to be undertaken.

COMPANY NEWS

BRYANT AND MAY, LTD.

A dividend has been declared at the rate of 7%, less tax, for the half-year ended September 30, 1927, on the preference shares, and an interim dividend of 6%, free of tax, on the ordinary shares. Last year's interim on the ordinary shares was 4%. An interim dividend of 5%, free of tax, will be paid on the partnership shares for the half-year ended September 30, 1927.

LAWES' CHEMICAL MANURE CO., LTD.

The report for the year ended June 30, 1927 shows a net profit of £1460, which, with the balance brought forward, makes £4802, which the directors recommend be carried forward.

BUELL COMBUSTION CO., LTD.

This company announces that under the agreement between it and Messrs. Babcock & Wilcox, the latter company has acquired the sole and exclusive right to make and sell all burners and parts and accessories and parts under the patents respectively for use only with water-tube boilers, and the right to use the same with water-tube boilers.

BABCOCK AND WILCOX, LTD.

An interim dividend has been declared of 7%, tax free, on the ordinary shares, which compares with an interim of 5%, tax free, for the previous year.

RHODESIAN AND GENERAL ASBESTOS CORPORATION, LTD.

The ordinary general meeting was held on October 18, Sir Edmund Davis (chairman and managing director) presiding. After briefly reviewing the accounts for the year ended March 31, 1927 (cf. CHEM. AND IND., August 26, 1927, p. 774), the chairman stated that the total Rhodesian production of asbestos for 1926 amounted to 33,344 tons, of which the company's contribution was 26,863 tons. In view of the satisfactory development of the company's property the power plant is to be extended, and when this is in full operation, probably in the second half of 1928, it is estimated that the output will be about 34,000 tons per annum. Since the issue of the report about two months ago, it was found that a larger capital expenditure was necessary, and it was decided to issue the whole of the 50,000 shares now being created.

VAL DE TRAVERS ASPHALTE PAVING CO., LTD.

An interim dividend has been declared of 6d. per share, less tax, on the fully-paid shares, and 3d. per share, less tax, on the partly-paid shares, being at the rate of 5% per annum, the interim for last year being the same.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

- Acid Acetic, 40% tech.—£19 per ton.
 - Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 - Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 - Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 - Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 - Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 - Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 - Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 - Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 - Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 - Copper Sulphate.—£25—£25 10s. per ton.
 - Methylated Spirit, 61 O.P. - Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 - Nickel Sulphate.—£38 per ton d/d.
 - Nickel Ammon. Sulphate.—£38 per ton d/d.
 - Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 - Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 - Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 - Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 - Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 - Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market. 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 - Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 - Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 - Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.
- #### RUBBER CHEMICALS
- Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 - Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 - Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 - Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 - Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 - Carbon Black.—5½d. per lb., ex wharf.
 - Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 - Chromium Oxide, Green.—1s. 1d. per lb.
 - Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithopone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron." £13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9.—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride. 4d.—7d. per lb., carboys extra.
Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep. 6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime. —Brown, £9 10s.—£10 per ton. Good demand.
Grey, £14 10s. —£15 per ton. Liqueur, 9d. per gal.
Charcoal. —£6—£9 per ton, according to grade and locality. Foreign competition severe.

Iron Liqueur. 1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liqueur.—9d.—10d.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.

Wood Tar.—£4.—£5 per ton.

Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 7½d. 8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.

Acid Cresylic, 90/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4½d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.

Anthracene Paste.—A quality, 2½d. per unit, 40% £5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.

Benzole. Crude 65's, 9½d.—10d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.

Toluole.—90%, 1s. 4d.—1s. 6d. per gal. Pure, 1s. 6d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.

Creosote. Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1¼%.

Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10½d. per gal. Solvent 95/160, 10½d.—1s. 4d. per gal. Solvent 90/190, 8½d.—1s. 3d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.

Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—84s.—85s. per ton, f.o.b. according to district. Market firm.

Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180.—4s.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 9d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.

Acid H.—3s. per lb.

Acid Naphthionic.—1s. 6d. per lb.

Acid Neville and Winther.—4s. 9d. per lb.

Acid Sulphanilic.—8½d. per lb.

Aniline Oil.—8d. per lb., naked at works.

Aniline.—4s.—8d. per lb., naked at works.

Anthranilic acid.—6s. per lb., 100%.

Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—6½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.

Dinitrochlorobenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

p-Nitraniline.—1s. 8d. per lb.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—8½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage, paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton. Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. 6d. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth

Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—

8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—

8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb.

Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Sub-

chloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—

7s. 9d.—8s. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liqueur

Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.

—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d.—2s. 4d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb.,

Granulated $\frac{1}{2}$ d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. 2d.—1s. 3 $\frac{1}{2}$ d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7 $\frac{1}{2}$ d. per lb., according to quantity.

Croosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10 $\frac{1}{2}$ d.—1s. 1 $\frac{1}{2}$ d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P., 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2 $\frac{1}{2}$ %; Heavy Commercial £21 per ton, less 2 $\frac{1}{2}$ %; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 8s. 6d.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots.—Red oxide, 7s. 6d.—7s. 7d. per lb.; Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb.; Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.; Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.

Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonol.—8s. 9d.—9s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2 $\frac{1}{2}$ %.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hypsulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 7 $\frac{1}{2}$ d.—1s. 8 $\frac{1}{2}$ d. per lb. Crystal, 1s. 8 $\frac{1}{2}$ d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonol.—6s. 9d.—7s. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.

Aubepine (*ex Anethole*).—11s. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.

Coumarin.—9s. 9d. per lb.

Citronellol.—13s. 9d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. per lb.

Ethyl Phthalate.—2s. per lb.

Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 15s. per lb. (*ex Shui Oil*) 10s. 6d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—(*ex Shui Oil*) 14s. 6d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d. per lb.

Camphor.—75s. per cwt. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 9d. per lb., c.i.f. U.K. port, for shipment over 1928. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 3d. per lb.

Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—7s. 3d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—9s. 9d. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 6d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Dec. 19th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Nov. 3rd. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Allen. Rectifying mixed gases. 26,972 and 26,974. Oct. 11. (U.S., 3,1.27 and 18.2.27.)

Boucherot and Claude. Refrigerating etc. 26,964. Oct. 11. (Fr., 11.10.26.)

- Cross. Muffle furnaces. 26,788. Oct. 10.
 Cuker and Komers. Purification of solutions. 27,347. Oct. 14. (Austria, 14.1.27.)
 Feige. Apparatus for carrying out chemical reactions. 27,441. Oct. 15. (Ger., 15.10.26.)
 Handley. Filters. 27,382. Oct. 15.
 Higgins, and United Water Softeners, Ltd. Apparatus for carrying out reactions involving base exchange. 27,174. Oct. 13.
 I.-G. Farbenind. Catalysts. 27,285. Oct. 14. (Ger., 3.3.27.)
 Nielsen. Production of dry powders from solutions etc. 26,816. Oct. 10.
 Petersen. Means for contacting gases and liquids. 26,852. Oct. 10. (Ger., 21.6.27.)
 Poverud and Sonsthagen. Grinding etc. mills. 27,405. Oct. 15.
 Reavell. Spray-drying plants. 27,304. Oct. 14.
 Selden Co. Catalytic apparatus. 26,925. Oct. 11. (U.S., 27.10.26.)
 Whatmough. Apparatus for production and dispersion of solids in liquids. 27,255. Oct. 14.

I.—Complete Specifications

- 9239 (1926). Bataafsche Petroleum Maatsch., and Moser. *See* II.
 19,226. (1926). Benson. Separation of mixtures of gases. (273,229.)
 20,856 (1926). British Dyestuffs Corp., Hollins, and Chapman. Decolorisation of aqueous liquids. (278,485.)
 28,069 (1926). Masc. Continuously determining quantitatively a given constituent of a mixture of gases. (271,027.)
 32,518 (1926). Vohl & Co. *See* VII.
 *25,967 (1927). La Mont Corp. Effecting heat exchange. (278,704.)
 *26,204 (1927). Siemens-Schuckertwerke A.-G. *See* XI.
 *26,247 (1927). Blau. Separation of mixtures of gases and gases with vapours. (278,712.)
 *26,431 (1927). Pehrson. Extracting suspended or dissolved substances from gases or liquids. (278,722.)

II.—Applications

- Algem. Norit Maatsch. Producing activated carbon. 27,318. Oct. 14. (Ger., 16.10.26.)
 Alox Chem. Corp. Atomisable mobile fuel product. 26,823. Oct. 10. (U.S., 2.3.27.) Producing emulsion from partially oxidised petroleum wax. 26,824. Oct. 10. (U.S., 23.3.27.)
 Atkinson. Recovery of petroleum from oil-bearing sands. 26,800. Oct. 10.
 Corson. Manufacturing hydrocarbons from calcium carbide. 27,198. Oct. 13. (U.S., 14.10.26.)
 I.-G. Farbenind. Heating carbonaceous materials. 27,199. Oct. 13. (Ger., 28.10.26.)
 Johnson (I.-G. Farbenind.). Treating coke oven gas. 27,202. Oct. 13.
 Thornton. Apparatus for detecting presence of inflammable gas. 26,888. Oct. 11.

II.—Complete Specifications

- 9239 (1926). Bataafsche Petroleum Maatsch., and Moser. Manufacture of finely divided substances from natural emulsions or suspensions. (278,395.)
 16,942 (1926). Street and Hey. Purification of waste lubricating oils. (278,434.)
 18,232 (1926). Soc. pour l'Exploit. des Proc. Urbain. Manufacture of active carbon. (255,871.)
 20,960 (1926). Woodall-Duckham (1920), Ltd., Smith, and Finlayson. Manufacture of gas. (278,486.)
 448 (1927). Aluminum Co. of America. Calcining of coke. (269,849.)
 4788 (1927). Synthetic Ammonia & Nitrates, Ltd., and Slade. Steam distillation of coal and the like. (278,577.)

*25,271 (1927). Patentakt. Gröndal-Ramen. Dry distillation of shales. (278,694.)

*25,725 (1927). Soc. du Gaz de Paris. Purification of gas. (278,700.)

*26,583 (1927). Kulzinski. Distilling solid fuels. (278,740.)

*26,606 (1927). General Carbonalpha Co. Manufacture of hydrocarbons and substances containing adsorbed hydrocarbons. (278,745.)

IV.—Applications

I.-G. Farbenind. Manufacture of chlorine-substitution products of 1-amino-2 : 4-dimethylbenzene. 26,937. Oct. 11. (Ger., 11.10.26.) Dyestuffs. 27,293. Oct. 14. (Ger., 23.10.26.)

Johnson (I.-G. Farbenind.). Vat dyestuffs. 26,929. Oct. 11.

IV.—Complete Specifications

11,660 (1926). Morton Sundour Fabrics, Ltd., Morton, Wylam, Harris, and Jones. Dyes and dyeing. (278,399.)
 16,683 (1926). Hooley, Thomas, and Scottish Dyes, Ltd. Production of colouring-matters. (278,417.)
 18,135 (1926). British Synthetics, Ltd., and Higgins. Manufacture of chlorides of ortho-hydroxy-carboxylic acids of polynuclear hydrocarbons. (278,463.)
 7440 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (278,651.)

18,150 (1927). Hoffmann-La Roche & Co. Manufacture of alkyl and aralkyl derivatives of diphenolisation. (278,672.)

*26,482 (1927). Soc. Chem. Ind. in Basle. Purifying vat-dyestuffs. (278,728.)

*26,483 and 26,937 (1927). I.-G. Farbenind. Manufacture of chlorine-substitution products of 1-amino-2 : 4 dimethyl benzene. (278,729 and 278,761.)

V. Applications

Courtaulds, Ltd., and Taylor. Manufacture of viscose filaments etc. 26,792. Oct. 10.

I.-G. Farbenind. Manufacture of artificial material from alkyl cellulose. 27,211. Oct. 13. Desulphurising viscose silk. 27,294. Oct. 14. (Ger., 23.10.26.)

V.—Complete Specifications

16,818 (1926). Kaufmann. Preparing cellulose for the manufacture of artificial silk etc. (258,836.)

17,245 (1926). Internat. Sugar & Alcohol Co., Ltd. (Soc. Indus. de la Cellulose). Saccharification of wood. (278,450.)

24,333 (1926). Bemberg A.-G. Producing twisted artificial silk from cuprammonium cellulose solutions. (260,564.)

17,585 (1927). Duhamel, and Comp. Gén. des Industries Textiles. Washing or cleaning wool. (273,755.)

20,798 (1927). I.-G. Farbenind. Application of cellulose ethers or esters. (275,653.)

*24,102 (1927). I.-G. Farbenind. Treatment of hydrated cellulose. (278,684.)

*26,324 (1927). I.-G. Farbenind. Precipitating viscose solutions. (278,716.)

*26,564 (1927). I.-G. Farbenind. Manufacture of cellulose acetate solutions and plastics. (278,735.)

VI.—Applications

Johnson (I.-G. Farbenind.). Production of wetting-agents etc. 27,425. Oct. 15. Dyeing with vat dyestuffs. 27,426. Oct. 15.

Taylor. Machines for bleaching fabrics. 26,999. Oct. 12. Bleaching. 27,020. Oct. 12.

VI.—Complete Specifications

11,060 (1926). Morton Sundour Fabrics, Ltd., Morton, Wylam, Harris, and Jones. *See* IV.

*26,706 (1927). I.-G. Farbenind. Treatment of fibres with aqueous liquids. (278,752.)

VII.—Applications

Johnson (I.-G. Farbenind.). Production of hydrocyanic acid. 27,200. Oct. 13. Production of mixed crystals con-

taining potassium and ammonium. 27,201. Oct. 13. Minimising corrosive action of sulphuric acid etc. 27,427. Oct. 15. Selden Co. Contact sulphuric acid process. 26,928. Oct. 11. (U.S., 24.8.27.)

VII.—Complete Specifications

18,247 (1926). Demann. Neutralising ammonium sulphate crystals. (255,876.)
29,959 (1926). Liljenroth. Oxidising ammonia by means of oxygen. (276,295.)
32,518 (1926). Vohl & Co. Purification of solutions of salts. (263,809.)
5205 (1927). Urbain. Producing hydrogen and phosphoric acid. (278,578.)
*26,614 (1927). Metallbank u. Metallurgische Ges. Producing zinc salts. (278,747.)

VIII.—Application

Amsler-Morton Co., Geer, and Morton. Annealing glassware. 26,821. Oct. 10.

IX.—Applications

Carl and Riedel. Material for road beds, floors, etc. 27,193. Oct. 13. (Ger., 15.10.26.)
Davis. Manufacture of cement etc. 26,980. Oct. 11.
Johnson (Amesite Asphalt Co. of America). Manufacture of road-surfacing materials etc. 27,284. Oct. 14.

IX.—Complete Specification

*25,067 (1927). Internat. Copperclad Co. Building-material. (278,691.)

X.—Applications

Ashcroft. Metallurgy of ores containing tin. 27,422. Oct. 15.
Beatty (Bell Telephone Laboratories). Treating magnetic materials. 27,310. Oct. 14.
Cameron & Son, Ltd. Etchells, and Popplewell. Alloys. 27,419. Oct. 15.
Cross. 26,788. See I.
Duffield. Reduction of ores. 26,812. Oct. 10.
Freier Grunder Eisen und Metallwerke. Cupola furnaces. 27,184. Oct. 13. (Ger., 21.7.27.)
James. Extraction of tin from cassiterite. 27,043. Oct. 12.
Kramer. Metal powders. 26,962. Oct. 11.
Tullis. Aluminium alloy. 26,993. Oct. 12.
Wade (Internat. Nickel Co.). Manufacture of wrought iron 26,966. Oct. 11.

X.—Complete Specifications

8518 (1926). Johnson (I.-G. Farbenind.). Reduction of iron ores. (278,167.)
11,282 (1926). Gravell. Pickling of metals. (278,398.)
16,021 (1926). Bury. Treatment of zinc waste. (278,411.)
16,538 (1926). Hopfelt and Nolden. Coating metals with aluminium or magnesium or their alloys. (278,415.)
16,941 (1926). General Motors Corp. Electrolytic deposition of chromium. (254,757.)
17,017 (1926). Warren, and Precious Metal Industries, Ltd. Producing metallised surfaces on bodies containing sulphur. (278,437.)
17,319 and 23,643 (1926). Smith, Garnett, and Holden. Alloys. (278,454.)
21,622 (1926). Krupp A.-G. Treating low-carbon steel and iron. (274,016.)
4262 (1927). New Jersey Zinc Co. Metallurgical operations. (268,302.)
*26,589 (1927). McCluskey. Recovery of precious metals from ores. (278,742.)
*26,442 (1927). Siemens & Halske A.-G. Manufacture of beryllium or its alloys. (278,723.)

XI.—Applications

George. Electric furnaces. 26,784. Oct. 10. (Fr., 27.10.26.)

I.-G. Farbenind. Electrically insulating composition. 26,977. Oct. 11. (Ger., 6.11.26.)
Imbery. Electric furnaces. 26,755. Oct. 10.
Levy. Electric batteries. 27,337. Oct. 14.
Pink. Dry cells. 27,306. Oct. 14.

XI.—Complete Specifications

16,798 (1926). Silica Gel Corp. Dry charged battery plates. (255,059.)
16,941 (1926). General Motors Corp. See X.
17,214 (1926). Knowles. Electrolytic cells. (278,447.)
*26,204 (1927). Siemens-Schuckertwerke A.-G. Electric gas-purifying plant. (278,710.)

XII.—Applications

Kutassy. Soap etc. 27,402. Oct. 15.
Potts (Furskov). Treating fatty materials. 26,998. Oct. 12.
Soc. Anon. des Distilleries des Deux-Sèvres. 26,935. See XX.

XII.—Complete Specifications

16,844 (1926). Welter. Producing soap (254,755.)
*25,393 (1927). Oel- u. Fett-Chemie Ges. Treating tall oil. (278,697.)
*25,898 (1927). Verein. Chem. Werke. Eliminating the unpleasant smell of glycerin obtained by fermentation. (278,703.)

XIII.—Complete Specifications

18,430 (1926). Acheson. Pigment oil compositions. (265,541.)
31,557 (1926). I.-G. Farbenind. Manufacture of lacquers etc. (262,818.)
*25,390 (1927). Du Pont de Nemours & Co. Preventing livering in pigmented carbohydrate compound compositions. (278,696.)
*26,564 (1927). I.-G. Farbenind. See V.

XIV.—Applications

Goodyear Tire & Rubber Co. Preserving rubber. 27,209. Oct. 13. (U.S., 30.11.26.)
Johnson (I.-G. Farbenind.). Production of a reversible paste from rubber latex. 26,791. Oct. 10.

XIV.—Complete Specifications

*24,625 (1927). Goodyear Tire & Rubber Co. Accelerator of vulcanisation. (278,689.)

XV.—Applications

Ehrenreich. Leather, and process for obtaining same. 23,932. Oct. 11.
I.-G. Farbenind. Manufacture of solutions of gelatin in organic solvents. 27,406. Oct. 15. (Ger., 20.10.26.)

XVII.—Complete Specification

17,245 (1926). Internat. Sugar & Alcohol Co., Ltd. (Soc. Indust. de la Cellulose). See V.

XIX.—Application

Carpmael (I.-G. Farbenind.). Protecting grain in storage from vermin. 26,979. Oct. 11.
Deco, Ltd., and Golding. Milk products. 26,817. Oct. 10.
Krause. Sterilising liquids. 27,050. Oct. 12. (Ger., 14.10.26.)
United Dairies (London), Ltd., and Walker. Liquid food preparation. 26,915. Oct. 11.

XX.—Applications

Daudt. Production of tetra-ethyl lead. 27,330. Oct. 14. (U.S., 15.10.26.) Preparation of tetra-alkyl lead. 27,331. Oct. 14. (U.S., 20.1.27.)
Selden Co. Catalytic oxidation of organic compounds. 26,920. Oct. 11. (U.S., 26.8.27.)
Soc. Anon. des Distilleries des Deux-Sèvres. Separation of fatty acids. 26,935. Oct. 11. (Belg. 23.5.27.)

XX.—Complete Specifications

17,155 (1926). Stickings, and May & Baker, Ltd. Manufacture of organic compounds of arsenic. (278,444.)

17,656 (1926). I.-G. Farbenind. Manufacture of heterocyclic compounds. (258,553.)

18,135 (1926). British Synthetics, Ltd., and Higgins. See IV.

31,751 (1926). Schroder. Manufacture of protective and curative agents from glandular organs. (263,155.)

*25,249 (1927). Merck. Production of a scopolamine preparation. (278,693)

*25,475 (1927). I.-G. Farbenind. Manufacture of condensation products of urea. (278,698.)

XXII.—Applications

Grinstead and Salmon. Explosives. 26,926. Oct. 11.

Imperial Chemical Industries, Ltd., and Jenkins. Nitrocellulose products etc. 26,952. Oct. 11. Nitrocellulose solutions. 27,080. Oct. 12.

Nobel Industries, Ltd. (Du Pont de Nemours & Co.). Nitrocellulose solutions etc. 27,339. Oct. 14.

Williams. Explosives etc. 26,749. Oct. 10.

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *British India*: Crockery, earthenware (318); Belting, anti-friction metals, oil engines, leather cloth (319); Humidifying and ventilating plants (320); Measuring steel, paper, glycerin, unsensitised, glazed, photo paper for ferro-prussiate photography (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Burma*: Mining and quarrying machinery (323). *Colombia*: Metal sleepers (C. 2447). *Czechoslovakia*: Hematite iron, ferro-manganese and ferro-silicium (329). *Greece*: Chemical products (335). *Holland*: Perfumery, chemists' and druggists' sundries (336); Red lead (337). *Italy*: Paint, varnish, enamel (339). *New Zealand*: Steelwork (B.X. 3917). *Poland*: Flexible metallic tubing (340). *South Africa*: Sanitary earthenware (326); Soap (B.X. 3901); Electro-plate hollow-ware, electro-plate flat-ware, cutlery, glassware, crockery and aluminium ware (B.X. 3909); Superheater boilers (A.X. 5371). *United States*: Leather (341.)

A New Dyestuff

The British Dyestuffs Corporation, Ltd., has issued a further pattern card illustrating their new chrome colour—Solochrome Yellow 2G, which is applicable to all types of wool materials, especially loose wool and slubbing, where good general fastness is necessary. Owing to the fact that it leaves cotton and silk effects unstained it is of interest for pieces. Its good solubility and levelling power make it suitable for application in various types of circulating machines. Solochrome Yellow 2G is unaffected by sulphuric acid dye-liquors, and is of special interest for use with carbonised materials.

Manufacture of Photographic Plates in Poland

The import duty on glass for use in the manufacture of photographic plates is to be reduced from 25 to 5 zloty

per 100 kg. with a view to encouraging the production of plates in Poland.

News from Advertisements

The University of London announces particulars of the forthcoming Gow Lectures on the Colloid Chemistry of the Rubber Industry, which will be given by Dr. E. A. Hauser, of Frankfurt-on-Main (p. vi).

A chemist, B.Sc., with special qualifications in inorganic and physical chemistry, is required (p. vi).

A junior assistant is wanted for an analytical laboratory (p. vi).

Some second-hand laboratory instruments are required (p. vi).

A highly-trained chemist requires a junior partnership in a chemical concern (p. vi).

There are now 125 firms represented in our Buyers' Guide.

Comfort and Fertilisers

SIR ALFRED MOND is surely mistaken in thinking that the richer classes in the Middle Ages were worse off, so far as material comforts are concerned, than the working classes of to-day, and in thinking that the addition of fertilisers to pasture land can have so great an effect as he seems to suppose. So far as the first point calls for consideration, we have a vivid idea of the Middle Ages derived from scenes at the theatre, old ballads and other poetry, and those authentic pictures of Yuletide and so forth which have portrayed the Middle Ages. So strong is our conviction and so confident our belief that we are prepared to put them to the test. We take down a book from our shelf, intending to be perfectly fair and impartial, we admit that it causes us a slight and temporary disappointment, for it tells us that, if we exclude the castles, the habitations in this country in the fourteenth and fifteenth centuries were lacking in floors, ceilings and chimneys, and were so simple in design that two or three active men could build one or two houses in a day; they had no chairs and no tables, and, indeed, nothing to put upon these had they possessed them. This book is obviously not worth pursuing further; we open a second one and find that in the Royal palaces in this country forks were introduced in the reign of Edward II, and we gather that for some time thereafter forks were reserved for the grown-ups, and that the young princes and princesses were expected to use their fingers instead. The rich, it seems, slept naked in their beds; the poor slept in their ordinary clothes; the rich had "fine" underclothing, made of flax woven at home, the poor had coarse underclothing, sackcloth, made of hemp, also woven at home; we feel prickly all over as we think of it; there were no carpets for the majority of the poor or the rich; if they fell ill an experienced

doctor was called in who consulted the stars, and with this guide culled appropriate herbs from the nearest ditch; for six months in the year they had no fresh meat; their food supply was very scanty, and they were rather lucky if, with the assistance of the astrologers, they lived much beyond the age of forty. In the fourteenth or fifteenth century comfort was not appreciated, for it was not known. Robin Hood was as comfortable in the forest as he would have been in his own house. Evidently our small library is very imperfect. We find no books which confirm our clear vision, but a few which throw doubt on it. The matter is, perhaps, worth further search. Merrie England in the Middle Ages no doubt was merrie, but it was neither healthy, nor safe; the prevalence of leprosy and other plagues seems to indicate rather a low standard of comfort. If as the result of further reading we can confute Sir Alfred Mond on this point, we shall do so.

On his second point, the effect of fertilising the pastures and so improving the cattle and sheep, we are even more confident than on the first point. We have seen skulls in museums, have seen the wild cattle at Chillingham and Bewick's engraving of them, and we feel we are on safe ground. Thorold Rogers wrote a book on the History of Prices and Agriculture; it is a standard book, and it should assist us; it does; it tells us that in the middle of the sixteenth century, when the pastures of this country had somewhat improved, cattle for the navy weighed rather less than 4 cwt. each. This looks as if the improvement in the pasture had not improved the beast as an article of food, which is what we expected. The Rev. W. Denton tells us, however, that in the fifteenth century the ordinary weight of cattle was about 320 lb., and that four such beasts and four horses, or, alternatively, eight such beasts, were used to draw one plough. Adam Smith, in his Wealth of Nations, says: "In the reign of Queen Anne, in 1710, when half the stock of the

kingdom were fed on uninclosed commons, the cattle and sheep sold at Smithfield market weighed on an average as follows: beeves 370 lbs., calves 50 lbs., sheep 28 lbs. Now (1795-1800) it may be stated: beeves 800 lbs., calves 148 lbs., sheep 80 lbs., and lambs 50 lbs. The increase is principally, if not solely, to be attributed to the improvements which have been effected within the last sixty years, and the feeding of our young stock in good enclosed pastures instead of wastes and commons." Surely Sir Alfred Mond cannot be right! We find that in 1740 beeves in Forfar weighed about as much as they did in England a century earlier. Of, course, we must remember that in the winter the cattle had little food; they had their meagre pasturage eked out with straw, ivy and tree loppings, and it seems from many books that in the fourteenth and fifteenth centuries the land in England, that is the pasturage and cultivated land, had been exhausted, and even the practice of adding a little marl once in eighty years had fallen into decay. Marl was almost the only manure in this country in the Middle Ages, and the more we look into the facts the more, up to now, we have found that the addition of fertilizers to the ground has been accompanied by the growth in size of both cattle and sheep. We are not yet convinced, only not quite so sure of our original belief. If we find some good evidence in support of it we will publish it. We hope to find it very shortly; there must be another side, the evidence cannot all support Sir Alfred Mond! Perhaps our readers can help us.

University Training in Science

Our readers are at present being asked to consider whether all is well with the training of the industrial chemist. They may like to ponder at the same time the broader question of scientific education in our universities. This subject is brought forcibly to our notice by criticisms contained in the final chapter of a little book entitled "Procrustes, or the Future of English Education," by Mr. Alderton Pink. Mr. Pink regards the future of elementary and secondary education with hopefulness, but concerning university education he has grave forebodings. He recognises with alarm that the scientific spirit is permeating and that scientific methods are moulding all branches of higher learning; and the two salients on which his attack is concentrated are lectures and research.

Lectures should be abolished, he suggests, for books have made them obsolete. Dr. Johnson, a century and a half ago, we are told, emphasised the futility of lectures, which cannot do as much good as the books from which they are taken. College lectures are no better than a gramophone, and their wasteful duplication in many centres might be avoided by the use of wireless. Fortunately, chemistry lectures may have a chance to survive, together with lectures on shoemaking, so long as they are experimental. More to be condemned than lectures, however, is the pursuit of specialised knowledge, *i.e.*, research. "Research" is the name of a powerful god, made in Germany, and the universities are the shrines where its worshippers perform their rites with fiery zeal. For a contribution to knowledge is deemed the beginning of wisdom; knowledge of man's

origin and past, of nature's unusual moods, of new possibilities of atomic combination or disruption. The goal of it all is the Ph.D. degree, and the young man leaves the university fashioned like a Grecian column, very tall, but also very narrow!

Nevertheless, the system succeeds, and that, according to our author, is the pity of it. So a long-suffering community is being supplied with a plethora of mechanical inventions and chemical marvels, and men to work them withal, but these it has neither the time nor the desire to use; whilst the accumulated results of research, even in a single science, are so vast that no mind can grasp them and no system synthesise them. Meanwhile the ideal of a liberal education, in which intellect and emotion, thought and action are held in equipoise, lies buried and forgotten until the day when the present "cult of research has been reduced to absurdity." Such is the criticism; what is our defence?

Lectures must go; research must go; so Othello's occupation's gone. Yet need it be so? Are not lecturing and instruction in research after all the proper functions of a university professor or lecturer? It is true that both functions are seldom exercised in the highest degree by one man. A Huxley is rare, a Kelvin is rare; a combination of the two is more than can be expected within a single personality. If a man cannot lecture it is easy to say that he ought not to be where he is; and his students may be forgiven for praying for his removal to another, if not a higher, sphere. A good lecturer, however, is an inspiration to his students; he makes dry bones live, he infects his class with his own enthusiasm, he is full of wise saws and modern instances, he is a priest who interprets the spirit of his science. It is his personality that counts, his method of setting forth his subject, so that his students see what they never could see and learn what they never could learn without his aid.

Then as regards research; should not all laboratory work be done in the spirit of research? Every chemical experiment done for the first time is an adventure. Students enjoy qualitative analysis because they are finding out things; and quantitative work should provide a more refined enjoyment. Instruction in the methods of research: what is meant by this common phrase? What other than this? Discovery of what has been done by others on the subject, tabulating and co-ordinating their results, devising a plan of campaign, exercising all possible manipulative skill in arranging and carrying out experiments, meditation upon results that by their puzzling character often offer a challenge which the alert mind gladly accepts, and finally the gaining of the victory and the marching home with the spoils.

Is such training narrow; is it not rather an epitome of the methods of dealing with the larger problems of commerce and citizenship, and so may it not become a real part of the making of a citizen? If its end is to be merely the carrying of another stone to the summit of the amorphous pile of accumulated facts of science, then its aim may be intrinsically trivial; but if its end is to be the training of hand and eye and mind for the service of the State, then it furnishes a contribution to our complex life which we cannot afford to lose, even if its benefits to chemical industry are only indirect.

THE CHEMICAL INDUSTRY*

By THE RIGHT HON. SIR ALFRED MOND, BART., M.P.

Imperial Chemical Industries, Ltd., the greatest merger in the history of British industry, is barely nine months old, and is becoming increasingly recognised as one of the main factors in Imperial trade and Imperial industrial relations. It is unnecessary to detail the many advantages of the process of amalgamations in industry. During the last 20 years the economic trend of industries throughout the world has been towards the growth of bigger and bigger units. In America the tendency has developed far more than in this country, and in Germany, owing sometimes to the concurrence, and sometimes almost to the compulsion of the government, cartels have increased in number.

When the strength and advantages of this economic tendency were investigated it was decided that the chief chemical and allied producers in this country should form, not a cartel, but a complete amalgamation or merger. It was felt that successful as the histories of the individual companies had been, and prosperous as the whole industry was under the existing conditions, in order to ensure the supremacy of the British chemical industry throughout the Empire, it should form one indivisible whole, capable of negotiating or combating upon equal terms with the already amalgamated industries in America and Germany.

Any industry which competes in the world's markets must keep up with world economic tendencies. The chemical industry has done so, and will continue to do so. For, by the pooling of financial and other resources, by the pooling of information and research processes, by forming a united front in the markets of the world, in all directions, in industry, in finance, in production, in distribution and in salesmanship, economies could be effected which would increase the prosperity of the industry, increase the prosperity of the consumer, whether intermediate or end, and allow that higher standard of living which all desire to see applied to industrial workers.

The chemical industry plays such an important and predominant part in all industrial developments that the two statements "Chemicals form the foundation of the world's industries" and "The chemical industry is essential to Imperial security" require elaboration rather than justification. The extraordinary amenities and comforts of modern life are so much taken for granted that everyone does not realise the great debt which we all owe to the development of modern industry and the chemical industry in particular.

The standard of comfort enjoyed by the average working man of to-day is greater than that of a wealthy and powerful nobleman of the Middle Ages. Such a state of affairs may well be called a miracle, and it is largely due to the modern industrial system, in which chemicals play such an important part. If we analyse the ordinary doings of the ordinary man throughout the twenty-four hours, we find that all the objects with which he deals and most of the food he eats have come at

some time or other within the province of chemical industry.

Our company can fairly claim to be representative of the industry as a whole. The volume of our production is enormous; in some of our industries such as the alkali trade we discuss our outputs in the terms of hundreds of tons per day. And in those industries such as dye-making, where the tonnages are naturally not so heavy, the output, in its class, is very high indeed. The list of our products if I were to read it to you would take hours. Our four main constituent companies, Brunner, Mond & Co., Ltd., Nobel Industries, Ltd., British Dyes, and the United Alkali Co., Ltd., have a total of seventy-five constituent and associated companies. Our total production amounts to millions of tons per annum, worth scores of millions of pounds in value; our dyes and intermediates total over 5,000 alone, and we make other chemicals and explosives in every imaginable variety. Our consumption of raw materials is enormous, the amount of coal we burn, though you may be assured that every device is employed to do this as economically as possible, runs into hundreds of thousands of tons per annum. Again, we quarry millions of tons of limestone every year.

We employ about 40,000 men, among whom the importance of a small army of chemists and engineers must not be forgotten. We ransack the Universities for talent, and have even been accused of unduly depleting them! Our works are distributed throughout the country, and our selling organisation covers the whole earth. You will find our products in every corner of the British Empire and in remote villages in the centre of China. Our latest selling organisation for fertilisers is very interesting, as it combines an efficient business agency with a research and information bureau. I am alluding to Nitram, Ltd. The production of artificial fertilisers will falsify the prediction of Malthus, and will undoubtedly prevent what would have been a world famine in future years.

Nitram is an organisation of Imperial and world propaganda whose business it is to make known the use and value of the new fertilisers. Already it has a large staff of district advisers in all parts of Great Britain, whose sole duty it is to give free and disinterested advice to farmers not only on nitrogenous fertilisers, but on fertilisers of all kinds.

The alkali trade can fairly claim to be dealing with the raw material of raw materials. The reason that the public is unaware of its extent and importance is that its products have often been used before there is any general interest in the substances produced. Take, for example, the preliminary treatment of cotton, the purification of boiler water, the early stages of paper making—all these operations use alkali in some form or other in the very early stages of production.

Nearly everything, when you go back to it, comes out of the ground. In the alkali trade we begin with common salt, a material of which this country possesses abundance. The largest deposits are situated in Cheshire, which is the centre of the heavy alkali trade. Salt brine is pumped up from the earth and put through an elaborate and continuous series of processes which are mechanised to a very high degree indeed. There are few more

* From an address by The Right Hon. Sir Alfred Mond, Bart., M.P., Chairman of Imperial Chemical Industries, Ltd., read by Dr. F. A. Freeth, F.R.S., in the absence of Sir Alfred Mond owing to indisposition, before the Central Economic League, on October 20, 1927.

impressive sights than the interior of one of these great factories at night: a steady hum of machinery, an astonishingly small number of men, with an output running into hundreds of tons per day from each unit. The alkali industry is also connected with the production of chlorine, the well-known bleaching agent.

There is a very close connexion in the chemical industry between the processes which can make a country prosperous in peace and efficient in war. Consider fertilisers and explosives! The same compound which deals death and destruction can also be a valuable plant food, because in each case it contains that essential body, fixed nitrogen. The explosives industry, of course, is not, as might be supposed, maintained on a basis of preparation for war. The use of explosives in the ordinary arts of peace, coal mining, quarrying, etc., is very great indeed, and our huge explosive works in Scotland and many other places in the country are among our greatest assets.

The fertiliser industry is, as far as we are concerned, a comparatively new one. We have recently erected at Billingham, in the county of Durham, a factory for the extraction and fixation of the nitrogen of the air. This business, as will be shown later, is intimately linked with the future of agriculture in this country. The initiation of this industry has been a brilliant feat of engineering, and one which maintains the traditional high standard of that science in Great Britain. In the past the chemist has probably claimed and received rather more than his share of credit for the success of our industry, which frequently offers greater difficulties to the engineer who puts it into practice than to the chemist who originally worked it out in the laboratory. Good engineering can often turn an unprofitable chemical process into a profitable one.

Our fertiliser process works at extremely high gas pressures, and the technique of handling such pressures not only reflects the greatest credit on those who designed and carried it out, but also affords a means of attacking new problems in similar regions. The artificial production of wood spirit (methanol) is already a fact, and production of oil from coal is another excellent example of the future development of high-pressure technique in this country.

The manufacture of dyes, though originally started in England very soon was captured abroad, and for many years the part played in this important industry by Great Britain was only nominal. To-day this is all changed, and for range, colour, and variety the dyestuffs produced by us will challenge comparison with any others.

The old reproach that the manufacturers of this country are indifferent to science and research is now a thing of the past. Our organisation is not only keenly alive to its necessity and importance, but is actively prosecuting original investigation in every phase of our activities. In this connexion an important point should be emphasised. Research must have an object. There is no such thing as pure research in industry. We have never done any, and will never do so. If you choose to call pure research the investigations of those branches of science from every point of view which are likely to be of benefit to ourselves, my reply would be that, in

that case, we have never done anything else but what you are pleased to call pure research.

The two quotations of chemical achievement of the past which I am about to make to you are interesting, inasmuch as they had a considerable effect on the fate and fortunes of large numbers of mankind, and illustrate the fact that there is practically no vital human need which the chemical industry could not supply if called upon to do so.

During the French Revolution the new, and not then very peaceful, régime was faced with a shortage of soda. Soda is an essential raw material of industry. Any attempt to enumerate its applications would consume the whole of the remainder of our time this morning. If the world were to be deprived of soda to-morrow morning something like industrial chaos would very quickly arise.

Faced with this shortage, the French Government appealed to the patriotism of their chemists, one of whom, Leblanc, discovered his well-known process, using common salt as his raw material. This process saved the young Republic and endured for nearly 100 years, being finally displaced by the modern process, of which the late Dr. Ludwig Mond was the pioneer in this country.

To take a more modern instance, Germany, as we all know, had planned an elaborate national war scheme which naturally included the manufacture of explosives. All the wars of modern times had been fought out with the nitrate fields of Chile as a basis. Germany, realising that she could not hope to maintain the long sea route to Chile, worked out a process using the air we breathe as a raw material for the explosives. This, as we know, did not eventually save her, but it was singularly effective as far as it went.

A minor but interesting application of chemical industrial effort can be found in the motor show at present being held in Olympia. Motoring has become the pastime of the million. The original motor car naturally took a great deal of its colour from the horse-drawn carriage. Its cushions were of leather, and its paintwork was put on in the laborious manner of the older industry. It would be literally impossible to upholster the modern car with leather, whilst the painting of coachwork in the early manner is too expensive for a popular industry. What do we find? Chemical industry has produced a wonderful leather-like material made from semi-nitrated cellulose, and has evolved the same material in a different form as a beautiful hard varnish, admirably adapted to the rough wear of the road.

Turning from the above to a vital matter, the food supply of the world, for several generations civilised mankind has lived on the stored accumulation of centuries lying in the untouched virgin plains of the world. Though not yet exhausted, such supplies are limited, and are not replaceable by nature at the rate at which they are being consumed. Chemical industry has come to the rescue with supplies of fertilisers derived from the atmosphere which, humanly speaking, are illimitable. This country, for example, previously dependent on outside sources of fertiliser, has now developed its own production to an extent which actually enables us not only to supply our own needs, but to export to other nations less fortunately situated than ourselves.

Whilst I should hesitate to predict that this country will ever be independent of outside supplies of food, it may be confidently asserted that the chemical industry will in time put us in a position of reasonable independence with regard to any essential commodities. For example, Great Britain, thanks to its peculiar position and in spite of or rather because of summers such as we have recently enjoyed, is one of the finest grassland pastures of the world. Up till quite recently grass has been regarded as just grass, and no particular attention has been paid to it. It has recently been discovered that if grassland is systematically manured with the artificial fertiliser I have just mentioned, the resultant pasture is extraordinarily rich in the essential foods for cattle. Experiments which have been carried out, among other places, on my own estate have shown that it is possible to raise animals on grass alone which are in equal condition with those fed in the ordinary way which have consumed considerable quantities of imported foodstuffs. And in addition to the above remarkable result, there is every indication that it may be possible to raise a far greater number of beasts per acre than has ever been contemplated before.

Turning to another side of our feeding problems—the necessity for fattening foods—science has recently shown us that materials, such as butter, are essentials for our well-being, and that generally speaking we do not eat enough of them. Formerly we thought that a man was rather like a steam engine—that it was only necessary to provide him with so many calories a day and the human machine would do the rest. The discovery of the vitamins completely destroyed this charming simplicity. Nowadays we know that the vitamins which are contained in butter and similar natural foods play a very great part in our well-being. Now, as you know, an enormous artificial fat industry has grown up in the last twenty years; this fat, though excellent and wholesome food, has not contained those essential ingredients for health to which reference has been made above; the chemical industry is now coming to the rescue, and we are already in sight of artificial vitamins.

As you are aware, we are particularly interested in the utilisation and development of fuel, and I have recently become president of a new institution, the Institute of Fuel, whose aims are to investigate the use of the most vital of our national problems on as wide a basis as possible. In this field also the chemical industry is showing signs of the production of what may be considered miracles in the near future. Besides the well-known problems, such as the proper balancing and co-ordination of power and electrical production, power and ordinary gas, there is the more strictly chemical aspect of the question, such as a universal smokeless fuel and the provision of by-products and petrol substitutes. Within the last few days a speed record has been broken by the use of synthetic petrol.

You have all doubtless read in the public press of the production of oil and petrol from coal. Consider what this may mean to the railways alone in the future. The ordinary express locomotive, magnificent, impressive and attractive as it is, is a shocking sinner as regards the economic conversion of coal into power. The provision of abundant oil at a sufficiently low price and at home

may undoubtedly in time reduce the cost of rail transport and render this country independent in both peace and war of imported oil fuel.

You are probably aware that the future timber supplies of the world are a cause of anxiety to those people whose duty it is to look a long way ahead. If this situation became acute, the chemical industry would undoubtedly come to the rescue with an artificial cellulose substitute.

Most of the greater advances in biology and physiology during the past decade have been made largely with the help of physics and chemistry. It is not too much to expect that such advances will be reflected in the chemical industry. To give an example, we are coming more and more to regard the human body as a complex shifting labyrinth of chemical reactions and secretions. As time goes on, and we get closer and closer to a knowledge of the truth, the industrialist will follow up and will probably extract the essential chemical compounds governing these reactions from animal sources, then later he will prepare them by simpler means; this tendency is now coming forward with insulin. Finally he will synthesise these remarkable materials which may even change the very forms and minds of the human race.

The industry will also naturally play a great part in the prevention of disease. I did not come here to tell you of our own discoveries, but at the risk of being accused of an attempt at a little free advertisement would like to tell you that one of my companies has recently discovered one of the most efficient and complete antiseptics the world has ever seen.

There is practically no need which the chemical industry cannot supply. We may therefore look forward, with confidence, to a future for mankind in which his needs are so obviously met by the chemical industry that he will recognise it as one of the dominant factors of his existence. There is one feature in the situation as regards the future which is uncertain, and is of the greatest interest. The present chemical and, for the matter of that, any other industry depends on what might be called classical science, which has not altered fundamentally for a very long period. For example, a young chemist in 1907 was taught in a very similar manner to his forerunner of 1887. The last twenty years, however, have witnessed an upheaval of scientific thought of the most far-reaching character. At present such new knowledge has not affected the industrial world to any appreciable extent, but if you go back into the past you will always find that a mental revolution has frequently been followed by a physical one. All through last century the triumphs and discoveries of science were followed up in industry. It is therefore not too much to expect that the rapidly-advancing new knowledge will in time be followed up by industrial applications which at present are not even in the speculative stage, and that the future will provide not only a vast increase of those physical amenities which are so characteristic of the present age, but will also produce a change in mental values which will go far to establish a national equanimity. In any such revolution the chemical industry will play a major part, and judging by the success with which it has solved the

formidable problems presented to it in the past, we may look forward to the future with every confidence.

Before concluding a reference must be made once more to the subject of industrial peace, which is easily the most important and fundamental of all industrial problems. Everyone now recognises the insensate folly of continuous industrial warfare, except those who are avowed subverters of the constitution and of the existing social order. Those, I know, it is your whole purpose to combat and defeat.

The chemical industry has had a most fortunate, happy, and friendly past. Over the long period of 53 years there has been no strike, no lock-out, no industrial dispute. The most close and personal contact has happily existed for more than one generation between the captains of the industry and those who work with them. It was stated when the new merger was made that that happy relationship would not be allowed to be altered.

It was only ten days ago that the first instalment of the Labour Programme of Imperial Chemical Industries, Ltd., was announced to the workers and the world. The programme was, in itself, a proof that the same spirit and the same desire still animated those who were charged with the heavy responsibility of the direction of this huge amalgamation, and it was received and accepted as a fruitful augury for the advance of industrial harmony in the new united industry.

The first instalment dealt with five main points, the keynotes of which were personal contact, improved status and increased security, co-partnership in profits, and co-operation.

So important were all questions of labour considered that it was decided to establish a Central Labour Department, under the personal direction of an executive director of the company, who would be assisted by a Chief Labour Adviser and an Advisory Committee to secure the necessary interchange of views between those who form the policy and those who execute it. By a system of works councils, concentric in character, and ranging from the works council of an individual works, through the general works council of a group of works, to the Central Works Council representing the whole of the 40,000 workers in the combine, it was felt that direct personal contact could be maintained between the Board and the individual worker wherever his place of occupation was. The chairman of the Board himself presides over the Central Works Council.

A complaint which has often been raised in industrial relationship concerned the status and security of the worker. By the inauguration of a staff grade of workers, under which all men of five years' service and over would be eligible for promotion to the staff, such men to be paid a weekly wage instead of an hourly rate, and to receive, in addition, a month's notice of termination of employment, payment of wages for holidays, payment of full wages (less National Health Benefit) for all certified sick absence up to six months in any year, it was felt that a concrete instance of increased status and security was being established.

By facilitating throughout the whole combine the acquisition of shares by the workers on preferential terms, all ranks of workers are invited and encouraged to obtain a direct financial interest in the company.

To summarise, the machinery for the ventilation of all potential grievances, the machinery for the free and frank discussion of matters of common interest, the machinery for the co-ordination and unification of labour policy for the worker to advance and become a shareholder in the firm, have already been provided in the chemical industry. There is no doubt that by this means the progress and prosperity of all those engaged, and of the industry as a whole, will be increased, and that the cordial relationship which has existed for so many years will be cemented and strengthened.

The achievement of industrial peace cannot be hastened merely by the desires of enthusiastic amateurs or disillusioned politicians. It can be secured only by the competence and good will of those in whose hands are placed the responsibility for industrial organisation, whether on the side of direction or on the side of labour. There is a new spirit and a new science in the management of the chemical industry. That new spirit and new science is the broad avenue to industrial prosperity and to industrial peace.

AGRICULTURAL RESEARCH

On October 26 Sir Alfred Mond entertained the delegates to the Imperial Agricultural Research Conference to luncheon at the Savoy Hotel.

Proposing the toast of the Imperial Agricultural Research Conference, Sir Alfred Mond said that some less instructed people would probably imagine that conferences of politicians at various times laying down constitutional rules were really of more importance, but those who had inner knowledge knew perfectly well that research, and above all agricultural research, properly carried on and co-ordinated, assisting those all over the vast far-flung territories of the Empire, was more likely to produce results of fundamental and permanent value to all those engaged within the ambit of the British Empire than probably any other form of work that could possibly be done.

The position of agriculture in the world was slowly being recognised. Although it was the most vast industry and the most fundamental industry in the world, it had, on the whole, been carried on without much regard to a scientific basis. Throughout the history of the world it had been looked down upon as a thing which could be carried on by relatively uneducated people, and as being of relatively small importance. If suddenly the agriculture of the world ceased for a very short time, we not having reached the stage of synthetic food production which the future may hold in store, those who had not regarded agriculture in the proper light would be surprised to find what a short time it took before starvation put an end to their earthly career.

He was glad to think that Imperial Chemical Industries, and its subsidiary operating company, Nitram, Ltd., was setting out to render real and, he hoped, increasing service to Imperial agriculture. Under the able guidance of Sir Frederick Keeble, whom he induced to leave the quiet retreats of Oxford in order to engage once more in a more vitalising life, they were now carrying out in co-operation with Government departments, private

growers and commercial corporations, trials of fertilisers in the various parts of the Empire:—

For example, in South Africa trials were being carried on in the Transvaal, Natal, Cape, and Rhodesia; in East Africa, in Kenya, Tanganyika, and Nyasaland; in West Africa, in Nigeria, the Gold Coast, and Sierra Leone; in North Africa, &c., in Sudan and Mauritius; in the West Indies trials were being carried on in Trinidad, Jamaica, and Demerara; in India, in Bombay, Ceylon, and Burma; and also in Palestine, in the Near East, and in Australia. Outside the Empire, trials of fertilisers were being executed in the United States, Egypt, China, Japan, the East Indies, Belgium, and Spain. Both within and without the Empire the crops on which trials were being made were beans, cocoa, coffee, cotton, coconuts, ginger, grass, limes, maize, potatoes, rice, rubber, sugarcane, tea, tobacco, wheat. Many of these trials were designed specially to test the suitability of nitro-chalk for use in tropical and sub-tropical countries. To that end they were making a study of the conditions of soil and climate and temperature throughout the Empire. Evidence had been obtained that this fertiliser was of great value for use within Great Britain, but it would not be produced for export until the results of the trials now being carried out had been received.

Thus they would be able to devise that form of fertiliser best suited to each case.

They were trying out a whole series of new fertilisers in various parts of the world. Arrangements were now being made throughout the Empire, and had already been completed for certain parts of India and in Kenya, for carrying out trials on the suitability of the new fertiliser, ammonium phosphate and nitro-phoska, for use in tropical and sub-tropical agriculture. Representatives of the company were studying conditions in South Africa and Australia with a view to determining to what extent phosphate deficiency and other deficiencies such as potash had been the reason why so little use was being made of nitrogen fertilisers in these countries. Representatives were proceeding to India to investigate the fertiliser position of that country, and to study the best means whereby the company, if called upon to do so, would give effect to the proposals laid before the Royal Commission on Agriculture in India, for a great scheme of co-operation in fertiliser propaganda between the Government of India and this country. Arrangements had also been made for co-operation between the Sudan Government and the company with a view to carrying out fertiliser trials in the Sudan.

They recognised the difficulties of Governments in obtaining from short-sighted Treasuries the necessary funds for carrying out this kind of experimental work, which in its ultimate effect must vastly increase wealth and happiness and economic prosperity, though to those of little imagination it appeared a wasteful means of immediate expenditure. Through their possession of practical imagination, and also owing to their possession of the necessary funds, they were prepared to come in and help, to co-operate, not merely with their knowledge, but also financially. It was a vast and important programme which would take considerable time to work out, although a very good start had been made. They

hoped to be able to solve a good deal by the work of a staff of researchers, economists, and agricultural experts, who by their knowledge, not of one problem but of problems all over the Empire, would be able to give advice and help of a real objective character to others working in the same field.

The importance of the present Agricultural Research Conference was generally recognised and the company had proposed as a means of promoting Empire agriculture the establishment of a Central Imperial body to assist all Imperial Agricultural Departments in all matters relating to fertilisers. The means proposed were, firstly, to issue an authoritative handbook on the planning and recording of field trials and experiments; secondly, the collation and distribution of the results of fertiliser experiments carried out in the different parts of the Empire; and thirdly, the issue of summaries of new knowledge relating to fertilisers.

It seemed that if the proposal were accepted at the Conference, it could best be carried out by co-operation between the proposed Soils Bureau and the representatives of the Ministry of Agriculture, of the Imperial Agricultural Research Conference and of Nitram, Ltd.

They had embarked on what was really a great Imperial mission, not merely with the hope, which he was certain they would achieve, of extending British industry, not merely with the idea of paying some dividend to their confiding shareholders, but still further with the idea of making still more independent and still more self-contained that great economic complex which called itself the British Empire, and which, if united in action, united in work, united in thought, could achieve for itself a position unparalleled among the nations of the world in all the annals of history.

In replying on behalf of the Conference as chairman, Lord Bledisloe said their task was to organise agricultural research within the Empire and to seek the most effective way of carrying its teachings to those to whom they were of importance in their daily task. They must bear vividly in mind in this connexion the work of that, perhaps, greatest of English country squires, Sir John Bennett Lawes, who initiated and became the first manufacturer of artificial fertilisers. He ventured to suggest that Sir Alfred Mond to-day was fulfilling the rôle that Lawes filled fifty years ago. He ventured at Billingham, in the absence of Sir Alfred, to suggest that probably there was no one who combined within himself the rôle of eminent statesman, enthusiastic scientist and leader of industry to the extent that Sir Alfred Mond did. If Sir John Bennett Lawes was the great prophet of phosphates, surely Sir Alfred Mond was to-day the great prophet of nitrate.

But the activities of himself and of his great firm were by no means confined to the synthetic production of nitrate and its various derivatives. He had pointed out that the aim was a very much larger one, that of being in a position to provide the cultivators of the Empire not merely with nitrogenous fertilisers, but with all they required for the chemical nutriment of the economic plants which they raised upon their holdings. Nitrogen was the most important of all plant foods, but in certain parts of our great Empire, and notably in New Zealand and other parts of Australasia, they were suffering from

phosphate starvation. If Sir Alfred Mond and his colleagues would bend their minds to the fertiliser requirements of every type of soil, and every type of economic plant throughout the Empire, they would be fulfilling a most useful and very necessary function.

He was sure they would all agree that the Billingham works, whatever they might be deemed to be from the point of view of the output of important chemical products, were a great masterpiece of engineering as applied to chemical industry. There was no such triumph of engineering in its application to science to be found anywhere in the world. The ultimate aim was to produce human food directly or indirectly from the products of the soil. They were necessary partners in achieving the same goal ultimately, that of winning from the soil of the Empire the largest possible amount of food and other economic products at the lowest possible costs.

"IN CANADA WITH THE EMPIRE MINING AND METALLURGICAL CONGRESS"

By A DELEGATE FROM GREAT BRITAIN

The R.M.S. *Alania* docked at Montreal at about 7 a.m. on Monday, August 22, and the delegates were conveyed at once to the Hotel Windsor, where the opening session commenced punctually at 10 a.m. in the presence of mining engineers and metallurgists from every important country in the Empire and, indeed, from many foreign countries as well.

Sir Robert Horne, as Honorary President of the Congress, made the inaugural speech, which included a masterly summary of the position of the British Empire in respect of the available facilities for the supply of metals. Reminding delegates of the parlous situation which developed shortly after the outbreak of the war — when vital sources of supply either of minerals or of the equally important refining facilities were found to be in enemy or neutral control, Sir Robert set out facts from which he deduced that, except so far as copper is concerned, the present position of the Empire has greatly improved.

The consumption of copper in the world had risen from 1,000,000 tons annually before the war to 1,500,000 tons per annum at the present time, but consumers in Great Britain were at the mercy of the International Copper Cartel, in which the United States had the controlling interest. Nevertheless, progress in Canada and in South Africa was encouraging, and delegates later had an opportunity of seeing at Rouyn how promising the production from north-western Quebec, added to the expected great increase during the next few years from the Frood nickel-copper mine near Sudbury, Ontario, may become.

The world's supply of nickel and of tin was almost entirely under British Empire control, the Province of Ontario having proved supplies likely to last at the present rate of consumption of nickel for at least a hundred years, there being known reserves of 150,000,000 tons of good-grade ore. South Africa, too, had large deposits of low-grade ore. The tin position was interesting as the known reserves were limited, and increased

production at one point was likely to be balanced by decreases elsewhere. Nevertheless, the Empire produced 40% of the present output, and the tin-smelting industry in the East was capable of treating 80% of the world's output of metal, whether originating in the East Indies or in Bolivia. The chrome and cobalt situations were declared to be encouraging.

The metal price situation, however, was a matter for some concern. More metals had been produced during the past quarter of a century than in all preceding ages. High tin prices had brought into production new mines and restarted old ones. The fall in the price of silver resulting from the action of the Indian Currency Commission had destroyed confidence, and the temptation to increased production was therefore tempered by caution.

Turning to coal, Sir Robert declared that the problem of securing a better method of utilisation was important to the Empire, but vital to the Mother Country. There was, however, inspiration in the way our forefathers recovered from the economic aftermath of the Napoleonic wars by the discovery of steam power and the exploitation of coalfields. Britain then made a new start in the world, and retained the lead down to the end of last century. Where can we now turn for a new economic factor which shall rescue the country from the difficulties following the past great war? The answer was to be found, he thought, in two lines of investigation: low-temperature carbonisation, and the treatment of coal with hydrogen at high pressure, the latter having an important relation to the future oil supply of Great Britain and other non-producing countries. He considered that we were in a position to indulge in high hopes of success in commercial operation: the Bergius process converts a larger proportion of coal into oil than some others, and he confidently expected good results from the work now going on in Germany. Success would also mean great things in Great Britain, Australia, and in other parts of the British Empire, which were deficient in domestic oil resources.

Dealing with the question of metallurgical research, Sir Robert referred to the important results attending the introduction of the oil flotation process in lead and zinc reduction. Low-grade ores had been brought into production and old mines brought back into operation. In Canada, particularly, the process had produced very notable advantages. Speaking of the application of electrolysis to zinc production in Canada and Australia, the President instanced the remarkable progress attained by the Electrolytic Zinc Corporation in Australia and the Consolidated Mining and Smelting Company of Canada, Ltd., in both lead and zinc.

In closing, Sir Robert paid a high tribute to the paper which followed, prepared by Sir Thomas Holland, and which in fact constituted the most tangible achievement of the Congress, apart, of course, from the unique opportunity afforded to individuals of discussing technical problems and of seeing the great developments throughout Canada in every branch of mining and metallurgy.

Sir Thomas Holland's paper, entitled "A proposed review of the mineral resources of the Empire," is best summarised by the resolution which accompanied

its introduction, supported as it was by the Institution of Mining and Metallurgy in Great Britain, and carried without dissent by the Congress. The resolution in effect calls for the calling together by the Empire Council of Mining and Metallurgical Institutions of committees of specialists in each of the dominions and larger colonies charged with the duty of reviewing for each country concerned its mineral resources, whether developed, undeveloped, or abandoned, together with its smelting and refining capabilities, having in mind the desirability of accumulating, in addition to the ordinary official statistics of production and movement, the essential data necessary for the formulation of an economic policy, as well as for obtaining the information required to institute measures designed to secure military safety. It was considered desirable that public statistics should be analysed by those who are familiar with the trend of mining and metallurgical development, and who have information which is not available in Government bluebooks regarding minerals that might be worked, or areas that ought to be examined, but under existing conditions are now neglected, frequently owing to the indisposition of some colonial governments to set up adequately equipped geological surveys and to the reluctance in some quarters to facilitate mining operations of any kind owing to their effect on depleted labour markets.

The paper itself was accompanied by four complementary essays produced under the authority of the Advisory Council on Minerals at the Imperial Institute, one on "Empire mining laws," by Mr. G. Stone; another on "Mica," by Mr. G. V. Hobson; another on the "Empire's tin resources," by Mr. R. Pawle; and the last on the work of the Mineral Resources Section of the Imperial Institute being by the Chairman of the Section itself, Sir Richard Redmayne.

It is too early to gauge the practical utility of this discussion from the business man's point of view, but one result of the presentation of this paper by Sir Thomas Holland will no doubt be a more intelligent demand by the interested public upon their respective Governments for the expansion of the existing geological survey and research organisations and a more definitely expressed demand for information of a more complete character regarding the particular country's resources in minerals, and the possibilities of exploitation, having regard to transportation, power, labour, smelter facilities, refining and manufacturing outlets, import and export trade in finished products, etc.

Following upon the official banquet on Tuesday, August 23, the Congress started out on two tours—the one westward to Victoria and back and the other following the same route as Tour "A" up to Cochrane, Ontario, and then striking eastward to Rouyn, Arvida, Thetford Mines, Sydney, and Newfoundland. The writer took Tour "A," but was enabled to inspect at a later date many of the mines and plants previously visited by Tour "B," together with some others not covered by either tour. In an article of this length one must allow it to be assumed that the party was welcomed with open-hearted hospitality at every place at which it touched, and the writer can attempt to deal only very briefly with some of the chemical and metal-

lurgical features associated with the mines, and concentrating and smelting plants visited by either of the two tours.

At Ottawa many took an opportunity of visiting the Chelsea and Farmers' Rapids plants of the Gatineau Power Company, a subsidiary of the Canadian International Paper Company, Ltd. (which has an immense new paper plant near Ottawa at West Templeton, Que.). These two plants, situated on the Gatineau River about seven miles from its confluence with the Ottawa River, are about 7000 ft. apart and work in parallel, power being generated at 6600 volts and stepped up to 110,000 volts for transmission. Chelsea is designed for an ultimate installation of five units of 34,000 h.p., and Farmers' for five units of 24,000 h.p., each having at the moment four units in place. The Gatineau Power Company, however, owns waterpower sites with an aggregate potential capacity in excess of 700,000 h.p., and its minimum present installation in the various plants linked up with its transmission and distribution system is 475,000 h.p., capable of generating from 1929 onwards approximately 2,150,000,000 kw.-hours, or 70% of the output of the Ontario Hydro-Electric Power Commission at the present time.

After technical sessions and a great banquet at Toronto, the Congress proceeded to the great steel plant at Hamilton, where the Steel Company of Canada, Ltd., manufactures most of the heavier products of the industry. The annual capacity of the Hamilton plant is about 290,000 tons, and the output comprises various grades of basic, foundry and malleable pig-iron, produced in two blast-furnaces, one being 73 ft. high and 15 ft. 8 in. in diameter, and the other 90 ft. high and 20 ft. 4 in. in diameter, with three McClure three-pass stoves and five two-pass combination stoves. There is also a large steel plant, rolling mills, and by-product coke ovens. The steel plant comprises eleven basic open-hearth furnaces, ranging in size from 25 to 70 tons capacity each; there is also one 100-ton mixer. The rolling mill equipment includes a 34-inch two-high single stand, reversing blooming mill. There are also billet and sheet bar mills, edging rolls, rod and bar mills, sheet mills, cold roll mills, a galvanising plant, and all necessary auxiliary equipment. The plant has a capacity of 300,000 tons of ingots per annum; 260,000 tons of blooms, billets and sheet bars; 150,000 tons of hot rolled products, including 90,000 tons of wire rods and 45,000 tons of merchant bars, and so on; the sheet mill has a capacity of 15,000 tons of black sheets for galvanising, stamping, forming back plate and blue annealed sheets; a spike mill can produce 93,000 kegs of railway tie spikes. The coking plant is equipped with 80 Wilmotte by-product ovens, having an annual capacity of 365,000 tons of coke; by-product ammonia is recovered as the sulphate, and there is a benzol refinery capable of handling about 2,190,000 gals. of light oils per annum. The company also operates another rolling-mill in Hamilton, the capacity being about 70,000 tons of rolled products per annum. Wire and wire products are turned out by the "Canada" Works, at Hamilton, which can produce 32,000 tons per annum.

(To be continued)
